THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII. NO. 2032. NEW YORK, JANUARY 5, 1889. PRICE FIVE CENTS. $2.00 PER YEAR.

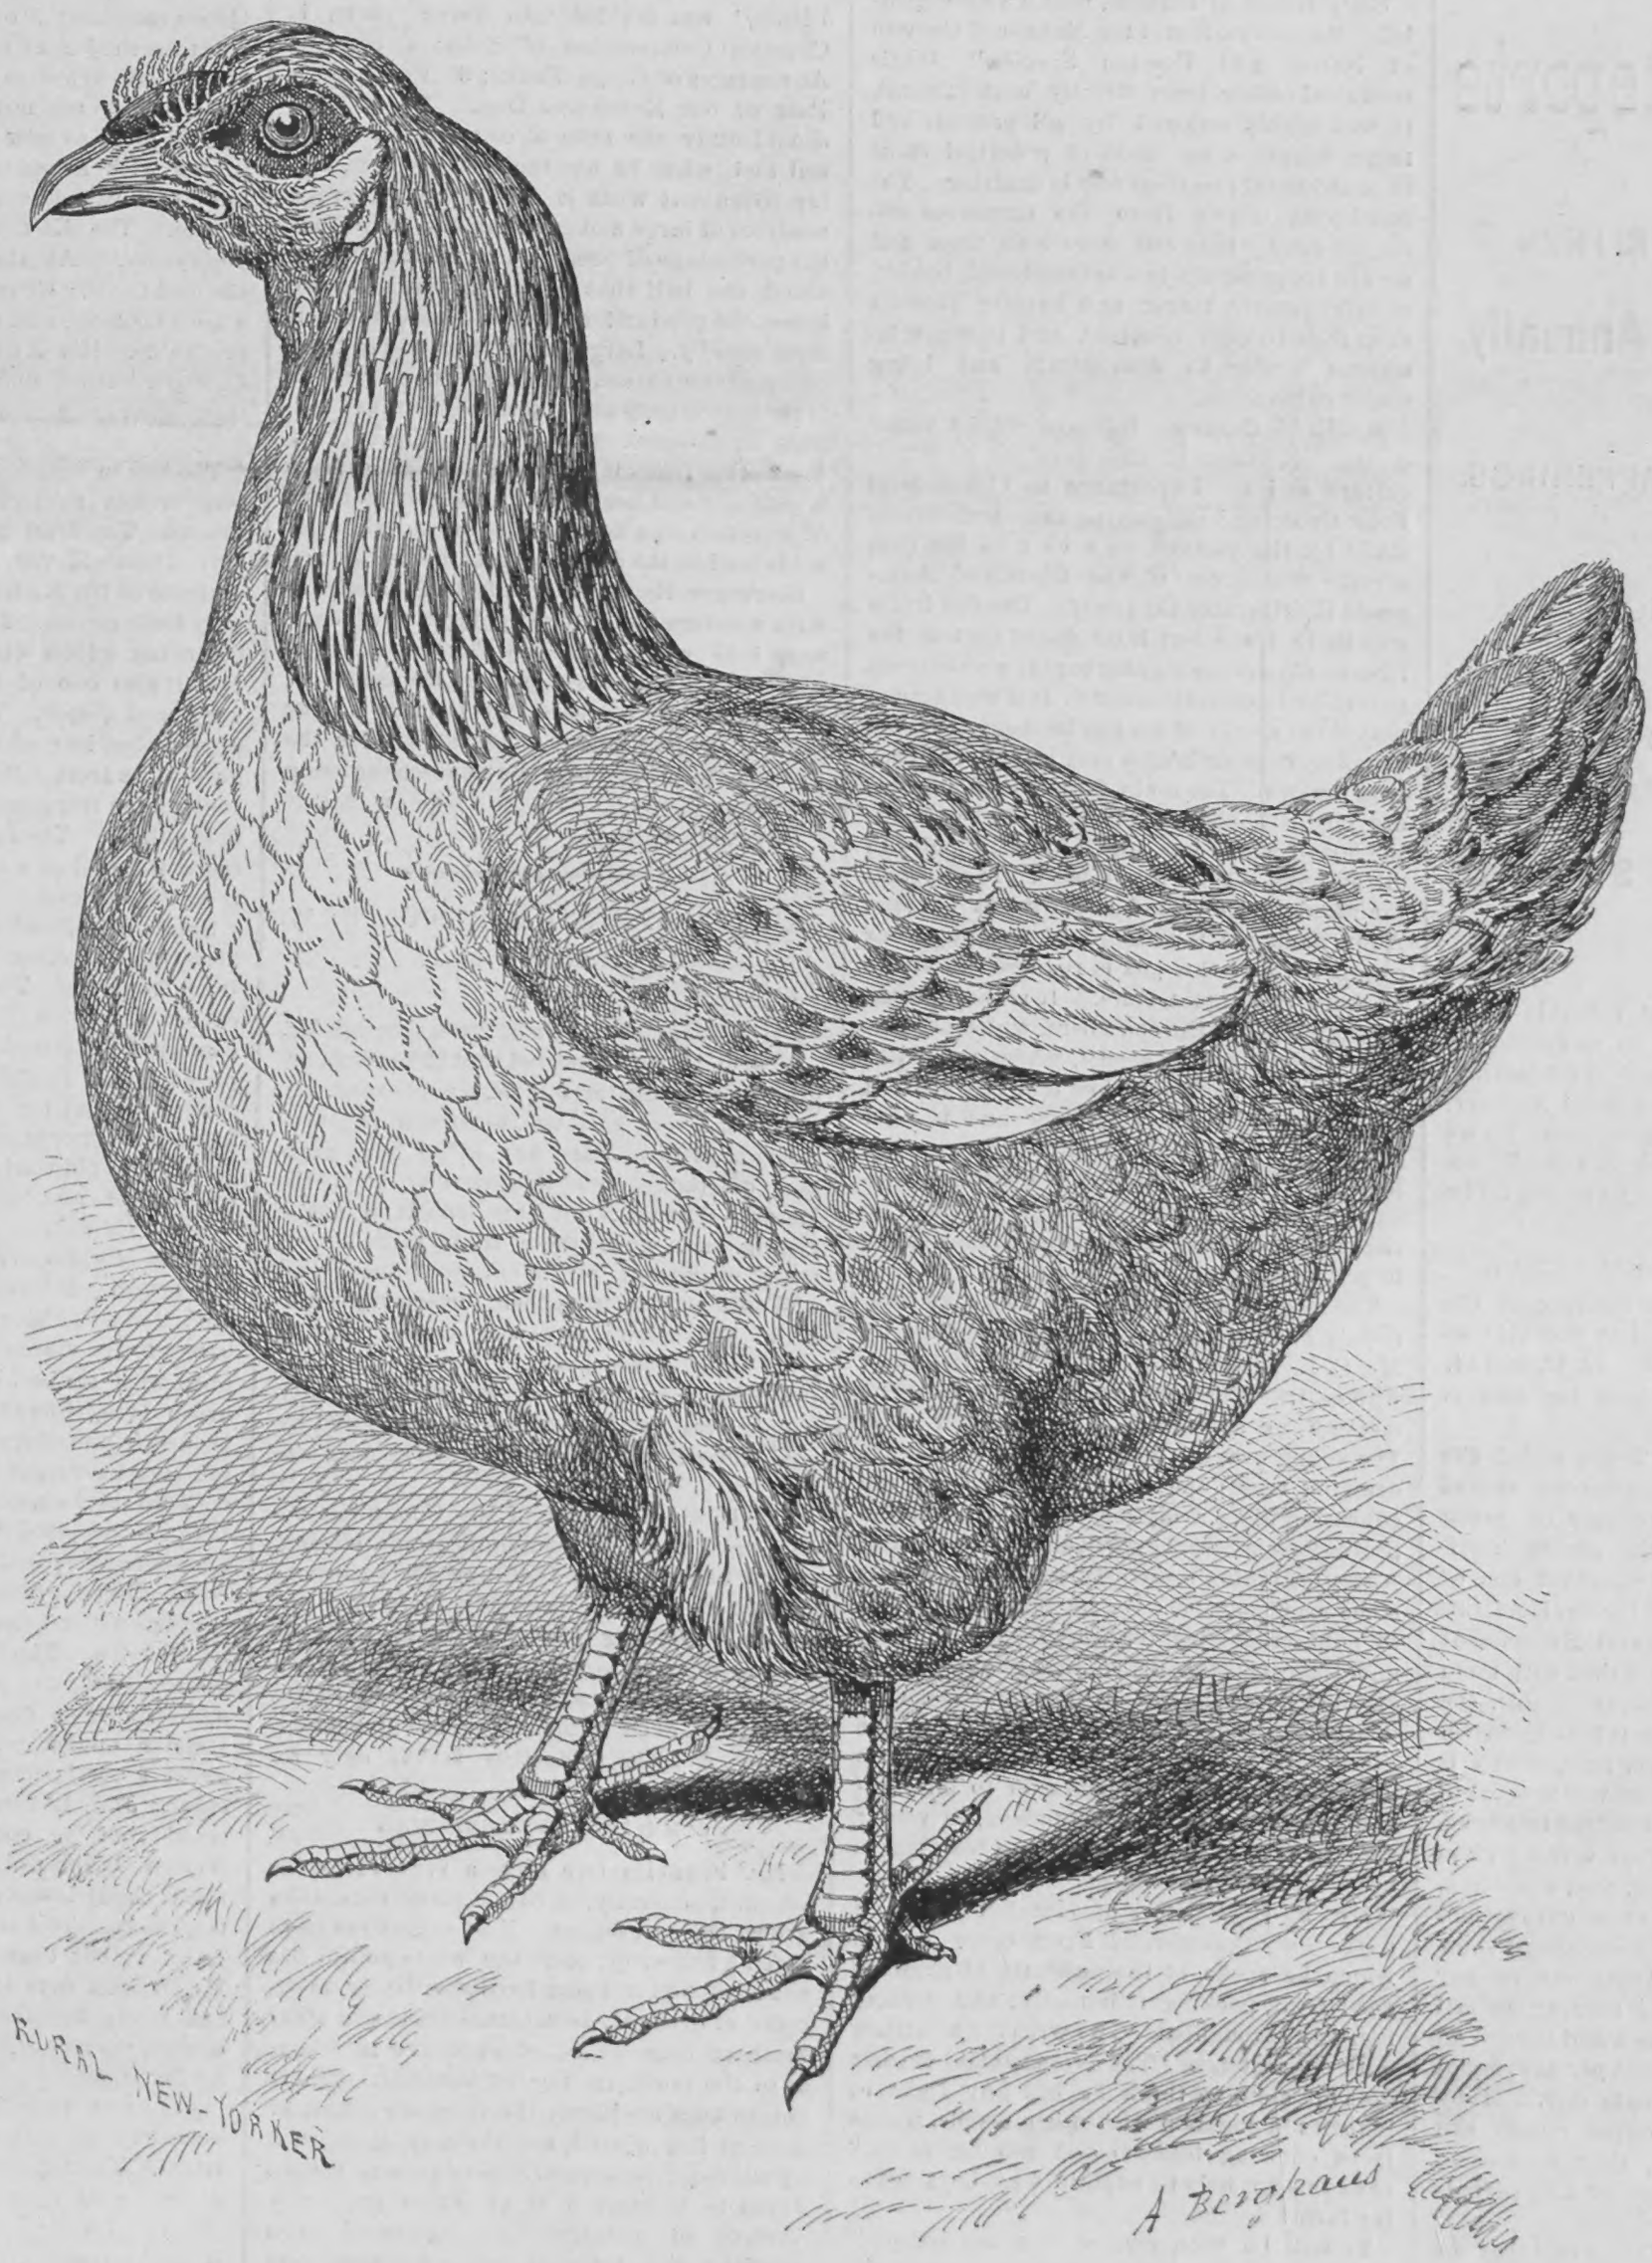
[Entered According to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

The Poultry Yard.

A SHAPELY PULLET.

WE begin the New Year by showing a specimen of the "new breed" we have frequently spoken of. Our readers will remember the story of our experiment. Last spring we procured a well-shaped White Wyandotte rooster and five White Dorking hens. These were kept in a pen by themselves and the eggs were carefully preserved for hatching. The chickens were of all colors, the whites being in the minority. Most of them had a trace of brown, the bird shown in the picture, see Fig. 1, being the darkest in color of the entire flock. We have selected her as coming nearest to the shape we have selected as our ideal. The square, "blocky" body, trim neck and short legs indicate, in our view, a serviceable hen for the general farmer.

We shall continue experiments with this cross. We care far less for color than for shape and laying qualities. We had hoped to use a brother of this hen in continuing the experiment, but as he was killed by a careless workman, we are obliged to select a new rooster and shall probably use a White Wyandotte.



ONE OF THE RURAL'S WYANDOTTE-DORKING PULLETS. From Nature. Fig. 1.

DISEASES OF FOWLS.

P. H. JACOBS.

THERE are so many diseases incident to poultry that it is impossible to describe the symptoms of all in a brief article. The disease most prevalent in the fall, winter and spring, is roup, which kills more fowls in this country than cholera and all other causes combined.

Roup is due to colds, and may be brought into the flock by contagion, by dampness, by exposure to winds, and by improper shelter. There are several forms of roup, but the signs are discharges from the nostrils, swelled heads and eyes, hoarse breathing, and whitish sore throat. When the eyes are swelled, bathe once a day with warm water, and anoint with a few drops of glycerine. If the bird breathes hoarsely, give a pill composed of equal parts of quinine, bromide of potash, and asafetida, the size of a bean, three times a day. If sore throat results, swab the throat with a solution of sulphate of copper. Add a teaspoonful of carbolic acid to each gallon of drinking water.

Cholera is always known by intense thirst, debility, an anxious expression and greenish droppings. The best remedy is to add a teaspoonful of liquid carbolic acid to each half-gallon of the drinking water, and give a mixture of 10 drops of paregoric and five drops of spirits of camphor, twice a day.

Gapes is the result of suffocation caused by a small, slender worm. Numbers of them cluster together. A drop of spirits of turpentine on a bread crumb, twice a day, is the best remedy. The vapor of carbolic acid will also cure the difficulty. Chicks only are subject to gapes.

If roup and cholera can be kept out of the flock, half the battle will be won. To avoid disease of any kind follow these hints:

Never have your fowls too fat, and you will seldom have cases of egg-bound, double-yelk eggs, or soft-shell eggs. Hence do not feed largely of grain.

Nearly all ailments are due to a lack of grinding material in the crop. Always keep broken glass, pounded crockery, or sharp, flint gravel within reach of the fowls. Cold draughts of air blowing across them, or down on them, will cause swelled head and eyes, and finally lead to roup. It is often the case that weak legs may be caused by high roosts, the birds being injured by jumping therefrom to the ground. When the roosts are low and a hen is unable to stand on her legs, remove her from the male at once, as the cause may be traced to him, especially if he is very heavy.

Feather pulling is due to idleness, and not to a lack of something in the food as many suppose. Active birds, if confined and not exercising, will pull feathers, but the habit is easily acquired from any one of the flock by the other members thereof.

Hens do not eat their eggs unless they learn the habit from having eggs broken in the nest. Never use stale eggs as nest-eggs.

A dust bath is the toilet of the hen. It is her mode of keeping her body clean. If given a dusting place she will keep the vermin off if you will keep the poultry house clean.

The great source of contagion is the drinking water. A sick fowl should never be allowed to drink from the same vessel with the others.

On very cold nights a large flock will be more comfortable than a small one, as there will be more warmth in the poultry house.

A crack in the wall, or a hole as large as the head of a nail, will cause more damage than if the whole front of the house is open, provided the rear and sides are tight.

Never give medicine to healthy fowls. Feeding sulphur and adding Douglass Mixture to the drinking water, should only be done when necessity requires.

v.48
1889
340515

Pale or dark comb is not a disease, but indicates that the bird is not well. A healthy fowl always has a bright, scarlet comb.

Salt is necessary. Season the food with salt whenever it can be done, but only slightly.

Crop-bound usually results from the bird eating long grass, old rags or rope, or some substance that stops the passage leading from the crop to the gizzard.

The best place for a sick bird is the bottom of a flour barrel, straw being used for bedding.

No gases arise from frozen droppings, but the poultry house should be cleaned daily, if possible, and dry earth should be sprinkled on the floor, which permits of sweeping the latter with a broom. Cleanliness prevents disease.

The combs will not easily become frosted on cold days if they are annointed with glycerine. Birds with large combs and wattles should drink only from vessels into which they can get their beaks alone. A hen with frosted comb will not lay.

Never use kerosene on the legs or body, as it often irritates and does damage.

Have roosts low. Many birds gradually droop and die from internal injury due to constant jumping to the floor from high roosts.

Indust'l Societies.

Readable Reports

WHAT WISE WRITERS

Aim to Argue Annually.

HORTICULTURAL HAPPENINGS.

DAIRY DOINGS.

AGRICULTURAL ASPIRATIONS.

SUNDRY SENSIBLE SYNOPSES

REPORTS of a number of valuable meetings have been sent to us during the past few days. This is the season for talking. As last week's RURAL was a Special Number, we were unable to print these reports. So we issue several of them together this week, believing that they contain many excellent bits of information.

OHIO STATE HORTICULTURAL SOCIETY.

THE twenty-second annual meeting of the Ohio State Horticultural Society was held at Troy, Miami County, on Dec. 12, 13, and 14. Everything conspired to make it the success which all declared it to be.

At two o'clock President Tryon called the meeting to order. The afternoon was almost entirely consumed in the reading of seven reports. The first and, to the general horticulturist, much the most important one of these was that of Mr. W. J. Green, Horticulturist of the Ohio Agricultural Experiment Station at Columbus. He said that with them irrigation had been found impracticable, the chief reason being that water is too expensive. One and one-fourth inch per acre, which is about the amount of a good shower is equal to one thousand barrels or one hundred two-horse loads, and costs in Columbus seven dollars and fifty cents. Mulching, too, sometimes fails. The best plan seems to be cultivation. Experiments in Illinois and Connecticut show that half an inch of rainfall may be saved per week from evaporation by stirring the soil every alternate day. A man and horse can cultivate two and a half acres per day, equal to five acres every alternate day. If by cultivation one inch of water per month can be saved from evaporation, there need be no fear of drought except at one or two periods like the strawberry season.

Reporting on fruits, Mr. Green said that the Jessie and Bubach strawberries are about equal for profit to the Crescent and are safe to plant. Itasca, Logan, Sunapee, and Monmouth should be returned C. O. D. whence they came. Jewell and Gold seem to have a weakness for good living. Carmichael is worthless.

Mr. E. H. Cushman from the grape-growing region east of Cleveland, reported that the crop of that district was about 500 carloads. Many growers realized no more than one and a half cent a pound on Concords and but little better on Catawbas. Euclid Catawbas sold this year in Denver, Colo. at 20 cents a basket, while two years ago they were worth more than that on the vines. The future of viticulture nobody knows.

In his report Mr. N. Ohmer, of Dayton, said he sprayed his apple trees just as they were going out of bloom with ten ounces of London-purple in 50 gallons of water, and was pleased with the results. He would not spray when they were in full bloom as many bees are thus killed. He considers 35 or 40 feet a better distance for apple trees than 30 feet. His orchard at the latter distance is crowded.

In the report of Mr. J. C. Albaugh, of Troy, prominent mention was made of a new strawberry, the Miami. It is large, dark-red, late, of good quality, a strong grower, and able to withstand drought and neglect better than others.

The reports were almost unanimous in placing Bubach at the head of the list of strawberries. Their general tone was indeed pleasant as there seems to have been large fruit crops in all parts of the State, making Ohio's Centennal year one of happiness to the growers and to the poor.

Sec'y Ragan of Indiana, read a paper entitled. "A comparison of the Manner of Growth of Native and Foreign Species." While botanical rather than strictly horticultural, it was highly enjoyed by all present, and might doubtless be made of practical value in ornamental plantings and in grafting. The conclusion drawn from the numerous examples cited is that our American trees and shrubs are generally less symmetrical, bolder, and frequently larger and hardier growers than their foreign relatives, and in many instances harder to domesticate and bring under cultivation.

Mr. E. H. Cushman followed with a paper on the "Relation of Refrigeration to Horticulture and its Importance in Commercial Fruit-Growing," embodying the observations made by the essayist on a visit to the cold storage warehouse of the Cleveland Automatic Refrigerator Company. The fine fruits seen there leave but little doubt that in the future, cold storage is going to play a prominent part in horticultural industry. It is well known that if the spores of rot can be kept from developing, organic bodies may be preserved for long periods. The main factors in doing this are coldness, absence of light, and dryness, the last of which has caused most difficulty in all systems where ice is used. The system practiced in Cleveland is briefly as follows: Aqua ammonia is reduced to an anhydrous condition; and this gas is reduced by steam pressure to a liquid state. It is then passed through pipes in the chambers, which are surrounded by dead air spaces, where it volatilizes and thus produces a low temperature. It then returns to the condenser and is used again. A very low temperature may thus be produced and maintained. Dampness, instead of causing decay, becomes condensed on the pipes. The system is probably the nearest to perfection of any yet introduced.

The most interesting part of Thursday forenoon's programme was a short address by Mr. C. E. Thorne, Director, O. Ag. Exp. Sta., who said: "Whenever we attend a farmer's meeting we see few but gray-haired men. The young men are not there. The cities are drawing them; the schools and colleges are educating them away from the farm into the professions, where they will enter a fierce race, whose beginning is poverty and whose end is a chance of success. We should do all we can to counteract this tendency. The opening and improvement of so many experiment stations have opened a new profession to young men, more lucrative than many of the literary ones. The Ohio Station, feeling its duty in this matter, intends soon to offer advantages, not attainable elsewhere, to young men desirous of getting practical training in horticulture.

Mr. F. R. Palmer, of Mansfield, read a paper on "Commercial Fruit Growing," in which he spoke of the necessity of growing good fruit, packing it honestly, and dealing honestly throughout. The writer was struck with one sentence, "The average Ohio farmer does not seem to think he has any right to luxuries in common with other people, unless it be chewing tobacco and paying taxes." Does this not help to explain why boys leave the farm?

It will be with sorrow that the horticulturists not only of Ohio but of her sister States learn of the positive declination of Secretary Campbell to serve again. For a number of years he has held this position and largely by his efforts the Ohio reports have become very valuable. We may feel glad, however, that he still holds a prominent place in the society, having been elected Vice-President. His successor as Secretary, is Mr. W. W. Farnsworth, of Lucas county.

After the election, Secy. Campbell read a valuable report on grapes. With him, as in Summit County, the Mills and Downing mildew badly. There were embodied in this report two letters from Mr. Geo. M. High, of Sandusky County, in which that gentleman says that, after careful experiments, he has concluded that the best remedy for grape rot is the following: Dissolve one pound of sulphate of copper (blue vitriol) in two or three gallons of hot water. When cold add one pint of spirits of ammonia. Pour off the clear liquid and add to what remains 20 to 25 gallons of water. Begin spraying about 10 days before blossoming time.

Mr. L. B. Pierce, Ornithologist of the society, read his long, carefully prepared, first report. He spoke of the scarcity of knowledge on this subject and of the great labor necessary in acquiring accurate knowledge of birds. He has no sentimental, poetic love for those feathered depredators, the robins and sparrows. The time seems to have come when small patches of raspberries or orchards of cherries cannot be grown on account of birds. These fruits must be grown largely as allowance must be made for depredations.

Prof. Lazenby's paper on "Some Lessons from the Chemical Composition of Fruits and Fruit Plants," was divided into three parts, 1, Chemical Composition of Soils; 2, Ulterior Advantages of Large Fruits; 3, Fruit as a Part of our Every-day Diet. Every man should study the natural composition of his soil and what he has removed from it, and try to make it what it should be. Average analyses of large and small apples show that the percentage of seed in the former is only about one half that of the latter. As we know, the production of seed taxes the soil most heavily. Large apples then add to their other advantages the fact that they remove from the soil only about one half as much fertility as an equal weight of small ones does. With other fruits it is the same. As a diet fruit is pleasant and healthful. It keeps the organs of secretion in a healthy condition, while its acids tend to the destruction of disease germs.

Secretary Ragan entertained the audience with a lecture on the great cold wave of January 1886 which froze the Florida oranges, illustrated by charts showing the center of low barometric pressure and the zero line at each of the eight-hour observations for the three days during which the wave was crossing the country. W. S. C.

Cuyahoga Falls, O.

NEW JERSEY STATE HORTICULTURAL SOCIETY.

THE General Fruit Committee, through Mr. J. B. Rogers, reported that the season, beginning with the terrible March blizzard, has not been a very good one, horticulturally considered. The blizzard had killed large numbers of that most mischievous bird, the English sparrow, but this benefit is not a lasting one, since these birds have shown their wonderful reproductive powers, and will soon be present in their former vast numbers. The season was very unfavorable to fruit buds. The pear crop was light all throughout the State; apples were generally a poor crop, while peaches were injured by cold and wet weather during the ripening season.

Mr. Taplin, in behalf of the Committee on Flowers, sent a communication stating, among other things, that new roses are more subject to mildew, probably on account of excessive forcing for stock; also that the chrysanthemum now gives the flower lover a chance to have fine flowers for some weeks after frost, even without the use of a greenhouse. A little protection is the only requisite.

COMMITTEE ON VEGETABLES.

Mr. Franklin Dye gives a very favorable account, generally, of the crops of vegetables grown the past season. Most vegetables have given a full crop; only the white potato has not done well in many localities, either on account of drought, as in Cumberland and other southern counties, or of excessive moisture, as in the northern tier of counties. Where potato bugs are plenty, the vines are generally more or less injured, and the crop diminished by the required applications of poison. Crown Jewel is mentioned as an extra good new variety of potatoes. Among sweet corn varieties the Cory lacked sweetness, and had an unusual tendency to be attacked by black fungus, and the crop was almost spoiled. Triumph and Minnesota can be recommended. Evergreen for late is all that can be desired. Rosy Gem and White Strassburg were favorites among radishes, and California Cream, was a pet among lettuces. Eclipse is yet the best beet; American Wonder and Bliss's Everbearing the best peas. Among red-fleshed melons the Emerald Gem and Princess take the lead, and Improved Early Hackensack among the green-fleshed sorts. The Rochester tomato has proved one of the best. The true, white-seeded Ice-cream is an elegant watermelon.

NEW FRUITS.

Dr. J. B. Ward, as a member of the special committee on trial of new fruits mentions the following:

Golden Queen raspberry very prolific, a strong grower, of excellent flavor. Its wonderful suckering tendencies, and its color are against it. Not good for market. The Crystal raspberry is four or five days earlier and handsomer, and of bright yellow or straw color; perhaps it is not quite so prolific. Introduced by Caywood. The Cohanzick strawberry is a complete failure. Fruit hard and very acid, and not to be recommended. The Minnewaski blackberry holds its own, and even improves on acquaintance. It ripens with the Wilson. Fruit larger, very sweet; vines very prolific and hardy even in exposed locations. No rust or double blossoms noted about it as yet. Holds its color well. Mr. J. T. Lovett says the market rejects all but a bright red variety. Fashion in a measure controls the market. The Golden Queen raspberry is only good for family use.

On the subject of worthy fruits new or old, Mr. W. R. Ward says that some of the old fruits which are not yet much disseminated are as good as new ones, and can often be grown with as much profit as any, new or old. Old varieties are often new to some people. The Kieffer has been growing in popularity. At the start too much was claimed for it. Growers now concede it to be a good cooking, and a good market fruit, and profitable. His Kieffers sold in market for $1.40 per bushel, and Anjou for $1.65. Yet the Kieffer, one year with another, produces double as much as the Anjou.

The loss in ripening is very small and the tree is not subject to much injury from insects. The fruit is valuable for New Jersey. Dana's Hovey is in many respects the opposite of the Kieffer—one of the oldest, yet very little grown. It is of highest flavor, and deserving widest dissemination. The Quinn pear is also one of the very best—late and a very good keeper. The Lawson tree is a good grower, but he could not say anything in regard to its fruit. Many strawberries have recently been introduced, but few are receiving field culture. The Jessie is one of them, doing especially well on a heavy soil. Its popularity is on the increase.

Shaffer's Colossal raspberry is discarded on account of its color. Cuthbert and Marlboro take its place. The latter is considerably earlier than the Cuthbert, hence does not come in competition with it; and is gaining in popularity. Fay's currant is sustaining its reputation and the claims made for it by its introducer or originator. He has some bushes three years old that yielded as much as twelve quarts each, and the fruit sold for 10 cents a quart. Of cherries, the Montmorency and English Morello are good, and yet not generally grown. Moore's Early grape is one of the very best early black sorts in cultivation. It comes to the market when that is yet unsupplied with grapes; or at the same time with green Ives, Champions, or Concords from Delaware and Maryland. Last season it sold in Newark for eight cents per pound, while Concords in their season brought only four cents. It takes the place of Ives, and is much better and more acceptable.

Mr. Beebe praises Grimes's Golden apple, that has never been pushed half as much as it deserves. The Wagener also is hardly disseminated, and yet it is one of the finest apples. He is disgusted with many of the Russian apples. The Canfield is a tough sweet apple, perhaps good to cook or for cider. J. T. Lovett thinks the Russian apples should not be condemned in this fashion. Yellow Transparent is good. Being asked about the Delaware Winter apple, he says he is quite confident that it is identical with the Lawver; but even this is not much known. Mr. Wilcox says it is a good keeping apple, but never becomes good to eat. Quailty always very poor. Grimes's Golden is praised by Mr. Lovett.

President Baird's address emphasized the necessity of selecting proper varieties of fruits. The tendency in horticulture is in the direction of quantity, rather than quality. He would like to see this reversed. Rubbish is not wanted in any market. The grower should also confine his efforts to an area tha

he can handle. The income from our orchards might in most cases be doubled by better care, more manure and better marketing. Select a good commission dealer and stick to him. He has sent his produce to the same firm for 25 years. The yellows are troublesome, yet New Jersey growers have now as many healthy, thrifty trees as at any time before. There are so-called yellows that come from want of proper care or proper feeding, and from other causes that can be remedied. There are also the genuine yellows so much dreaded, that we as yet know little about. Speaking of the matter of transportation, he calls attention to the concessions that the Association of American Nurserymen have obtained from transportation companies. This has not been done without considerable effort; but it should stimulate fruit-growers to exert themselves in the same direction. The States can do much to aid horticulture. The Experiment Stations have done much towards educating the people; for instance in regard to fertilizers. Almost every farmer now knows something about the three chief elements of plant food. The grape-grower finds himself face to face with the problems of excessive production of grapes, and unprofitable prices, and President Baird seems to see a ray of hope in the possible use that might be made of a large share of the crop in the manufacture of "new wine," (unfermented grape juice), so highly eulogized as a beverage and medicine.

THE PEACH YELLOWS.

Prof. Edwin F. Smith, of the Section of Vegetable Pathology, Department of Agriculture, has made the subject of peach yellows a special study, and came to prove to the New Jersey peach grower, by a long array of instances and statistics, covering large sections of Delaware and Maryland, that the true disease is not caused by lack of proper food in the soil (by soil exhaustion,) a fact which the progressive New Jersey peach growers have long since recognized. The results of the various experiments made by experiment stations, professors and growers are often conflicting. There may be a disease resulting from starvation, that somewhat resembles in its symptoms the true yellows, but which is curable by proper feeding. Commercial fertilizers have been largely applied to peach orchards, but as a cure or preventive they have no value. There are many authenticated cases where the application of kainit and muriate of potash did no good. The most that could be gleaned from the Professor's remarks, was that the nature of the disease has not yet been discovered, and that the Department cannot suggest a remedy. The investigator has not been able to find the incipient disease or its cause (fungus) by microscope or otherwise. He has succeeded in transferring the disease from one tree to another. The investigation is not completed, but the hope is held out that the Department, in a year or two, will be able to give us more definite information. This then leaves the whole matter in the old unsettled and unsatisfactory state. One member reports that he has used salt with good effects. Another member preaches against the practice of root-pruning, and considers it the chief cause of weakness and early decay of peach and pear trees.

INSECTS AND INSECTICIDES.

Geo. D. Hulst, Entomologist of the Experiment Station, holds to the opinion that injurious insects after all, are not an unmitigated evil. They make production a little more laborious, he says, and add to the chances of financial success for the careful man. We have yet much to learn about insects, and how to deal with them; but we are advancing. A knowledge of the life history of every insect is needed in order to show us at what stage of its existence—egg, worm or caterpillar, chrysalis, and perfect insect—we can take it at its greatest disadvantage. Of poisonous remedies the arsenical preparations answer the purpose for leaf-eaters in almost every instance. Kerosene and pyrethrum kill by contact. A mixture of the two kinds, however, Paris-green or London-purple with kerosene emulsion or pyrethrum), secures two chances to kill, and will be found most effective in many cases.

Mr. Hulst also states that we need stricter laws, or stricter enforcement of existing laws, against the destruction of birds. The demands for material for decorating female head gear have done more to strip the country of our song birds than the quarrelsome nature of the English sparrow. Among useful insect-eaters Mr. Hulst names toads, snakes, moles, the latter the only enemy that preys upon the rose-beetle when in the larval state. People should begin to fight insects at their first appearance, and not wait until they have grown numerous and destructive.

To the query; "Would you advise using Paris-green for the cabbage worm?" Mr. Hulst replied in the negative. Hot water, pyrethrum, and other non-poisonous remedies are good and effective. The inquiry after an effective remedy for the scaly bark louse was answered by Mr. Nicholsen. who recommends a solution of sal-soda—one pound to the gallon of water. If applied to the affected tree by means of a brush, the remedy will kill the bark louse. It is good for woolly aphis also.

RESPONSIBILITY OF NURSERYMEN.

How far should nurserymen be held responsible for the correctness of the stock sent out? Mr. Wilcox stated that nurserymen don't know half the varieties they send out, nor can they be sure of what their stock really consists. They buy young trees and propagate from them without hardly ever fruiting them. The nurseryman should not be held responsible if such stock does not prove true to name. Mr. J. B. Rogers said: "This is a question of law. Seedsmen were held responsible for the genuineness of their seeds, and are trying to protect themselves against oppressive responsibility by the disclaimer printed on each seed package. The law holds nurserymen responsible, as it does seedsmen, and if they desire to protect themselves, they should use disclaimers as seedsmen do.'

FIGHTING INSECTS WITH FUNGI.

The observation that many injurious insects are kept so effectively in check by diseases, has led to the idea of studying these diseases, and introducing them among insects in localities where the diseases have not yet appeared. This is ably advocated by Mr. Nicholson, who states that cabbage worms are not very destructive in Europe because a fatal fungus disease does not permit their rapid increase. All such fungi should be bred and spread among our healthy insect crops.

GRAPES FOR GENERAL CULTURE.

The following grapes have the indorsement of the society as the best for general culture, viz: Worden, Concord, Moore's Early (black), Brighton (red), Niagara and Empire State (white). It might be interesting to know whether the members who vote for Concord have given the Worden and Moore's Early a thorough trial.

EXPERIMENT STATION AND SOCIETIES.

Of the various lines of work that Secretary Williams thinks the Experiment Stations might do for the horticultural societies, one of the most needed and important is the analyses of all the kinds of fruits and vegetables. Ex-president Alex. W. Pearson, kept at home by sickness, sent a paper on the same topic. The discussions in our meetings, he says, sometimes serve to make a dark subject still darker and more confused. He has listened to the discussions on peach yellows until he now knows less about the subject than he thought he did years ago. The Agricultural Experiment Stations should act as referees. The Department of Agriculture has practically settled the question of curing or preventing grape diseases, yet there is plenty of work ahead. Other remedies, or better and cheaper ones may yet be found, and many experiments are still needed. Mr. Williams mentioned the great diversity of the composition of soil as a serious drawback to the success of the work of testing small fruits at the stations. Definite conclusions can hardly be reached.

CHEMISTRY AND AGRICULTURE.

In the course of a most interesting lecture on the Relation of Chemistry to Agriculture Dr. P. T. Austin, of the experiment station, stated that the mineral substances of plant food, phosphoric acid and potash, are held in the soil, and a loss is not liable to occur. Nitrogen when applied in excess, however, may filter through as through a sieve, and escape. Almost all fruit flavors in general use are made by the chemist, and even the finest of them, like pine-apple, etc., owe their origin to old cheese and a cheap acid. There may be a difference of flavor between two apples, but the chemist cannot tell this difference, chemically, or how the flavor gets there. Which substance shall we encourage? Which do away with? What is the relation of fertilizers to composition of plant, root, flavor? All these are open questions, and should be investigated by the stations. If we have a sick tree, we generally try to cure it by giving some food to the roots. This may be like feeding a sick man with a big dinner, and making him still sicker. It is not impossible that a cure might be effected by inserting some medical agent through the bark directly into the sap circulation. Here is another field for experiment. In conclusion Dr. Austin calls the attention of farmers and fruit growers to two substances which promise to rank high among destroyers of fungi and perhaps insects. Crude naphthaline, a waste product and formerly considered a nuisance, seems particularly adapted to kill the lower forms of life, bacteria and (not unlikely) insects. It is a harmless substance, insoluble in water so that it could do no possible injury if put into the soil occupied by roots of trees or plants, yet highly volatile. If placed under, or in the limbs of a tree, diseases and insects might be kept off by the atmosphere of naphthaline which would constantly envelop the tree. It costs only about 12 cents per pound, and may be bought of the N. Y. Coal-tar Co. The other substance is bisulphide of lime, which is produced in large quantities, and is a cheap and powerful deodorizer and antiseptic. It should be more largely used by farmers and fruit growers, as it has all the antiseptic properties of burning sulphur, and is more convenient and less risky to use. It might be tried as a fungicide for leaf diseases of plants, and perhaps as a preservative for silage, etc.

UNPARDONABLE PRODIGALITY.

Secretary Williams wished to protest against the prodigal practice of Americans in the exports of wheat and corn. The richness of our soil is sent to foreign lands, and our soils are left poorer in mineral elements from year to year. The wheat should be ground, thus giving more employment to American millers, and the flour exported, and the bran, which contains the mineral elements of plant food, fed to stock, and eventually returned to the soil. Mr. Greiner said this would be very desirable; but it takes two to make a bargain, and if we desire to effect a sale, one will have to sell what the other party wants to buy. Prof. Geo. Cook, of the Experiment Station, puts the blame largely upon the American farmer himself, who does not appreciate bran, cotton-seed meal, etc. as he ought, and is not willing to pay the prices gladly paid by foreigners. Cotton-seed meal as a fertilizer is worth all it costs. The most economic method is to feed these materials to stock, get 30 per cent. of their substance in the growth of the animal, and 70 per cent. in manure.

OFFENSIVE LAWN FERTILIZERS.

Mr. Williams and Prof. Cook united in protesting against the use of such bad-smelling and unsightly stable manures on lawns as could be noticed on the grounds around the State House where the meeting was held. Cotton-seed meal, bone dust and other commercial fertilizers might be used with just as good results and without offense to eye or nose.

NITROGEN FROM ATMOSPHERE.

In complaining that Americans do not make proper use of many of the waste products of manufacture, Prof. Cook also mentioned the great loss of ammonia driven out of soft coal in the coke works of Pennsylvania. No practical method of catching the escaping gas and utilizing it for manurial purposes has yet been found. It goes into the air, becomes carbonate of ammonia, and nobody knows whither it goes. Plants do not seem to get hold of it. The grass in that section does not grow any greener, the corn and wheat any thriftier. The soil there is poor anyway, and the large quantities of escaping ammonia are not improving it. It seems quite certain that plants do not absorb an appreciable amount of nitrogen from the atmosphere. If ammonia is in the air, it has to pass through the soil first before plants can get it and they absorb it through the roots. Mr. Baker says that if he applies nitrate of soda to the soil, in expectancy of rain, and it does not rain within ten days he receives no good from it. The effect is lost. [This is a mistake.—EDS.]

A GOOD POTATO CROP.

Mr. D. Aug. Vanderveer, of Monmouth county, who had planted one acre of Silver Lake potatoes (of Peerless shape and general characteristics), makes the following report: Two-eye seed-pieces were planted 16 inches apart in drills 2½ feet apart. The fertilizer applied was special potato manure; 600 pounds broadcast before planting, 400 pounds in the drills over the slightly covered seed, and 500 pounds around the hills at the second cultivation—1,500 pounds in all. The rows were slightly hilled after the last manure application. Blight struck the field before the crop was fully matured. Yield, 135 barrels or 370 35-60 bushels.

THE RURAL POTATO CONTEST.

Treasurer Jones who was one of the witnesses at the digging of the famous potato crop on the Rural Experiment Grounds, tells of the wonderful sight presented by the quantities of "enormous tubers rolling out of the ground," and speaks with especial warmth of the No. 2 now being disseminated. Dr. Ward inquired about the flea-beetle, as he is not satisfied with anything that has yet been brought out. Sec'y Williams says it shows preferences for certain varieties. In spite of all inquiries, however, not much new information was developed either concerning the flea-beetle or the potato blight which was so very destructive in many parts of New Jersey last season, especially in Monmouth County.

EXPERIENCE WITH GRAPE DISEASES.—Mr. Williams reports having made 2½ applications of Bordeaux mixture. He has had better grapes than last year, or in a long time before. None were left untreated. Col. Pearson's experiments in Vineland under the direction of the Department of Agriculture have conclusively shown that grape diseases are preventable by the proper use of copper sulphate preparations. Mr. Williams had to use one of the older style hand force pumps, as he could not get a perfect sprayer. Mr. Vanderveer has experimented with eau celeste, making the first application June 1st. but he could not see much difference. Mr. Williams recommends spraying or washing the vines with the Bordeaux mixture *now* and then again in the spring. The winter spores should be killed first. He has bagged Duchess before bloom, yet on some clusters every berry rotted. Some varieties when bagged before blooming formed perfect clusters; others did not, for want of proper fertilization. This depends largely on the vigor of vines etc.

T. GREINER.

AS A FARMER'S DAUGHTER SEES IT.

MY brother and I have just attended the farmers' institute held at Cortland, on Dec. 17 and 18. The distance, weather and condition of the roads made it impossible for us to take in the whole of it, so I shall not try to give a full description of the proceedings, but I'll tell you what I especially liked. First, Col. F. D. Curtis, the instructor, who filled the place of Sec'y Woodward, proved very conclusively that New York is a dairy State and gave valuable instruction in regard to food rations for stock, for different purposes. He is a pleasant and genial teacher. Silo and silage were thoroughly discussed and their benefits explained. The paper by A. Devereaux, on "Silage in the Dairy," was very interesting and practical. Prof. Ladd, of the State Experiment Station at Geneva, by the use of his charts made very plain the value of different kinds of food, and the proper combinations for rations. His paper was a little too learned for one like me, not versed in scientific terms, but his explanation of his charts, and his answers to the questions asked, were very clear. "The Horns in Relation to Milk and Butter," by Dr. Law, of Cornell University, was also very learned. But I would like to have placed some of our friends who told about the docility of dehorned and polled cattle, in the yard with a polled bull that we had on our farm a few years ago. I think one look at his monstrous head and wicked eyes, would have inclined them to edge near the fence. G. P. Squires, of Marathon, read an important paper on the "Breeding of Domestic Animals."

He dwelt on the folly of breeding from all kinds of stock with the expectation of getting all the good points and none of the poor ones; and on the folly of every farmer trying to raise a trotter. There was a short paper on "Potato Culture," by Robert Purvis, of Cortland, but dairying seemed to be the principal theme, and potatoes were forced to take the background. Perhaps their present low price had something to do with it. The institute was a success judged by the interest shown in the questions asked, and the number present in spite of storm. Mrs. Burnham, of East Homer, gave a very fine rendering of one of Will Carleton's poems at the close of the exercises. Now, just a little criticism on the friends who have so kindly given us instruction. I do not think they give farmers full credit for the improvement they have made and are trying to make. They cannot realize the difficulty and the obstacles farmers have to meet. The farmer with small means and old-fashioned tools and unimproved stock already on his hands, finds it hard and slow work to make the changes he desires. But it is a pretty slack farmer in these parts that is not trying in one way or another to improve. Just let people give us credit for what we have done and we will gladly receive all the instruction they have for us.

EMMA L. BLISS.

THE N. Y. STATE DAIRYMEN'S CONVENTION.

THE State Dairymen's Association met in Oswego on Dec. 11. After the appointment of committees, the work was commenced by a discussion of proper rations for fattening animals and in feeding for milk. A series of charts, which are to be exhibited at each of the institutes this winter, were hung up in the hall. The first of these shows the relative amount of food elements in each of several of the most common substances used in feeding. For example, one bar painted across the chart showed in red the relative amount of albuminoids in hay, or about 4-100 of its

length as hay consists of about 4 per cent. of that food element; 40-100 was blue to represent carbohydrates and 1-100 was another color to represent fat, etc. A second chart showed the proper proportion of these food elements for a complete ration, also in some improper but commonly used rations.

In the further discussion Col. Curtis emphasized the importance of feeding for a purpose. Let the ration be a properly balanced one and do not feed more nitrogenous foods or albuminoids than the right proportion, neither should one feed an excess of starchy matter, for all excess in either case is wasted. When corn-meal is fed alone one half is wasted, for there is not a sufficient amount of albuminoids to balance the starch and fat. This is undoubtedly one of the most profitable fields for the practical farmer to study. Tables showing the composition and feeding values of all the ordinary foods, have been published and a complete ration for a milch cow of 1,000 pounds' weight is about 2½ pounds of albuminoids, 12½ pounds of carbohydrates and about one pound of fat, in about 30 pounds of dry fodder.

In the afternoon Dr. Collier gave an address in which he said that there are 1,540,000 cows in New York State and if the destroying angel would pass over the land and with proper discrimination blot out one half of these, their destruction would be a great blessing to the farmers. Very many cows are kept at an actual loss. In 90 creameries and factories from which he had been able to obtain statistics, the returns to the farmer per cow ranged from $14.50 to $82.17, and the difference in the price of the yields was but little. The ratio given is as 1 to 5⅝. The loss was in the amount produced. The New Hampshire experiment station has shown the cost of a quart of milk from the best cow to be 1.55 cent and from the poorest cow 4.26 cents, the average being 2.74 cents, and this on a good ration. The cost of the milk from the best cow with the best ration was 1.32 cent, and that of the milk from the poorest cow with the poorest ration 5.35 cents per quart—400 per cent. in favor of the best cow with the best ration. It is a question whether the average cow produces over 3,000 pounds of milk per year, but that yield will not pay the cost of keeping. Throw out the poor cows, feed the others better and bring the yield up to 5,000 or 8,000 pounds of milk per year. The value of the grass crop in New York State needs emphasizing, for it is worth more than the cereals and is of greater benefit to the land. Do not sell hay, for you cannot get what it is worth to you as feed for your stock. Its manurial value is great—about $7.50 per ton. The encouragement is offered that N. Y. State farms are not, on the whole, materially losing in fertility, which cannot be said of Western lands. The Empire State is as good as any in the world for farming. The address abounded in statistics and was to the point.

Col. Curtis followed, and said the farmer should make up a proper ration for his stock which shall be, first, for maintenance and, second, for production of milk and butter. He mentioned the fact that at Cornell last summer at the dairy conference it took 15½ pounds of milk for a pound of butter; at Kirby Homestead, 16½ pounds of milk, and at another place 22½ pounds.

Prof. Roberts discussed manures, or, as he put it, capital stock, and urged that the fertility of the farm be not allowed to become exhausted. No man has a right to take from the capital stock in farming, for he is robbing those that come after him. In feeding stock to produce flesh and butter one should feed also for manure. Every ton of solid manure is usually worth from $3 to $4. Manure is usually worth half the cost of the food, but its worth depends upon the kind of food consumed. The Professor gave as a ration for a milch cow of 1,000 pounds' weight:

20 pounds corn fodder, worth	$.05
4 pounds cotton-seed meal, worth	.05
6 pounds wheat bran, worth	.06
2 pounds corn meal, worth	.02
Total	$.18

The manural value of this will be 11 cents, but if a ration is made up largely of straw, the manure is worth considerably less; 10 pounds of straw are worth about one cent, while 10 pounds of cotton-seed meal are worth 11 cents. The importance of spreading manure in the fall and winter rather than waiting until spring was fully emphasized. One had found a difference of fully 25 per cent. in favor of spreading in the fall. Prof. Roberts said that we should always spread manure in the fall and where there is a plant to grow, it will grow nearly all winter. Sow clover or rye in the fall, or some crop that will live through the winter, so that its roots may go down and take up and make ready the plant food for some other crop to be put on in the spring. The Lord manures in the fall and you cannot beat Him.

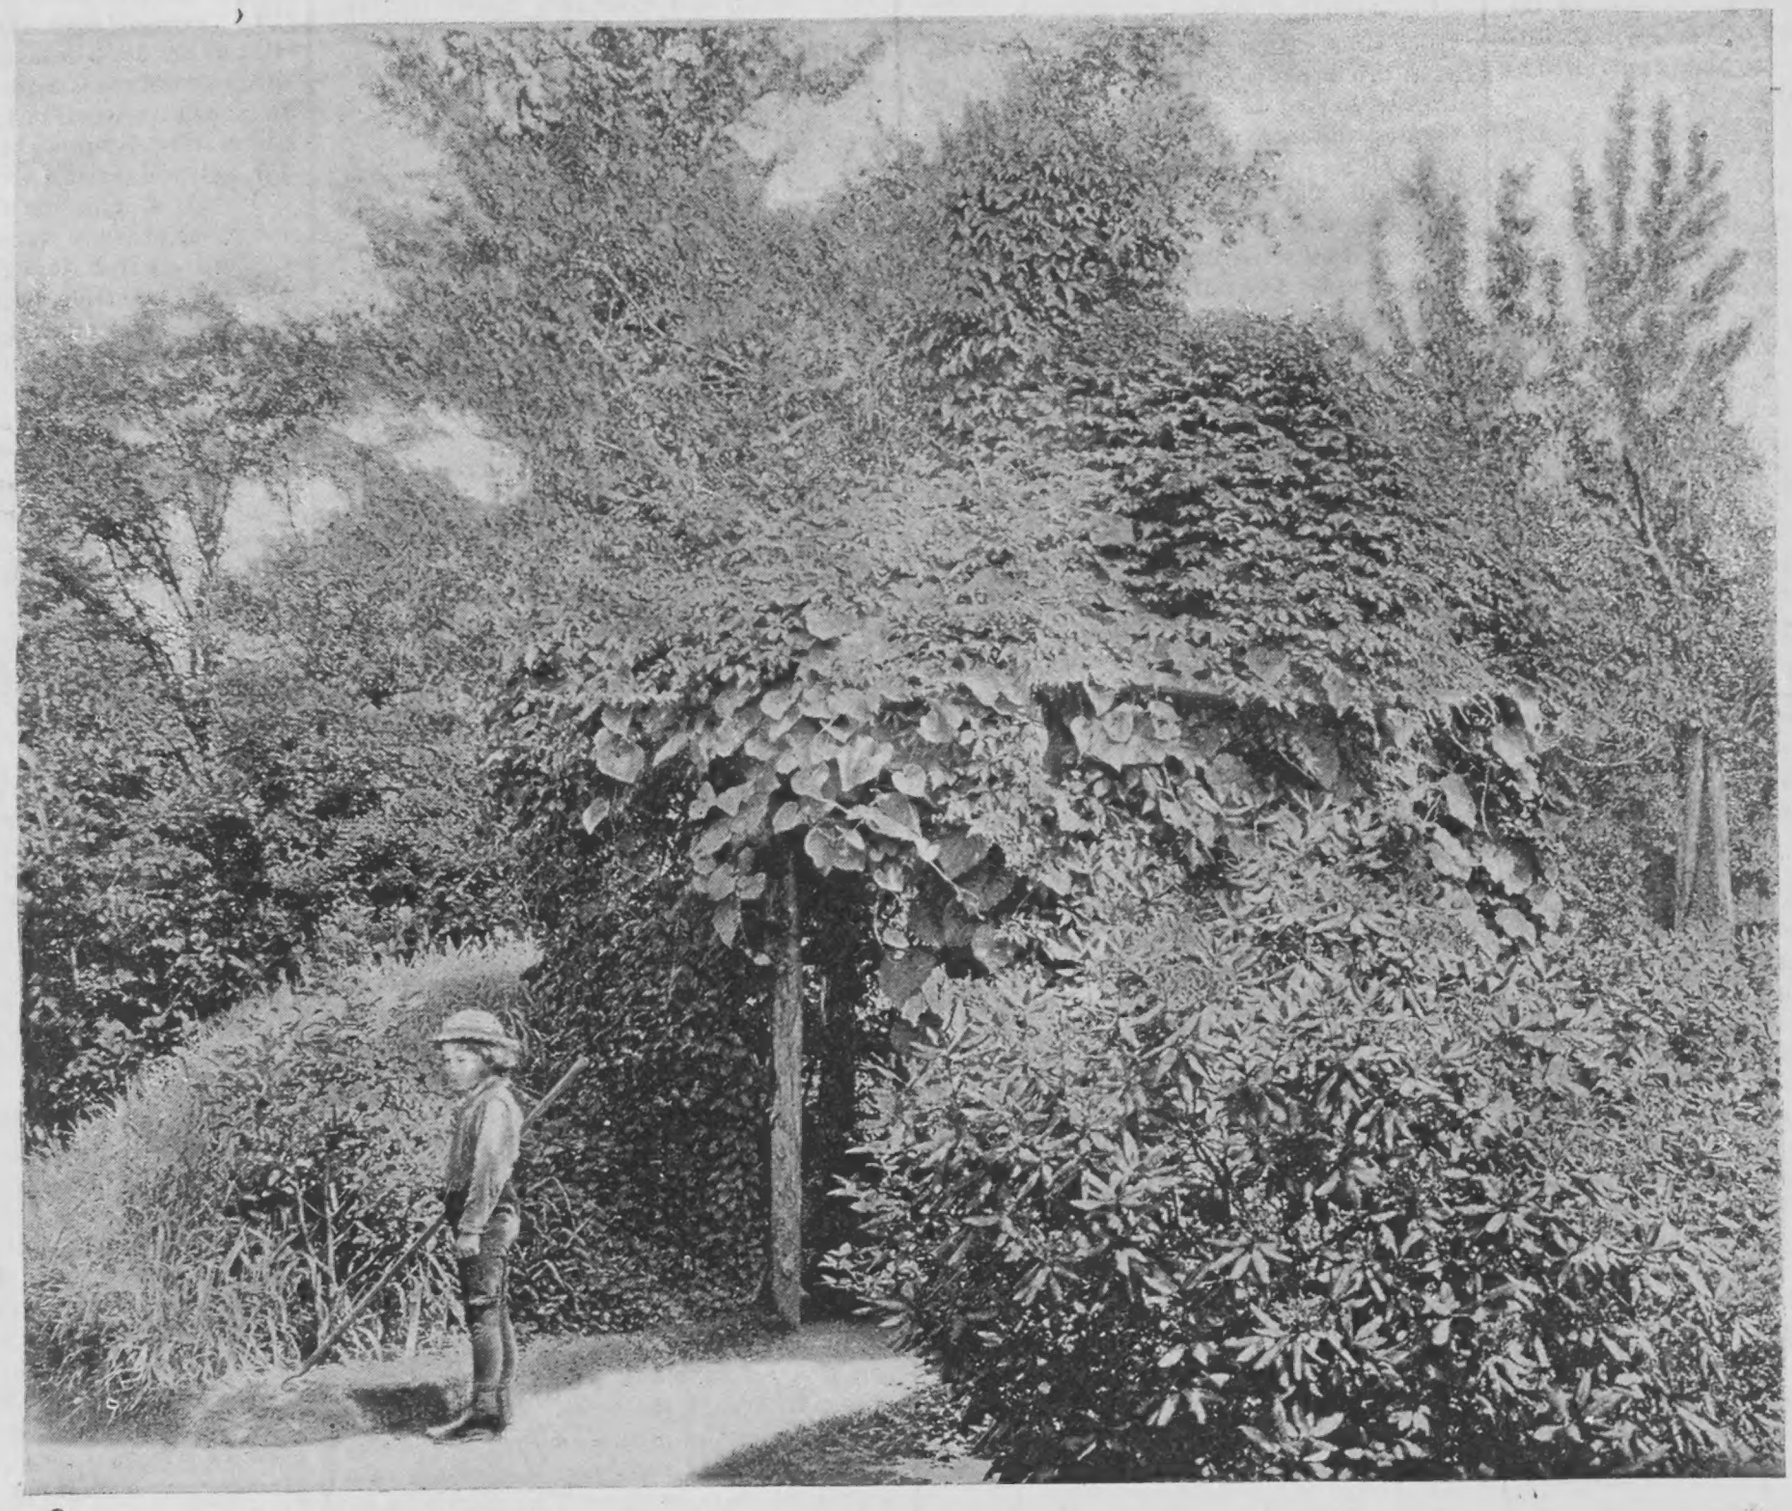
A paper was read setting forth the advantages of the thoroughbred sire and particularly of one from a long line of ancestors which have shown fine results in the milk pail or the churn.

Mr. Richards read a paper on cheese. He said set rules cannot always be depended upon in making cheese because conditions vary so much. The weather, the feed, the condition of the cow, the way the milk has been handled before arriving at the factory, all have an influence on the production so that a cheesemaker must understand his business thoroughly and must be a man of judgment or he cannot make good cheese every time. If the milk is right, is a pure and clean production, and has been properly aërated the cheesemaker can be properly held responsible. Aerate more and cool less. Throw away the skimmer and soon our cheese will have a reputation as good as that of Canada, and the home consumption will take all we make and at remunerative prices. Only 2½ per cent. of our dairy products are exported now. A good full-cream American cheese equals any made in Canada, and if we will banish the skimmer and insist upon a good cheese every time, our reputation abroad will come up to the best.

Dairy Commissioner Brown gave a good talk, during which he stated that there is but very little oleomargarine sold in New York State and none made there. The dairy products are to-day the purest articles of food offered in the markets of the State. The consequence is that the demand for fine dairy products is constantly increasing. There will be scarcely any limit to the demand for milk, butter and cheese, when all are perfectly fine products.

The little talk from Dairy Commissioner Brown was calculated to provoke considerable thought. Friends and neighbors wearing themselves out trying to pay interest, and stave off the foreclosure of the mortgage, and keep up respectable appearances, to send the children to school, and attend church and meet the reasonable requirements of such a course; and think of their working from four in the morning till nine at night and knowing all the time that they are waging an unequal warfare, is indeed sorrowful. It well represents the dark side of farm life. The importance of getting rid of the cow that gives 3,000 pounds of milk a year and replacing her with a 5,000-pound or 8,000-pound cow is self-evident. What a grand thing it would be if all dairymen would avail themselves of the information and the incentive for improvement which these annual meetings furnish.

Mr. Munson's paper on butter making was intended to be a little out of the old rut. The discussion which followed proved to be quite complete and brought out many questions. Want of knowledge is one important cause for so much poor butter. The young wife dislikes to tell her husband that she does not understand fully how to make good butter and so works on and makes a poor article. She ought to go to some good neighbor who has had experience, and who knows how good butter is made, and get her to tell how and show how it should be done. Deep setting is better than shallow. Thoroughly aërate the milk before setting in cans, by dipping from one vessel to another several times. Do not let the milk stand in the stable or in a room where it can absorb foul odors. Heat to 90 or 95 degrees before setting and cool down to 40 degrees. By so doing all the cream will rise in 12 hours. During a summer as cold as the past, milk will go down to 65 degrees before it would ordinarily be set. Use the thermometer and know what you are doing. If the milk is warmed much above 110 degrees considerable caseine is likely to come up with the cream, producing a butter containing cheese, an undesirable quality. Do not cool below 40 degrees in the creamer, for there is danger of injury to the butter. There are a thousand million fat globules in a cubic inch of milk. If the can of milk is set in very cold water the outside is soon cooled and there is a greater difference in the specific gravity between the milk and the fat globules. A slight current is created in the milk downwards near the outside, and a corresponding one upward toward the center, the upward current being milk and fat globules. This helps to get the cream to the surface. When the cream is taken from the milk it should be kept at as near the temperature of the milk from which it was taken as possible until enough is obtained to make a churning, then mix all together and warm to 62 to 70 degrees until fully ripened and slightly soured. It needs to come in contact with the oxygen of the air which helps to put it in proper condition. The best plan is to put the cream in large open pans, protected from the dust, etc., but exposed to the air. If set in pails, stir at least a dozen times a day. It will take about 20 hours to perfect the ripening process. Churn at a temperature, best determined by experiment, from 58 to 64 degrees in summer and 62 to 70 degrees in winter being about the range. Some creams must be churned at a higher temperature than others. There is such a thing as churning when the longer the churn is worked the further the cream is from butter. Under some circumstances the concussion may break the globules into finer ones. Some difference of opinion was expressed, but Prof. Roberts thought best to churn at as low a temperature as possible and get the butter in one hour. Others thought it better to get the butter in twenty to thirty minutes. The butter can be washed in the churn. Stop churning when the granules are about the size of grains of wheat. Draw off two-thirds of the butter-milk and add water at 55 degrees. There seems to be a little danger in cooling down too quickly to too low a temperature, keeping back a portion of the butter-milk in the butter, thus making an article of poor keeping qualities. It was not generally advised to salt in the churn, but to remove to the worker and salt there.



AN INEXPENSIVE SUMMER HOUSE. Fig. 2.

DAIRY SCHOOLS.

Col. Curtis presented his scheme for dairy schools. A lively discussion ensued, but all agreed that the plan was a good one. Col. Curtis gave a history of the efforts which have been made in this country to spread dairy knowledge, tracing the American Dairymen's Association from its birth until it disappeared and finally reappeared in the shape of the New York State Dairymen's Association. He also told something of what has been the effect of these meetings upon the people as an educator. Then followed an account of what has been done in the line of dairy education across the water. Not only Holland, Denmark, Norway and England are ahead of us in this line, but Prussia, Ireland, Italy and other European governments have established schools for the education of dairymen and maidens. Americans are far behind in this respect. Col. Curtis proposes that the State make an appropriation for the establishment of schools in some of the villages throughout the State, the scientific work to be under the supervision of a professor, who

shall teach the scientific side of the work, and the practical work to be under the supervision of a good practical farmer, who, working in harmony with the professor, shall teach the practical, the work of the farm to be performed by the students. H. H. L.

INEXPENSIVE SUMMER-HOUSES.

WE have talked in previous numbers of "nooky places;" of their importance in making grounds home-like, just the same as a room may be made cozy by nick-nacks, by pictures, by a clever arrangement of little interesting things that fill up without cluttering. It is easy to conceive of two rooms, one of which is furnished in the most costly manner without being cosy, the other of which is furnished in an inexpensive way and is still most restful and inviting.

It is just as easy to apply the simile to the grounds about our houses. There is nothing whatever about the Rural Grounds of a costly or pretentious character. Simplicity rules, and we have always thought that a great part of the praise which these two acres have received has been due to this one fact.

The vine-clad arbor and border surrounding it, shown in our photographic picture, Fig. 2, give us a forcible illustration of this principle. It was constructed about 15 years ago of Red cedar. It is octagonal in form, about 10 feet in diameter, with rustic seats around the inside and a rustic table in the middle. The entire cost for material and carpenter work was $12. Back of it is an old apple tree that serves chiefly as a support for vines. The Trumpet-creeper—most home-like of vines—and the Virginia Creeper, after climbing to the peak of the summer-house, have reached out and taken possession of it. The structure is a matted mass of these and also of the Dutchman's Pipe, desirable for its big leaves, rubbery stems, curious flowers and freedom from insects; honeysuckles, so fragrant in flower, so rich in their nearly evergreen foliage; clematis, which brightens all with its wealth of conspicuous flowers. Besides these, the Moon-seed (Menispermum Canadense) and the Celastrus scandens, so notable for its scarlet arils, help to make an entangled covering concealing all else from view. On the right of the picture is one of a dozen different varieties of rhododendron, growing in the crescent bed, selected for hardiness and for variety of color. On the left is a rock-work which, for the most part, has been taken possession of by the Ribbon grass (Phalaris arundinacea picta), so often seen in old gardens, and so valuable, too, as a part of semi-wild gardens or in half-kept, remote parts of grounds where plants are left to grow untrained—as if nature had placed them just there and was caring for them in her own unassisted way.

Everywhere.

RURAL SPECIAL REPORTS.

Nebraska.

WESTON, Saunders Co., December 11.—We have had one inch of snow to-day—the first this fall. Last summer was rather dry. We had just rain enough to make a good average crop of everything but wheat. We have not had a good rain since August 14. Hardly any fall plowing has been done, the ground being too dry. Corn is all gathered and farmers are busy marketing the crop at 20 cents per bushel. Feed of all kinds is plentiful, and stock of all kinds are doing well. Success to the RURAL! P. T. N.

New Hampshire.

KEENE, Cheshire Co., Dec. 10.—The hay crop in this part of New Hampshire was large, but on account of too much rain, much of it was of poor quality. Rowen was poor for the same reason. Rye and oats made a large growth, but were secured in poor condition. Potatoes, early varieties, a large yield, quality No. 1. Late varieties are in some places badly rotting. Corn, on account of the frosts on September 5 and 6, was very poor. Corn fodder is nearly worthless. Apples in some places are a full crop; in others half one. Pears, a very small crop. Plums, one-third of a crop; rotting badly. Grapes, an entire failure. There was too much rain this year; we have had more than 60 days of rain in the last 100.

Ohio.

GUYSVILLE, ATHENS Co., Dec. 15—Here in Southeastern Ohio the plow has become the land's greatest terror. With the exception of the river bottoms, its too frequent visits are unmistakably telling upon the once fertile soil, which is carried off in the loads and loads of golden grain and can not be replaced by a few sacks of "fosfate" sown broadcast. The incessant cropping, together with the reckless waste of manure, is fast impoverishing our soil; but it seems useless to raise a cry. Many will tell you it was only due to the season that their crops were not so good this year as last.

The great and unsurmountable difficulty here to-day is, to get and keep a good catch of grass. The writer, though young in years, can remember riding the mower in clean Timothy that stood as high as the horses' backs, but such growth cannot be made again upon the same land although it is in good hands. Why? Simply because the feeding qualities of the soil are to some extent exhausted.

The question here arises: Can this fertility ever be returned to the soil by the use of commercial fertilizers? I answer, yes, but it will force the owner to mortgage his farm.

Not only will he have to mortgage it, but the sheriff will foreclose the mortgage and some one else will have a rich farm.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

HOW OVER 100 BUSHELS OF SHELLED CORN WERE RAISED.

C. R. W., Westfield, N. J.—How did Mr. Henry Stewart raise over 100 bushels of shelled corn in New Jersey?

ANSWERED BY HENRY STEWART.

My first attempt to raise a large crop of corn was as follows:

A piece of old sod land containing four acres of light sandy loam sloping slightly to the south, quite free from stone, on my farm near Westwood, N. J. was plowed early in May, 1881; thoroughly well harrowed and 300 pounds per acre of the Mapes's special corn fertilizer were harrowed in. One half was planted with the Prolific Tennessee corn and the other half with a white corn from Long Island similar in all respects to the corn grown on the Rural Farm on Long Island. The corn was planted three feet apart each way. As soon as the corn was planted 300 pounds more of the corn fertilizer were sown broadcast per acre. The land was cultivated several times until it was showing the silk and the horse was hidden in the rows. This was all. Most of the stalks had two good ears; the Tennessee corn averaged three fair-sized ears and some stalks had three or four small ears in addition. The corn was husked by the bushel and was carefully measured by the husker in the field and by me as it was brought in. There were 398 bushels of ears of the Long Island corn and 412⅓ bushels of the Tennessee corn. The rows and cross-rows were finally counted, to be sure about the quantity of ground and measured 92 rows one way and 207 the other.

The next year the land that had grown the Tennessee corn was put in corn again, and with precisely the same treatment yielded 198 bushels of corn shelled, but there were not quite two acres in this piece; the rows were not the same as the previous year, being five less and were consequently a little further apart. The same year I had a piece of land in my garden (a very poor piece I thought), at my residence at Hackensack, N. J., 40 yards long by 20 wide, which had been in potatoes the year before; and was planted with the Prolific corn of seed from the previous crop on my farm. This ground was plowed with a Rue's hand-plow, by myself, and crossed; then raked smooth and marked out accurately in squares of three feet. Fifty pounds of the Mapes's fertilizer were raked in, and after planting, 20 pounds more were sown on the surface; 30 pounds more were used at intervals of two or three weeks, being sown through the rows before the cultivator (Planet hand hoe), was used. This land was cultivated every week, and as soon as the silks appeared the last 10 pounds of fertilizer were applied. This plot yielded 25 bushels 8 pounds of dry shelled corn, shelled in January; or nearly 151 bushels to the acre. My next crop—grown on the same land the next year—was Pride of the North corn. It was treated in precisely the same way; the summer was very dry and several smutty ears and stalks were destroyed as soon as they appeared: the yield was 14 bushels and a quart, equal to 84 bushels to the acre. One year since then I had 17 bushels on the same ground, equal to 102 per acre, the cultivation and fertilizing being the same. I grew corn consecutively on this piece of land, (a light clay loam rather damp and low) for seven years, when smut prevailed so much that I discontinued. The smallest yield during all this time was 80 bushels per acre. As my farm was devoted to dairying and soiling crops only were grown, I did not grow corn after 1882 there. In 1883 I had several acres of Evergreen sweet corn on the farm for market ears, and from one measured acre I picked over 11,000 ears, which is equal to more than 100 bushels per acre of ordinary corn. The same fertilizer and mode of cultivation were used, that is, the use of one half the fertilizer harrowed in before planting, a portion sown after planting, and the rest at intervals up to the time of silking; the crop was cultivated as nearly as possible once a week, it being the regular work for Mondays, weather permitting, until the silk appeared. I feel confident that the frequent cultivation and repeated fertilizing as the crop increases its demands for food are two most important requisites for large yields. I am still using (and always shall) this method of cultivating corn.

ASHES AS A FERTILIZER.

Subscriber (address lost)—1. I have a patch of Snyder blackberries which were set out four years ago on good corn ground, but which have never amounted to anything. They make a growth of two or three feet every summer, then die down, and never sprout. Would a dressing of wood ashes be likely to benefit them? I can get the ashes for a dollar a load, and manure for 50 cents; which would do the more good? Would the ashes be of any benefit to an old pasture, and when should they be applied? Will the Downing mulberry winter-kill here?

2. I have a patch of Black-cap raspberries that are set on loose black ground; they bore a very heavy crop this summer. As soon as the crop was taken off I cut the old canes out and put a large shovelful of wood ashes around each hill. What does the RURAL thinks of this plan?

ANS.—1. There is no better fertilizer than unleached wood ashes. The only trouble is that they have no nitrogen. Now if you will use the manure and the ashes, you will furnish all the land needs. We cannot account for the feebleness of your blackberries unless the soil is too impoverished. At such prices for manure and ashes, your farm should not suffer for food. Yes, ashes will help the pasture fields; but you should add nitrogen in some form. The best time to spread ashes is in the spring. Downing's mulberry will stand the climate of central and southern Ohio we should say.

FEED FOR SHEEP.

A. F. H., Dansville, N. Y.—I want to mix beans, middlings and oats in equal quantities to be fed to sheep; what amount should I feed per head, feeding twice a day? Could I make a better composition by increasing or lessening any of the above ingredients? Would corn be a better substitute for the beans?

ANS.—Sheep will not eat beans whole, and if mixed as above suggested the beans would be left unconsumed. At least the majority of sheep refuse beans when given whole. But if the beans are ground with the oats and the meal is mixed with the middlings, the whole will be readily eaten. As a rule, however, sheep will do better upon whole grain than on fine meal, which they are apt to bolt too greedily without mastication and so suffer from indigestion. At the present price of beans they cannot be fed with profit, but only at a large loss. A moderate allowance of oats or corn with good clover hay, makes the best feeding for sheep, and the cheapest at present prices. A sheep of 100 to 120 pounds live weight should have three pounds of hay and a pint of mixed corn and oats, or buckwheat added. Buckwheat, rye and oats are excellent grain food for sheep. When beans are discolored in harvesting and are thus damaged for sale, they may be usefully fed with corn to sheep or horses or pigs.

ABOUT PLANTING POTATOES.

A G. L., Sterling, Kans.—I have prepared a plot of about five acres for potatoes next spring as follows: I plowed it as deep as I could and subsoiled it six inches; not throwing the subsoil out. This stirs the soil 14 inches. Now what process would the RURAL recommend next spring before planting? I have two plans in my mind—one to plow the ground four inches deep and drop the potatoes in every third furrow; the other, to plow and subsoil again and pulverize the soil and then mark out and plant in furrows. Which is the better?

ANS. Our preference would be to plow a furrow both ways, leaving the equivalent of a trench a foot wide and six inches deep. We would drop pieces of not less than two or three strong eyes a foot apart, and fill the furrows by *harrowing*. Let the furrows be three feet apart from the middle of each. Before plowing the trenches we should again plow the land and harrow it, but omit a second subsoiling.

The R. N-Y. would be glad if in *one* trench he could use at the rate of 1,000 pounds to the acre of some high-grade potato fertilizer for comparison.

LAMENESS IN A HEIFER.

J. C. C. New Brunswick, N. J.—For four or five months a young heifer has been so lame in one of her fore legs or shoulder that she hasn't put down the affected member. The lameness came on gradually. There is no heat, soreness or swelling. She lies down most of the time. She is in good condition, and will drop a calf soon. What is the trouble; and how should she be treated?

ANS. Your description gives us no clue to the cause or location of the trouble; we cannot therefore advise as to treatment. Carefully re-examine the whole limb. Look especially to the foot to see that it is clean between the claws, and has not been pricked by a sharp-pointed body. Move each joint slowly backward and forward and endeavor to locate the seat of tenderness. If you cannot locate the trouble call a competent veterinarian to diagnose it and treat the cow for you.

COLD IN A HEN.

A. F. M., Martinsburg, Mo.—What ails my hen? She is laying and seems well except that every little while she shakes her head and says "pip." A year ago she and some of her chickens hatched from her own eggs were troubled in the same way; one of the chickens died. What can I do for the poor thing?

ANS.—The trouble is a cold which clogs the nostrils, the "pip" being simply a sneeze. It is due to a draft of air from some source, either from a crack in the wall of the poultry house or from a top ventilator. High winds will also cause it, or exposure to dampness. A drop or two of kerosene, injected into each nostril, will probably effect a cure if the hen is kept in a dry, warm place.

DUCKS.

C. W. E., (no address)—Do the Aylesbury ducks mature as early as the Pekin or Rouen, and which lays the largest number of eggs?

ANS.—With equally good care and feeding the Pekin duck will develop a greater weight at an early age than the Rouen or Aylesbury; but there is not much difference in the time of maturing between Aylesbury and Pekins, but, as the Pekin is the larger duck, it gets and keeps the earliest start in size. In regard to laying, the Pekin is the earliest and largest layer, but it must be remembered that feeding and care tell much more on ducks than on hens in the production of eggs, especially with the Pekin and Aylesbury.

THE RURAL'S CARROT CROP.

E. V. A., Bethlehem, N. Y.—What manure was used in raising the RURAL'S carrot crop, and how was it applied? When was the seed sown?

ANS.—Farm manure (20 tons to the acre) was spread in the spring and plowed under. It was harrowed well and then 400 pounds of Mapes's potato fertilizer were sown broadcast. The land was again harrowed and the seed drilled in very thick in drills three feet apart. The carrots were hilled up as they grew.

Miscellaneous.

W. S. Mc. W., Brooklyn, N. Y.—What variety of yellow corn will mature by September 10, if planted from May 25 to June 1?

ANS. Pride of the North will come the nearest to ripening in the time mentioned of any dent we know of. We should not fear to risk it It can be had of any seedsmen.

G. W. S., (no address).—A friend has recently brought me from England a few of the English Magnum Bonum potatoes for trial. Have they been tested in this country, and if so with what success?

ANS. Yes; the R. N.-Y. planted them when they were first introduced in England some 13

years ago. We have also raised many seedlings from this variety. All were worthless.

F. M. R., Fairview, Pa—1. What is the name of the inclosed wheat, which the RURAL sent out a few years ago in its Free Seed Distribution? 2. What is the name of a reliable dealer of farm produce in N. Y. city. also in Philadelphia, Pa.? 3. Can all the ladies who are members of a family where the RURAL is taken enter the Potato Contest?

ANS. 1. The wheat resembles "Surprise." 2. S. H. and E. H. Frost, 100 Park place or E. and O. Ward, 279 Washington street N. Y. Parcoast and Griffith, 122 Dock street. Philadelphia, Pa. 3. By all means.

W. C. A. (no address).—Can the common hickory tree be grafted with the Shell-bark hickory. If so, when should it be done, and in what way?

ANS. Yes, the hickory can be so grafted. The best method we know of is by the RURAL'S bud-graft method. The stem to be grafted is cut off horizontally. Then slits are made through the bark, as in budding, from the top down an inch or so. The cions cut on one side only are inserted and the whole covered with strong paper which extends an inch above the grafted stem. This basin so formed is filled with mud. It should be wet from time to time.

E. R. L., Clarion Co., Pa.—My mare has been lame in the left front foot for about three weeks. She does not limp at every step; she does so only when her toe or the right side of the foot strikes something. The day after she became lame I took her shoe off and wrapped her foot and pastern with rags which I kept wet with cold water for 24 hours. Then I set the foot in some wet cow manure for 12 hours. In a day or so I bathed the hoof with caustic balsam, making two applications 24 hours apart, and then two more, 30 hours apart, a week afterwards. The foot s worse if anything. I have not worked the animal since she became lame. She does not rest the foot in the stable but sometimes puts it a little in advance of the other. What can be done for her?

ANS.—You should have given a full description of the cause and nature of the injury or disease causing the lameness. We cannot tell what form you have been treating, and therefore cannot advise further treatment until we know the probable cause and nature of the trouble. Each of the various forms of lameness in the foot requires special treatment. If you will give a full description of the case we may be able to prescribe suitablo treatment.

DISCUSSION.

THE MAN FOR COMMISSIONER OF AGRICULTURE.

FRED GRUNDY.—I am glad to see the RURAL express itself in favor of a practical farmer for our next Commissioner of Agriculture. Its choice, Mr. J. S. Woodward, of New York, is a most excellent one. We do not need a personal introduction to him to be assured of his eminent fitness for the position. The great mass of reading farmers know very well that he is not a man who opens his mouth simply to put his foot into it. His utterances are invariably clear and practical, and prove him to be a man who is thoroughly informed on all matters pertaining to agriculture. Of course he is politically in accord with the President-elect, or the RURAL would not have presented his name. [That does not follow at all. We have mentioned a dozen names regardless of their politics.—EDS.] While the RURAL is not in any sense a party paper, I still think it would be remiss to its whole duty if it did not openly and emphatically advocate the appointment of a practical man to the one position which farmers as a class are especially interested in. That the office of Commissioner of Agriculture is connected with politics to a certain extent is a fact that there is no need to gloss over with varnish or cover with soft soap. There is nothing wrong in the Commissioner being a politician. He has a perfect right to belong to a party, and, when out of office, to vigorously work for the success of that party. The idea that the Commissioner of Agriculture should not have decided political opinions is simply silly. It is the idea of a lot of soothing sirup goody-goodies who are shocked at the shadow of a ballot, and of a class of low pettifoggers and paste diamond politicians who desire that he should be simply a good-natured old cove, with hayseed in his hair and corn in his pocket, who is handy to have about when the "rooral element" needs to be conciliated; a gentle, pudgy old chap, whose greatest delight it is to provide packages of turnip seed to be gratuitously distributed among "my influoential rooral constituents."

We need to smash that idea so everlastingly that it will never be heard of again. We need to demolish that free seed swindle so thoroughly that even its ghost will never reappear. We need a man that is not afraid to do it: a man who is honest enough, is politician enough and has grit enough to handle politicians without gloves, and to prove that a veritable farmer is neither simple-minded pig-headed nor inconsistent; who is not afraid to say that a swindle is a *swindle*, if it is sanctioned by Congressmen.

I think Mr. Woodward is the man who is capable of doing these things, and he is the man we should have. But he never will be appointed unless the class whose interests he will represent emphatically demand it. Ancient political hacks and theoretical husbandmen are serenely bobbing up in all parts of the country and almost moving mountains to secure the appointment. It behooves farmers to bestir them selves if they desire to be represented by a whole practical man.

FARMING DOESN'T PAY.

A. W., LITCHFIELD, CONN.—Under caption of the "Post Office Club" "Small Pica" gives a colloquy between the parrot which says "farmin' don't pay," and the "schoolmaster" who gives "facts" and "figures" purporting to show that farming does pay. The "schoolmaster" gives the value of the farms, farm machinery and live stock, together with the cost of fertilizers, the value of crops, of horses, mules, etc., including pretty much everything farmers have about them (or owe for) and then says "Farmin' don't pay, eh? What do you think of all this wealth then?" Now I would much prefer to figure as the "parrot," for I believe he shows more sense by far or more honesty than the schoolmaster. He at least sticks to an obvious fact. But how about the "school-master?" Think of enumerating the cost of fertilizers with the wealth of the farmer! Why not put in his *taxes* and interest money too? As to the value of farms, farm machinery, etc., if there's a "school master *abroad*" so lacking in honesty or sense as to claim these are a true criterion of the prosperity of the farmers, he ought to be trounced immediately and sent off to his own, the *politicians* who are seeking by such sophisms to silence the farmers. The truth is that such valuations show more truly what the *banks* and other money-lenders are worth, and what the *farmers* owe for and pay interest and taxes on. As to the value of farm products, if he will take their total value by his "census of 1880," subtract interest on capital invested and divide the remainder by the numbers engaged in agriculture, I think he will find that the farmers get, on an average, about $190 per annum with which to support and educate their families, and to buy the luxuries, the makers of which they are supporting in the "market." Though I propose to "stick to it," and fight monopolies and other iniquities, nevertheless,—"farming doesn't pay.

SALT FOR POTATO SCAB.

W. C. T., Harmony, R. I.—On page 816 of the RURAL, D. B. H., Delevan, Wisconsin, claims that one tablespoonful of salt dissolved in two gallons of water and sprayed on the ground, is a preventive of scab in potatoes and he asks me to try it. I am willing to try the remedy if D. B. H. will tell how many hills the two gallons should be applied to. He also found the same amount applied with Paris-green answered the same. Now I use a very fine sprinkler to put on Paris-green, and two gallons of water will cover from 250 to 300 hills. I do not think one-eighth part of it would touch the ground; applying one-eighth of a tablespoonful of salt to 300 hills of potatoes is very fine work.

R. N.-Y. We cannot see how the salt can have any effect in preventing scab, if applied in this way. If fertilizers are used—kainit, for instance—a comparatively large quantity of salt is applied to the soil.

SCAB IN POTATOES.

D. L. B., NUNDA, N. Y.—The RURAL asks some one's experience in using salt as a preventive of scab in potatoes. I have used salt for that purpose at the rate of 15 bushels to the acre, so that no weeds grew where it was used. It was applied two weeks or more before planting. Nevertheless I had scabby potatoes as usual. I do not think wire-worms cause scab on my potatoes. In fact, I know they do not. A close inspection will show small white spots all over the potatoes. These turn brown and increase in size and depth as the tubers mature. I have tried sulphur, lime, plaster, different fertilizers, both special and general, without any perceptible effect. They have been so badly affected some years that I did not pick up half of them; and the longer they are left in the ground the worse they are. I would like to hear the experience of others in the matter.

COTTON-SEED MEAL FOR MILCH COWS.

E. B. D., SHOREHAM, VT.—After a number of years' experience in feeding cotton-seed meal to milch cows I continue to use it. The cows have been very healthy. There has been only one case of abortion in more than 15 years in a herd of 35, and only one case of milk fever. The product has been very good. The production of butter ran as high as 325 pounds per cow in 1885, and 310 pounds in 1886, without grain in summer. I would not feed over two quarts of cotton seed meal per day with corn or corn and oat-meal—four quarts per day, fed at two feeds, with plenty of good hay and water twice per day.

BROWN SWISS COWS AS BUTTER MAKERS.

R. H. A., CHATHAM, N. J.—Is not the RURAL a little "rough" on the Brown Swiss cattle's butter capacity? On page 833 it says it takes 25 to 30 quarts of their milk to make a pound of butter. Mine will yield a pound to 12 quarts and I am milking about 20 thoroughbred registered cows and heifers. The RURAL cannot speak too highly of the Brown Swiss as the farmer's cow.

[R. N-Y. Our correspondent refers to a quotation made from the Farm Journal. Doubtless pounds should have been used instead of quarts.]

J. R. B., WELLSVILLE. KANS.—V. M. H Milford, Del., wishes to know how the ailanthus tree does in the West. In this part of Kansas it is a failure. It grows well while young, but when a few years old it loses all its vigor. The Early Harvest blackberry is as hardy here as the Snyder; it stands the climate as well. It ripened this year June 18.

The Luceretia Dewberry is a success here. RURAL readers should know that a hot-bed is the cheapest, safest and best brooder they can have. I never saw or heard of one being used until last spring. I made one myself. Our chicks were chilling to death. I set a large box on a pile of heating manure, banked it up and put some old sash on for a cover, and I never saw chicks grow faster or do better, At one end there can be a door and a run attached.

B. C. HAVERHILL, N. H.—I find feeding little potatoes to milk cows a benefit. I give about four quarts daily to each cow while on dry fodder. If too many are fed they will affect the milk so that it will be quite difficult to get butter from the cream.

What Others Say.

AN ENGLISHMAN'S NOTES ON AMERICAN LIVE STOCK.—Mr. MacDonald, a well-known live-stock authority and one of the editors of the Mark Lane Express, is now visiting this country. In a letter to the Express he says that the shortage of grazing steers on Western ranches, results mainly from two contrary causes. On the one hand, the spaying knife has been too freely employed; on the other, unusally large numbers of half-famished cattle—store cattle of all classes—have been consigned to the butcher during the past autumn. The spaying of heifers, like dehorning, has become a mania with Western stockmen. It is a sure and effectual source of infertility, but it is to say the least, a cruel, and superfluous practice. The operation is at once painful and revolting, and the results are only partially successful. while, unless a shrewd business eye is kept upon the condition and tendencies of the trade of the entire country it is very liable to be seriously overdone.

Mr. MacDonald desired to visit the wonderful ranching region of Texas. He saw a large number of cattle from some of the biggest ranches, which he characterizes as rough, ugly brutes. Many of them showed a slight departure from the original scrub, but at best they were very much inferior to what he saw even in Kansas, where Texan cows are extensively used for crossing with pedigree bulls. Yet he was told Texan beef is superior to that of improved and highly-fed bullocks, for the simple reason that it is raised under more natural conditions. Texan steers are wholly grass-fed, and although they do not attain to a high degree of maturity at any age, their beef is tolerably sweet. "But," said one of his informants, "we see little of it, and taste less; it is all shipped to Europe."

It is a national misfortune, continues Mr. MacDonald, for America that so little of the land is suited for the cultivation of roots.

No turnips, and only a few mangels are grown; and though there is a belief in some parts of England that these are not worth the trouble and expense of raising them, they form a very important ingredient in the cattle dietary. If American stockmen used more roots and less corn they would make fewer visits to England for breeding stock. Yet he has no wish to discourage their visits. It would be prejudicial to both countries to do so. If there is one point at which British and American interests become identical, it is in the matter of fine stock-breeding.

He believes that horse-breeding is likely to take a prominent place among the paying industries of the future. He might have said also the paying industries of the present, for it is at this moment the only branch of agriculture he thinks, that is yielding any substantial profit. In spite of bad times, everybody who has handled horses has had tolerably substantial remuneration for his labor There has always been a good demand for imported horses, and it would seem as if increasing. Phenomenal prices are seldom heard of, but for well-bred animals good round sums are given which enable importers to pursue their business with profit.

Notwithstanding the many hundreds of Shire and Clydesdale horses, and latterly Clevelands and Hackneys, annually landed, it is within the mark to say that quite three-fourths of the horses in America are of the Percheron breed or descended therefrom. The French horse Mr. MacDonald does not much admire, being very short in the quarters and rather bent in his hind legs. Yet the Percherons are useful stock. They are about the right size and weight for American tastes, though the heavier types of horses, such as the Shire and the Clyde, are being more and more looked after for horse-ranching purposes. The favorite type seems to be the thick, blocky horse—as square as a brick—with strong, short legs and good feet. For agricultural purposes, no horse weighing over 1,600 pounds is used to any great extent, the popular weight being from 1,300 pounds up to 1,600 pounds.

AVERAGE YIELD OF CORN PER ACRE.—The corn crop this year is the heaviest ever grown in this or any other country, amounting probably to 2,000,000,000 or at the rate of 32 bushels per acre. The yield in the Southern States averages 11 bushels in North Carolina, against nine bushels in South Carolina, 10 in Florida, 13 bushels in Alabama, 19 5-10 bushels in Texas, 17 bushels in Virginia, 11 bushels in Georgia, 19 bushels in Delaware, 25 bushels in Maryland, 19 7-10 bushels in Arkansas, 21 2-10 bushels in Tennessee and 26 7-10 bushels in Kentucky. Iowa is the banner corn State, in 1888 her average yield per acre being 37 bushels, against 27 7-10 bushels in Minnesota, 35 2-10 bushels in Ohio, 31 bushels in Michigan, 35 bushels in Illinois, 31 bushels in Wisconsin, 35 bushels in Indiana, 31 bushels in Missouri, 27 bushels in Kansas, 36 bushels in Nebraska, 28 bushels in California and 25 bushels in Oregon. The average yield in the New England States is 18 5-10 to 31 8-10 bushels, against 31 bushels in New York, 32 1-2 bushels in New Jersey and 32 6-10 bushels in Pennsylvania. Surely there need not be much improvement in agricultural practice to increase the average yield in some of the above States. Remember, too, these being average yields, the production on about half the farms in each State must be considerably below the figures given. Can such crops pay?

AVERAGE YIELD OF WHEAT PER ACRE.—In looking back over the year's work, it certainly seems that there ought to be little difficulty in increasing the yield of wheat, say by one bushel per acre. While in the United Kingdom the average yield for a series of years has been 28 bushels per acre, the average in the United States has been less than 14 bushels, or less than half the "Old Country" production. In view of the fact that the land there has been cropped for centuries, while much of our land is virgin soil or nearly so, such a great disproportion should not exist. This year the yield of wheat here has been unusually low, averaging only 11 4-10 bushels. The new States and the Territories make the best show; while the Southern States make the poorest.

Washington Territory yields 18 5-10 bushels, against 16 3-10 bushels in Oregon and 5 bushels in the two Carolinas. The average yield in New York is 14 1-10 bushels, against 14 6-10 to 16 8-10 bushels in the New England States, 13 bushels in New Jersey, 13 7-10 bushels in Pennsylvania, 12 6-10 bushels in Delaware, 14 5-10 bushels in Maryland, 8 7-10 bushels in Virginia, 9 5-10 bushels in West Virginia. The average in Georgia is 5 1-10 bushels, against 5 8-10 bushels in Alabama, 7 8-10 bushels in Mississippi, 11 2-10 bushels in Texas, 9 7-10 bushels in Tennessee and 9 7-10 in Arkansas. The winter-wheat crop in 1888 was far less than the yield of most of the previous years, being 11 2-10 bushels in Kentucky and Ohio, against 14 5-10 bushels in Michigan, 11 3 10 bushels in Indiana, 13 bushels in Illinois, 12 6-10 bushels in Missouri, 14 7-10 bushels in Kansas and 12 7-10 bushels in California. The spring-wheat States in 1888 had unpropitious weather, and the average out-put per acre is much smaller than usual,

being 11 8-10 bushels average in Wisconsin, against 8 7-10 bushels in Minnesota, 10 3-10 bushels in Iowa, 10 8-10 bushels in Nebraska, 16 bushels in Nevada and 9 2-10 bushels in Dakota.

PATENTS BY WOMEN. There are interesting spots in Patent Office reports even. One is the recently published information about women to whom patents have been issued. During the first 70 years of the Government but 55 patents were allowed to women; but in 1887 alone, 188 were issued, and the total is over 2,000. The first patent ever given to a woman was in 1800, when Mary Kies took out one for straw weaving with silk or thread. The second patent was issued to Mary Brush in 1815 for a corset. Probably the oldest woman inventor alive is Mrs. Nancy M. Johnson, who in 1843 patented an ice cream freezer and made considerable money thereby. Contrary to remarks frequently seen in print, most of the patents issued to women have been in some way connected with their dress and household labor-saving devices. Few of the women who have invented were from the New England States, and the most of the few were from Massachusetts

RURAL LIFE NOTES.

IF you have some choice retinisporas, arbor-vitæs, yews, junipers or other dense-growing evergreens, says Mr. Falconer in the American Florist, don't let the snow destroy them by weighting down the branches and spreading them apart. Just take a piece of marlin or stout string and run it in among the branches to tie them together and prevent their being spread apart by the snow.....

AT a recent Wisconsin institute, Prof. Short described the proper methods of handling milk and cream in order to make the best quality of butter. Cream not sufficiently ripened does not produce a good-keeping or good-flavored butter, cream too much ripened yields a bad-flavored butter. He cautioned the farmers not to put sweet cream in with ripened cream just before churning. No cream should be churned until it has been ripened at least twelve hours. The chief reason for butter not keeping well is the caseine which is permitted to remain in it and which should be thoroughly washed out before removing the butter from the churn.....

SUBMERGED setting of milk is preferable to any other system, as, if the milk is submerged promptly, and the water kept cold, as soon as drawn from the cow, it produces more cream than by any other process, and prevents contamination by any impurities in the atmosphere. Experiments at the station have proved that milk left out of the water ten minutes after being drawn from the cow lost seven per cent of cream, and that left out half an hour lost 30 per cent over that submerged as quickly as possible after being drawn. Not more than 60 per cent of the butter contained in it can be got out of sweet cream by any churning process. Sweet cream may be added to that undergoing the ripening process, but it should be well stirred up every morning; any cream ripening, unless a ripener is used, should be frequently stirred to keep the temperature alike through the entire quantity.....

THERE is no set method of telling when cream is properly ripened; the buttermaker must determine by experience the same as a good baker knows when bread is raised sufficiently to bake. The probable cause for having to churn for an unusual period before butter comes is the existence of albumen in the cream: to effect a remedy add a few quarts of water to the cream at the same temperature as the cream; let it stand a few minutes; churn again, drawing off the water from the bottom; if not successful repeat the process of watering, thus washing out the albumen. Salt in the water is advantageous, but not enough salt should be used to destroy the value of the buttermilk; put milk cans in ice water at any season to raise the cream, but do not let cream freeze.....

NEARLY $900 are thus far contributed in souvenirs to the Rural's Women's National Potato Contest. Let the good work go on....

THE Audalusian breed of fowls in the R. N.-Y.'s humble estimation, as judged from its present trial of the breed, is a delusion and a snare .....

A THREE OR FOUR-INCH tire is looked at by many rural travelers with something akin to amazement, remarks the Times. And yet such a tire not only does not damage a road, whether it be hard or soft, but it actually improves it, rolling it and making it hard, smooth and firm. And, moreover, the load is drawn with greater ease. In field work the advantage is equally great. The wheels do not sink through an ordinary sod and very little in a stubble, while two horses will draw 3,000 pounds of manure upon freshly-plowed land with four-inch tires to the whole when they would be stalled with 1,500 pounds upon 1½-inch wheels.....

TRUE it is, says the Breeder's Gazette, that the condition of the wool-grower is more complicated than that of his beef-raising neighbor. Wool is especially exposed to foreign competition, and for that reason needs and receives Government defence. In addition there is a menace against which no defence has thus been secured—in fact rarely asked for, if desired. This is the presence and steadily increased use of materials other than wool in the clothing of our people. Improvements in machinery, in the designing of fabrics, combined with universal demand for *cheap* products, have brought into common use a multiplicity of materials to displace fleece wool from its once almost exclusive employment in the manufacture of cloths, carpets, and other household fabrics. Cast-off garments now return to purchasers who demand cheap goods, for new service, and what sound, fresh wool that was not required to "carry" the adulterant, remains unsold until its owner accepts a price deemed all too low for its profitable production.....

THE English Society for the Prevention of Cruelty to Animals has lately prosecuted two farmers living in different parts of the country, for dehorning their cattle. The lower courts dismissed both cases and an appeal in one of them was made to the High Court, which also dismissed the case, allowing the defendant $26 costs. Three years ago—in 1885—the Common Pleas Division of the High Court in Ireland decided that dehorning was not an offense under the law in that country. As our readers will remember, a similar decision was rendered in Illinois some time back. The dehorners therefore need fear no interference from the courts.....

THE Commission appointed by the French Senate to study the consumption of alcohol in France says in its report that the recent diseases of the vine, such as phylloxera, have produced a complete revolution in the drinking customs of the French, spirits having taken the place of wine. Consequently there has been a great increase of insanity, suicide, and criminality. In Normandy and other northern divisions there is a public house for every sixty-two inhabitants.....

WORD FOR WORD.

CHRISTIAN UNION: "What is wanted is, not a labor system which will make the prison self-supporting—a matter of no pecuniary moment whatever—but a labor system which shall fit the convict to be self-supporting when he comes out of prison; a system, therefore, which shall be educative and not commercial—the end of which shall be the making of men, not the making of money. Such a system would not offer any such competition with workingmen outside of prison walls as would interfere with or tend to lower their wages."

——THE IDEA: "The peach crop for 1889 has failed."

——LONDON LIVE STOCK JOURNAL: "There can be no safety for British agriculture if, for the sake of the speculative minority who want cheap stores, we should again allow, even well-bred, well-fed, Transatlantic cattle to be distributed free over the country, carrying disease and disaster in their train. This trade will again, as it has done before, carry disease and disaster in its train."

——SWINE BREEDERS' JOURNAL: "The innocent purchaser of pork at the city meat market does not know if he is eating meat from a healthy porker or from one that is within a few hours of death's door with hog cholera. So extensive is this nefarious practice that many farmers will not under any consideration buy or use city-cured meats and lard."

——WEEKLY PRESS:—"A humane way of despatching an animal is to send a good-sized bullet into the center of the brain, paralyzing feeling at once. A handful of feed placed on the ground or floor before the animal is an aid in keeping it quiet so as to present a good mark. If the shot is properly placed the animal will drop as if struck by lightning and die in a few seconds without a struggle.

——"THERE are some honest commission men, but it costs money to find them."....

Miscellaneous Advertising.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

A NEW GATEWAY

BY the completion of a new bridge across the Missouri River at Rulo, Nebraska, the Burlington Route has established, for the entire distance over its own track, a new, direct, through line from St. Louis to Kansas City, St. Joseph, Atchison and Denver. Over this line is run "The Burlington's Denver Express"—a solid train with through sleeping cars and coaches from St. Louis to St. Joseph and Denver, and a through sleeping car from St. Louis to Kansas City. The connections made by this train at the Missouri River, at Denver and at junction points en route are such that one can directly reach by it all points in Nebraska, Colorado and all sections of the West and Southwest, as well as all Pacific coast points. This is in addition to "The Burlington's Number One" well-known solid vestibule train between Chicago and Denver and Cheyenne, with which direct connection is made by C. B. & Q. R. R. train from Peoria, and by which one can make the run between Chicago and Denver without being more than one night on the road. For tickets via the Burlington Route and for special excursion folder, call on any ticket agent of connecting lines, or address P. S. Eustis, Gen'l Pass. and Ticket Agent, C. B. & Q. R. R., Chicago, Ill.

Best Farmers

And largest railroads all over the United States use the BUCK-THORN FENCE.

"The Best and Prettiest."

I want about 1,000 pounds more Buck-Thorn. I have some up already, and consider it the best of any I ever saw or used. I have used two of the best barb wires, also plain wire, but the Buck-Thorn is the best and prettiest.

D. M. HOWELL, Cambridge, Md.

The BUCK-THORN FENCE CO., Trenton, N. J., will send Samples and Circulars free to all applicants

NEW YORK STATE AGRICULTURAL SOCIETY.

ANNUAL MEETING.

The Annual Meeting of the New York State Agricultural Society will be held at the Society's rooms, Albany, on WEDNESDAY, the 16th day of January, 1889, at noon.

W. JUDSON SMITH,
Secretary Pro-tem.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JANUARY 5, 1888.

NOTICE.

THOSE desiring to have seeds of any kind or plants of any kind tested by the RURAL NEW-YORKER will kindly send such seeds or plants to the Editor at River Edge, Bergen Co., New Jersey, and not to this office.

"*There are* 1,540,000 *cows in N. Y., and if the destroying angel would pass over the land and with proper discrimination blot out one-half of these, their destruction would be a great blessing to the farmers.*" So says DR. COLLIER on page 4.

HAVE the courage, even if only on one acre or, we may add, one-tenth of an acre, to try if more money cannot be made by making it richer than it is.

"*Farming is and must always be a close business; yet everywhere we find men who make a good living and lay up money at it. No business is good for all that are in it. Thought, prudence, patience, hard work—these are the qualities required to make farming pay, or any other business that is honest.*"—BUCEPHALUS BROWN, page 9.

THE RURAL NEW-YORKER is *invariably* discontinued at the expiration of the subscription term. Any of our readers, therefore, who do not intend to renew need not trouble themselves to inform us of the fact.

"*We need to demolish that free seed swindle so thoroughly that even its ghost will never appear. We need a man that is not afraid to do it: a man who is honest enough, is politician enough and has grit enough to handle politicians without gloves, and to prove that a veritable farmer is neither simple-minded, pig-headed nor inconsistent; who is not afraid to say that a swindle is a swindle, if it is sanctioned by Congressmen.*"—FRED. GRUNDY, page 3.

"PLEASE NOTE," says C. V. Mapes, "the unusual array of prizes offered in the country this season for the best results with potatoes. The one who obtains the largest yield of potatoes will receive almost enough to buy a small farm. This unprecedented interest in potato culture is largely due to the efforts of the RURAL NEW-YORKER." Thank you, Mr. Mapes, we think so too.

WE have been told of late of the labor to be saved by the use of various intricate machines. There is a lesson that should be enforced with this story. Take potato diggers, for example. The point to be remembered is that in order to make one of these implements work satisfactorily the land must be loose and fine and free from weeds and stones. These intricate machines require the best conditions for their perfect work. A potato digger such as Mr. Terry finds profitable, put into the ordinary potato field, would only cause vexation.

"*The farmer with small means and old-fashioned tools and unimproved stock already on his hands, finds it hard and slow work to make the changes he desires. But it is a pretty slack farmer in these parts that is not trying in one way or another to improve. Just let people give us credit for what we have done and we will gladly receive all the instruction they have for us.*"—EMMA L. BLISS, page 3.

HIGHLY favored are those country homes which during the wintry season, have evergreen trees so situated that whichever way one looks, the cheery green greets him. The contrast between country-home grounds planted with deciduous trees only, and those with a well-selected variety of evergreens, is very striking at this season of the year. The one is cheerless and we are tempted to shut ourselves up in the house, even in mild weather, because there is nothing to invite us out-of-doors. But hardy evergreens are always interesting and companionable.

THE RURAL has the kindest possible feeling towards the experiment stations. It is prepared to treat them fairly and to remember the fact that most of them will have to learn how to conduct themselves before they can be of much service to farmers. We have been glad to give space to farmers who have told what they want the stations to do and what plans they have to suggest. Fair and generous criticism is always valuable. It is the same with our farmers' institutes. One would think from most of the reports that these meetings are about perfect. We shall see about this. We have arranged with some practical farmers to tell us wherein they think these meetings could be improved so that they might reach a larger part of the farming community. Any of our readers who have anything to offer in this connection will be welcomed to the discussion.

WE have planted on our wheat plots at the rate of but 43,560 kernels to the acre; that is, one grain to every square foot. Now, a careful estimate shows that there are about 619,520 grains of wheat of average size, in a bushel, which would give only a little over two quarts of seed grain to the acre, instead of 48 quarts or more, as usually sown. Is the land (the R. N.-Y.'s wheat plot) well covered with wheat plants? Yes, fully as well covered as are the rye fields with rye plants. Very little wheat is raised about us. Rye is more profitable.

It is true that the RURAL wheats were planted in early September, while it is not the custom of the farmers to sow rye before late September or early October.

From the R. N.-Y.'s experience through many years, it is believed that *under certain conditions* a larger crop of wheat and a heavier kernel can be secured from two quarts of seed than from one to two bushels of seed. Can these conditions be economically secured? Probably not.

HERE is a letter from one of our lady readers in this State.

"It seems to me that the RURAL's cartoon of Dec. 4. is a one-sided affair. Why should that patient-faced woman who has toiled early and late by his side, who has endured all things, borne all things for his and sweet love's sake, be placed three steps below her 'lord and master', on a level with his sheep, his oxen and his swine. It looks to me as if such a man's thought could be voiced, instead of the sweet words of Old Hundred, we would hear something like this.

"Praise me, Oh woman where you stand,
I own all these, and this broad land
Is mine. Can't you the difference see,
While I own you, you don't own me."

I suppose the wife and mother might retort, 'I can have the use of my third, in case, etc., etc.' But she never will, for her standing there shows that plainly.

Yours for equal rights, a footing on the same plank, and the Potato Contest."

Now, here is a chance for the men to state their side of the case.

THE late Thomas G. Clemson was the son-in-law of the celebrated South Carolina statesman John C. Calhoun, from whom he inherited Fort Hill, the Calhoun homestead, which at his death, last summer, he left to the State for an agricultural college, together with personal property to the amount of $100,000. The testator was thought to be very poor and the heir to the estate was Miss Isabelle Lee, daughter of a New York stock-broker and great-granddaughter of J. C. Calhoun. Her father at once contested the will, and on December 18, Judge Simonson, of the United States District Court, granted an injunction temporarily restraining the executor of the estate from conveying the property to the State of South Carolina. The acceptance of the bequest became an issue in the last campaign and caused much bitter political recrimination. A large element in the State regarded accepting the bequest as robbing Miss Lee of her birth-right. The farmers of the State. however, have, almost unanimously, favored its acceptance. After many sharp debates it was accepted by the House about a month ago; but it was thought the Senate would reject it. Contrary to expectation, the Senate has just accepted the bequest just before adjournment, and now it is hoped by the opponents of the measure that the Governor will veto it. That it received the support of the farmers of the State will be to other farmers a pretty strong proof that it was a just gift: but the farmers of the State would pay dearly for it at the price of an injustice to any one.

LAST week the New England Tobacco Growers' Association, at its convention at Hartford, Connecticut, adopted a resolution asking Congress to impose a tax of 30 cents per pound on imports of stemmed leaf tobacco and of 20 cents on unstemmed. The tariff bill now before the Senate makes the tax on imported stemmed leaf 20 cents and on unstemmed 25 cents. The representatives of the growers vainly tried, the other day, to induce the Senate to raise the duty on stemmed leaf, and a Democrat offered an amendment putting it at 40 cents; but the Republicans refused to make any alteration in the bill. The growers' resolution that tobacco stems, which are used chiefly for fertilizing purposes, should be admitted free, also failed to meet with a favorable consideration. The fact is that tobacco growers are only a small percentage of the agriculturists of the country, and while a considerable proportion of these are opposed to tobacco culture on moral or sanitary grounds, the great body of them fail to express any interest in an industry which does not directly affect their own welfare. Hence the tobacco growers' legislative resolutions have not, as a rule, the powerful support of the great body of the agriculturists of the nation.

The Canadian Government has canceled 27 grazing leases, covering 700,000 acres in the Northwest, because the land was held by speculators who failed to stock their holdings according to regulations. This decisive action is warmly commended by the Canadian press and it is expected greatly to stimulate the ranching industry in that vast but undeveloped section, by forcing lease-holders to stock their holdings at once. American ranchmen, pressed for room in Dakota, Wyoming and Montana, are clamoring for admission to the Canadian ranching country along the frontier on the same terms as Canadians. At present a duty of 20 per cent. is imposed on American cattle imported into the Canadian Northwest, or, indeed, into any part of the Dominion. A quarantine of 90 days on cattle from this country is also considered a great grievance, as no contagious disease exists among cattle in the Territories from which importations are made, and rigorous laws in each provide against the introduction of diseased stock from other parts of the country. There appears to be little likelihood, however, that Canadians will make any concessions in this direction in the near future, although by relaxing the quarantine and remitting the import duty, it is very likely the vast unoccupied grazing areas in the Canadian Northwest would soon be rendered profitable by multitudinous herds of American live stock. The existence of these would be a great benefit not only to the Government, which would derive large sums from the rentals of the land, but also to transportation companies and commission firms, which would ultimately handle the stock on its way to market.

SELLING VEGETABLES BY WEIGHT.

ATTENTION was called, last week, to the fact that the N. Y. City Board of Aldermen have adopted an ordinance providing that vegetables and fruits must hereafter be sold by weight in this market. Last Saturday Mayor Hewitt gave a hearing to those who regard the ordinance as oppressive. A number of representative farmers and commission men took advantage of this opportunity to state their side of the case.

It was stated that the prime object of the law is to protect retail grocerymen who claim that they are being swindled by farmers in consequence of the lack of a uniform standard of weights and measures.

When shall vegetables be weighed? asked the committee of Mayor Hewitt. Nearly all sorts of vegetables and fruits are packed as soon as they are gathered—frequently during a rain or while the dew is heavy. Shall they be weighed while wet, or after being dried out? There will be a decided difference in weight. A barrel of potatoes may be over-weight in the morning, and so much lighter at night that the seller will be liable to a fine.

Again, who is to weigh and mark the thousands of packages of vegetables that are daily brought into this city? It will be necessary to create hundreds of little petty offices to accommodate these who must be "remembered" by city politicians. Business will be greatly delayed if everything must be weighed before being sold. and dishonest commission men will have new means of swindling farmers added to the already long list. Who that knows anything about the vast quantities of vegetables that are daily brought to New York, believes that every package and barrel can be weighed.

The law will surely divert business from New York. Brooklyn and Jersey City will reap the benefit of such a rule and the price of fruits and vegetables will be naturally increased to the retail purchaser, while the farmer will receive no more than at present. Farmers claim that there are too many "middlemen" between them and the consumers now. There is no one reason why hundreds of "weighers" should be added to the number.

Such were the main points brought out at the hearing. The Mayor has since then returned the measure to the Aldermen for slight amendments.

BREVITIES.

THAT public benefactor, John Burr, of Kansas, is now 88 years old.

DR. HOSKINS says potatoes want food "well cooked"—that is, soluble.

SEC'Y J. S. WOODWARD has entirely recovered from his late illness.

"*No business is good for all that are in it,*" So says B. BROWN on page 9.

Prof. Roberts says that the Lord manures in the fall and you cannot beat Him.

ONE of the lady subscribers who enters her name for the Potato Contest is 80 years old.

READ Bucephalus Brown's "Notions and Ideas" this week. It is full of sound teachings.

HOW to mix caution and courage in the right proportion so as "to bring luck." Ah! that's the rub.

"I THINK the women should do all the work except the team work, and even that if they choose. E. M. C.

THERE is nothing like utilizing waste products. A writer on another page tells how he made the escaping heat of a manure pile warm up a chicken brooder. What next?

IN dispensing hospitality, it is a pity we do not carry out the English custom of inviting people for just so long, specifying the time. So suggests Miss Taplin in her department this week, and the suggestion is an excellent one.

WE received on Oct. 1 or thereabouts, two Duchess pears of about the same size, weighing together three pounds. Each measured 13 inches in circumference. We regret that the name and address of the person sending them were mislaid.

MR. G. W. PECK, of Roselle, N. J., 16 miles from New York, reports that the August Giant is with him vigorous and hardy as to the plant. The berries are very large, but the quality poor. He has discarded Rogers's No. 15 (Agawam), as the berries rot and drop. Lexington (Miner), is not good for much. Carlotta (Miner), is a fine white grape ripening with Concord.

AT the Norwich farmers' institute a very lively discussion was held regarding the making of whole and skim cheese. One argument that seemed to meet with very general approval was to the effect that if only whole cheese was made the public would learn that cheese is really a good and valuable food and the demand would increase ten-fold. Who will object to this proposition?

The next meeting of the American Pomological Society, to be held at Sanford, Florida, next February (6, 7, 8,), will prove a rare chance for a full insight into the progress which horticulture has there acheived in a short period. We are glad to know that there will be no "formal banquet or speech-making, but instead thereof visits to the most interesting places." A few short, sharp, practical talks will be good, but deliver us from long-drawn-out essays. We hope that Pres. Berckmans will look to this. Cut off the long dreary talkers.

THERE'S a good deal of satisfaction, even to an unmalevolent mind, in seeing the biter bit. The Jute Bagging Trust affords such a sensation to the public now. A large proportion of the stock it cornered at high figures still remains on its hands, and there is almost a certainty that it can not get rid of it except at figures considerably below those at which the stuff was bought. The season's experience with bagging from pine fiber has been most favorable. It has been demonstrated that the article can be manufactured at almost any weight per yard. It will neither rot nor stain cotton. It can be manufactured and sold at a lower price than jute bagging, even should the latter be placed on the free list. There is little doubt that with improved machinery the manufacture of pine straw bagging will become a highly profitable industry in the South. The raw material costs absolutely nothing beyond the expense of gathering it from the ground and transporting it to the mills. How can jute bagging compete with it at the prices which jute bagging commanded even before the article was cornered?

Rural Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

WHAT ARE THE ESSENTIALS OF POTATO-GROWING?—If we are going in for big crops per acre—intensive potato culture, so to speak—it is very important to eliminate all non-essentials, since every part of the work will be costly. One of my neighbors, who reads the RURAL, and has been practicing mixed farming, tells me he shall put all his eggs into one basket next season, and plant forty acres of potatoes as his only money crop. He will use machines for planting and digging, and manure with chemicals only; and he will get through, with his crop turned into cash, by the end of September, and discharge most of his help then. He thinks he will make the most money this way; yet I cannot but have my doubts, though he is a good farmer, and potatoes are one of our surest crops. Yet I have rarely known a one-crop farmer to be successful in the long run.

BUT ABOUT THE ESSENTIALS.—Deep and thorough tillage seems to me to be the first, not only in time but in importance. The potato wants a chance to expand; and it can get it only by having its bed made deep and mellow. Then it wants its food plenty, handy, and well cooked—that is, soluble—and it don't want any help, in the shape of worms, to consume either the food or the crop. A large crop means a great deal taken from the soil in a short time—three months. Stable manure, if rich and fine, could not be bettered as a food for potatoes it it were not for the drawback of the scab-making pests with which it is so often infested.

WHAT ELSE?—A satisfactory variety being chosen, and the field being deeply mellowed and liberally enriched, how shall we plant? Shall it be hills or drills and at what distance? How deep? How much seed? How cut? Well, on all these points there are divided opinions; but the fact cannot be disputed that as large crops as are on record have been got from two-eyed sets, planted pretty close, the land being well prepared and well enriched. The best results I have seen have been from deep planting and level culture. This method makes rather hard digging, which is the only objection. There is less danger from drought, and no loss from green ends; but more are left in the ground, unless the diggers are very faithful.

THE CORN CROP.—I earnestly hope that corn-husking machines will prove a success and I wouldn't quarrel with the man who would bring me a machine that would give me, at the end of two days, my corn from twenty acres all husked, and the fodder crushed, cut and stowed away, even if he wanted four cents a bushel for doing it. It will cost a farmer in the East more than twice that to do it in the old way, and the fodder will not be in as good shape either.

DOES IT PAY TO GROW CORN?—I mean in New England. All our valley farmers think it does. Most of our hill farmers think it doesn't. On the high hills, or in the narrow, elevated valleys between them, the crop is too uncertain for its grain, though it is planted even there as a fodder plant. Wherever planted, a corn that will not ripen in any season but the most exceptional can hardly be made to pay unless through the silo. As a winter feed corn fodder requires too much handling, too much room, and is too subject to injury from mold and mice to be desirable on any large scale. The silo is the place for it, and perhaps only on light soils is it better than would be the same work and manure put into the grass and small grain crops.

DOES IT PAY TO GROW ANY GRAIN?—I mean in the same section. Most of our farmers would stare to be told that it does not, yet very few of them grow all they need. Under ordinary conditions if it pays to grow some, why does it not pay to grow enough? "Well, it takes too much help." Our farmers do not see their way to hire help enough to till any broad area of land at the present rate of wages and price of crop and products. It is a close business, without doubt. Farming is and must always be a close business; yet everywhere we find men who make a good living and lay up money at it. No business is good for all that are in it. Thought, prudence, patience, hard work—these are the qualities required to make farming pay, or any other business that is honest.

AND COURAGE, TOO.—Many a farmer who lives among the "ebbs and shallows" of fortune could do much better if he had more courage. But, ah! where can he get it? And how to mix caution and courage in the right proportions "to bring luck," says one who is looking over my shoulder. Many a farmer has tried to "branch out [a little" and has mired himself for life, and remained a warning to his neighbors ever afterwards. But when we look into it, we shall find, in such a case, that it has been into some "gambling crop," like hops, or tobacco, or small fruits—things that require expert knowledge, and capital to stand occasional bad crops or low prices.

TRY STANDARD CROPS.—When a farmer wants to broaden his business, let him begin with that part of it which he knows the most about. Then he will not be deceived by the glimmering haze that hangs over the unknown, and enlarges and distorts it to the eye. It seems to me that the remedy for that bugbear, high wages, may be found in making the same ground grow bigger crops. This is the safest place to enlarge, because it involves the least proportional expenditure. Have the courage, even if only on one acre, to try if more money cannot be made by making it richer, even if you have to buy the enriching material. This will be the only extra expense, except in the harvesting, for which the crop will pay.

APPLY THE SAME IDEA FARTHER.—Apply it to your stock. Have you the most profitable stock, or if you have are you getting all the profit there is in it? Try feeding the stock better as well as the land. Try improving your seed by selection or purchase. Try stopping all the leaks, one after the other—not by miserly economy, but by a wise attention to details. This is not speculative farming. This is not running an unknown risk. It is simply applying the old rule that, what is worth doing is worth doing well. I don't believe much in sticking up mottoes. They do not seem to make much impression. But I have known a word timely spoken to have a life-long effect upon the hearer. I once heard a boss mechanic say to his apprentice, in a wrathful tone, "D——n you, none of your 'bout rights'—is it right?" He did not even know that I heard him, but his fervor and emphasis drove a truth into my mind that has been worth thousands to me, whether it helped the apprentice or not.

Postscripts.

SHORT, SHARP AND SENSIBLE.

"I unhesitatingly say that warts need not prevent the sale of a good heifer. They are blemishes and their presence renders milking unpleasant to the milker and painful to the cow and would, if not easily removable, render her much less valuable than she would otherwise be. I would not hesitate any longer in purchasing an animal with warty teats, than would be necessary to give the seller time to determine how much less he considered her worth on that account, which generally is a good percentage. I would then purchase a pound of lard (if I had none or but little of home made) and by greasing the teats well after milking would in a few weeks look in vain for the warts, and credit the amount of purchase money saved to profit side of the profit and loss account. A heifer should be accustomed to having her teats handled before "coming in," and greasing them daily will not only remove warts but accomplish this object. I believe any kind of grease will answer; I prefer lard because it is less unpleasant for me to apply, and I keep it in a shallow tin box with a tight-fitting lid." C. A. U., Falls Church. Va.——"That bread conundrum was 'a hit.' My sister took the premium at the county fair—she is the *'flour* of the family.'—That first-page cartoon of December 15th!! We are still laughing with the man on the other side of the fence—though without 'enmity'—Miraculous escape, no bones broken." M. S., Oswego Co. N, Y.——"I had a P. Rock hen confined with her chicks. She began laying eggs while so confined, for two or three days. I found each day an egg in her coop; then she would cackle, but when I came for the egg it was not there. While watching her one day I discovered her destroying and eating the egg as soon as it had dropped. I at once determined to kill and dress her for the table. I put her in the corn crib intending to kill her the next day, but in the interval saw a number of addled eggs left by a hatching hen. I determined to try an experiment. I gathered them up and put two of them with the hen. She immediately set to work to break their shells, and did so—eating both of them. I then put four more addled eggs in the corn crib and left her. The next morning I opened the crib and found two eggs unbroken. I then put the hen in a coop, put two good eggs with her, but she refused to eat them and has not eaten an egg since that time." C. S. COOPER, Schraalenburg, N. J.——Our district bought a Vulcan Road Machine last spring. The roads were worked with it, as long as the appropriation held out, and they were left in a very much better condition than ever before. They were not touched during the summer or fall; they are, however, in better condition now than they have ever been at this season. I judge from this that the road machines make the roads good at the moment and make them so that they remain good much longer than when 'made' in the old-fashioned way. J. H., G. Queens Co., N. Y.——"No great loss without some small gain. Our corn did not ripen well this year. The wet weather kept it from hardening and the early frost killed the leaves so that the stalks were nearly worthless for feed without cutting and splitting. We made silage out of the dry stalks. You ought to see how the cows relish it; for we have the right kind of machine to make it and know how to make it." E. B. S., Hydetown, Pa.——"We can't get along without the RURAL; it beats them all; its best feature is originality; to a fruit grower, it is unsurpassed." T. S. Grimb.——"I have entered my name for the Potato Contest and expect to do all the work a woman can, even to driving the horse while a fifteen-year-old boy holds the plow. Because of this I think there should be two clases: one for all those who *oversee* the work, and the other for those who do all the work a woman can. I also wish to raise an early variety of potatoes." Mrs. D. L. B., Wilbraham, Mass.——"I farm because I love it. It makes me independent; it makes me money and enables me to provide for my family as I wish. This gives me pleasure; in fact I am a free man when I farm." T. A. S., Wartrace, Tenn——"A tool that saves us much labor is a potato separator, which was invented by a French Canadian farmer, nine miles from Montreal. It is constructed very much like an ordinary grain fanner without the fans. I would not be without one for a good deal, for when our potatoes begin to sprout in the spring we put them through the separator and it breaks the sprouts off and does not injure the potato in the least." .R B., Quebec, Canada.——

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

A HAPPY NEW YEAR; and may all our good resolutions be fulfilled! We are all making them about the 1st of January, and we are most of us breaking them all the rest of the year.

* * *

A beautiful table cover is made of cream-white corduroy. It is lined with golden-yellow sateen and finished all around the edge with gold-colored silk cord.

* * *

A NEW and pretty idea is to cover the little occasional tables with chamois leather. It is put smoothly over the top, and either painted or gilded in some simple design. One very pretty decoration is of pansies, the edges outlined in gilt. Straggling dog-wood flowers, connected by gilt circles, make another pretty decoration. A pretty way of finishing the legs of these tables, when of the tripod shape, is as follows: A width of China silk is tacked smoothly around the edge of the table; the bottom is gathered, and tied with a bow where the legs cross. Around the edge of the table is a row of small tassel fringe, such as is used to border curtains.

* * *

PERHAPS one of the rules for good manners more honored in the breach then in the observance is the assurance that independence does not mean impudence. A great many seem to have the idea that if they show complete disregard for the feelings of others, they are vindicating their own position. They are ostentatiously familiar with those who may be considered of social superiority, and rough or contemptuous to those less fortunate. We all know people of this type; pity they are so plentiful. If only they could learn that courtesy to all alike is the first rule for good-breeding. But they never do.

* * *

IN dispensing hospitality, it is a pity we do not carry out the English custom of inviting people for just so long, specifying the time. Thus, in wording the invitation, say the day of arrival and departure, whether it is a few days, a week, or a month. Nothing is more exasperating to a hostess who has certain duties for certain times than to have self-invited guests quarter themselves upon her for an indefinite time. There is nothing inhospitable in the English custom though many seem to think so. Mrs. A. may invite Miss B. to spend a week with her from the 20th to 27th, and she may then make her arrangements to entertain her guest. But if she asks Miss B. to come on the 20th and make her a visit, the hostess may be obliged to put off all her arrangements through the uncertainty as to the duration of the visit. It is far better for a guest to leave regretted than to outstay her welcome.

* * *

THE most exasperating invitations we ever receive are those asking us to come and make a visit some time. This may be repeated until we decide to accept it, and we then learn that "some time" means no time at all. It is proper to be thoroughly explicit; ask your friend to visit you at such a date, to stay so long. The guest, for her part, should state at what hour she will arrive, and at what hour she will leave. She should in all cases conform as much as possible to the usages of the family. She should be punctual at all meals, and, if she is wise, will make some excuse for solitary occupation—letter writing or the like—every morning, thus giving the hostess an opportunity to attend to personal occupations. She will enjoy her guest's society all the more when it is not made a burden upon her. Half the science of entertaining consists in knowing when to amuse people and when to leave them alone.

NELLIE'S NEW YEAR'S EVE.

"THE WAY THE LORD HAS LED ME"

NELL looked quickly up. Grandma's hands were folded over her knitting lying on her lap. Her eyes (turned toward the western window through which the setting sun was casting bright farewell glances) had a far-away look. And Nell knew Grandma was living over again the bygone years.

She softly crossed the room, seating herself on the low footstool at Grandma's feet, and laid one of her hands on her knee.

"Grandma, was it always an easy way and the way you wanted to go?" she asked Grandma smiled such a tender, loving smile down into the eager, childish face.

"Not always, dear," she softly answered. "But it was the Lord's way for me to walk, and looking back after many years, I see (although I have rebelled in spirit many times) how much the better was the way the Lord chose for me, and my heart is filled with thankfulness this New Year's eve."

"But, Grandma, when you want to do something, oh! so much, it's so hard to think it's best you shouldn't." And Nell's eyes brimmed over with tears, while her lips trembled. The dear old lady's face grew grave. Her heart ached for this little girl.

A gay riding party had been arranged for this New Year's eve, and Nell was one of its number. But, mamma, finding that among the party were two or three she did not wish her daughter to be intimate with had been obliged to withdraw her consent, and Nell, who never questioned mamma's decisions, nevertheless felt her disappointment hard to bear. Grandma knew it all and she drew the tear-stained, girlish face down on her lap, and let the sobs that were coming thick and fast, have their way, smoothing meanwhile the curly head with tender fingers.

The sobs grew less, and less, and at last Nell lifted her head, smiling at Grandma, even through her tears. She was a child in spite of her 17 years.

"I couldn't help it, Grandma dear. Somehow it all came at once, and I *did* want to go so badly."

Grandma stooped to kiss away one or two tear-drops lying on the rosy cheeks. Nell nestled closer to her. Grandma's way of comforting was so lovely, all her grandchildren said.

Footsteps sounded on the door stone outside. A moment later Grandpa looked in, holding the half-open door in his hand. "Alone, mother?" he asked in his cheery voice, "Oh: no, I see our little girl is here." Grandma, and Nell helped Grandpa off with his great coat and hat, and Nell drew his arm-chair close up by Grandma's low rocker. She knew they liked it that way, and kneeling, untied his shoes, for Grandpa's hands were chilled, Grandma said, holding one in both of hers.

"Only a little" he answered smiling. "But it is going to be a frosty night."

"Thank you, little daughter" he said, as Nell having finished her task, rose to her feet.

"She is such a comfort, our little girl," he added to Grandma.

Nell went back to her seat by the window. Was she a comfort? She didn't feel that she was at all; she was only a great, disappointed girl, who wanted to have a lovely time sleigh-riding with the rest,—and couldn't. She glanced over at Grandpa and Grandma. Their faces were so peaceful. Would hers

ever look like that? She was quite certain it didn't look that way now.

A door opened and steps came into the next room. She knew it was mother, for she heard baby fretting in a sleepy way, and the low, soothing mother-voice hushing him as she laid him in his cradle. Not her own mother—she had gone to the better land many years ago, and this one had come to Nell when she was an unreasonable little girl of twelve years, —a wise loving woman, whom Nell reverenced and dearly loved. Two little boys had followed mother into the room. Nell could hear their mingled voices clamoring for many things, after the manner of children, and baby kept up his fretful cry.

"Those dreadful boys! If they would only go out baby would go to sleep," Nell said to herself. Must she go out there? It was so peaceful in here.

She looked over at Grandma. The dear old lady was looking anxiously at her. Grandpa's eyes were on the floor. He was lost in thought, but she seemed to hear his tones again, "She is such a comfort, our little girl." Nell slipped quietly out of the door, and the next moment Grandma heard her say, "Let me rock baby, mamma, you are tired, and the boys want you." She also heard the mother's "Thank you, dear," and then the tramp of many feet out of the room, and all was quiet save Nellie's voice in cradle lullaby to the little one.

Grandpa heard it; it roused him from his reverie, "Who is singing, mother?" he asked.

"Nellie," she softly answered—"to the baby."

"Oh? yes," he said "I think I must have been dreaming, her voice is so like her mother's" Grandma had noticed it too; old memories came back to them both, and they sat silent. A loud peal of the door bell made them both start. Nell heard it, too, and it roused even baby, just crossing the border into dreamland. Nellie settled him back on the pillow, singing softly the while. Mamma herself answered the bell, smiling pleasantly on the tall young fellow standing there, who eagerly asked was Nellie home. Mamma said she was. "Well: Mrs. Brown, Annie is going with Tom Wright over to Uncle Jo's. They are going to have a little company, to-night. We just heard of it, and I thought, perhaps, (hesitating a little, and stammering over his words,) Nellie would like to go with me, It's splendid sleighing, and not so very cold. May she go, Mrs Brown?"

No mother, much less this good stepmother, could have refused the request made in this frank boyish way, and he followed Mrs. Brown into the cosy sitting-room, where leaving him, she went to Nell who, waiting with glowing cheeks and sparkling eyes whispered softly (not to waken baby) "Oh! mamma; how good! I heard you say I might go."

It took but little time for Nell, with mother's help, to put herself in party trim. Then warmly wrapped from the cold, she was lifted into the sleigh, and tucked around with the robes. The two aged people, attracted by the sleigh bells, and voices outside, had gone to the window. Grandma's face wore a bright smile, but Grandpa looked perplexed.

"Where are they going, mother?" he said "this cold night, and it's almost dark, too."

"Oh: only for a little ride, dear, I suppose," the dear old lady answered, adding briskly, "they are young people, you know, not old folks like you and I."

"On, yes," said Grandpa, "I see. Well, let them go, but" with an anxious look after the retreating sleigh, "it seems to me its pretty dark for children to be out."

Grandma did not answer. She went concontentedly back to her rocking-chair. Grandpa soon followed, and the two old people sat together in the double twilight, that of their lives, and that of *the New Year's eve.*

A FARMER'S SISTER.

WHAT THE GRANGERS DID TO HELP AN AGRICULTURAL COUNTY FAIR.

A GREAT deal of uncertainty was felt and evinced by the President and managers of the Chautauqua Co., Agricultural Society during the latter part of the summer of '88 in regard to the financial outlook for the coming fair at Jamestown. In the first place, the nature of the grounds was such that nothing like "racing", or even a trial of horse speed could take place. Marvin Park, although furnished with some of the best buildings in the State for an agricultural exposition, with its Floral, Mechanic, Dairy and Poultry Halls, and its half mile or more of sheds for the accomdation of stock, is adjacent to the outlet of Chautauqua Lake, and, within the memory of many who are not the "oldest inhabitants", it was a vast swamp. This piece of land has been so far reclaimed as to make it admirably adapted for all the uses of an agricultural fair, except the very questionable one of horse trots," which the loose and spongy nature of the soil forbids. It is thought that probably the whole tract is underlaid with water at no great depth, as fast driving causes the ground to shake and vibrate for a great distance around the vehicle. This consideration, together with the fact that the fair which was held the first week in September would lap on to the International Exposition at Buffalo—only 70 miles distant—which would probably draw a great many of the fine cattle and horses for which Chautauqua Co. is noted, caused apprehension in the minds of the officers of society,

Chautauqua Co. is one of the strongholds of the Grange, there being 17 thriving organizations within its limits, numbering thousands of members. The President, Vice-President and several of the directors are members of Union Grange No. 244, which has its place of meeting in Jamestown, and is nearly 400 strong, being the largest grange in the State. The question was several times asked at its sessions, "What can the granges—what can Union Grange do for the fair?" It was finally decided that the Agricultural Society should offer three prizes, of $50, $30, and 20, for the three best exhibits on wheels made by granges in the county. From this competition, however, Union Grange was to be excluded on account of its superiority in numbers and its proximity, which would render the contest unequal should it be allowed to compete. Again arose the question, "What can Union Grange do individually to help the fair?"

At last a lucky thought entered the head of one, which, on being voiced, found ready acceptance with the majority, to the effect that the Grange should make a free exhibition of whatever its members might choose to bring of the products of field, garden, orchard and home. The inner angle of Mechanic's Hall was the place chosen for the exhibit of Union Grange. A space about 10 feet in width was partitioned off from the hall by upright posts on which were hung and festooned elegant draperies with wreathings of various grains tastefully arranged, for, as one expressed it, "Evergreens which are so generally used for decorations are the free gift of the Creator and are common to every one who may choose to gather them, but fruit, grain and flowers come by labor and are the emblems of our industry," so these three products were chiefly used as being most appropriate. On the cut-off corner of the outer angle between the draperies was suspended a round shield, three feet in diameter, covered with wheat heads sewn flat on its face, with the words "Union Grange" in large letters arranged in the form of the segment of a larger circle made of everlasting flowers, and below this "No. 244." Around the shield was a fringe of oat heads, adding grace and beauty. The walls in the rear were covered with mahogany-colored cloth, forming a charming back-ground for the display of pictures and household work. On one side of the angle was a miniature representation of Chautauqua Lake, on a table 10 feet in length, with Lakewood, or the Saratoga of Chautauqua, in the back-ground. The shores of the lake were formed of sand and pebbles covered with moss, while in front ran, at short intervals, a miniature train of cars loaded with produce, representing the C. L. Railway. The cars passed behind a screen at the back, and at either end of the table was a huge pyramid which was turned by the same power which propelled the train. One pyramid was covered with flowers and the other with fruit both fresh and canned. Back of this table, in letters 22 inches long, was the word "Fraternity," the motto of the grangers, made by stringing kernels of corn on wire. This involved a great deal of work, but the effect was unique and altogether in keeping. Then there were fine oil paintings and crayons executed by the farmers' daughters which vied with anything seen in Floral Hall furnished by the city ladies, and specimens of needle work, silk patchwork, crochet, tidies, etc., such as fair-going people are familiar with, all the very best and finest which the wives and daughters in so many happy homes could produce. A beautiful floral shaft which might well have been the pride of a professional florist was the admiration of all beholders. Quadrangular in shape, it gracefully rose from the pedestal some two feet or more, tapering gently and ending in a point at the top. Two of the sides were covered closely with white flowers, with letters in scarlet geraniums making the words "Faith," "Hope," while the other two sides, which were covered with green, bore the words "Charity," "Fraternity" in white. On the opposite side of the hall were specimen products of the garden, field and orchard. The city papers and no doubt most of their readers pronounced this exhibit of Union Grange, which was made without any entries for premiums and without cost to the Agricultural Society, the most attractive display ever seen at a Chautauqua County fair. The third day of the fair came the "Grange wagons", five in number, from as many different granges, tastefully decorated and loaded with samples of everything fine to the taste, and pleasant to the eye, which the Creator grants to reward the faithful labors of the husbandman. These were displayed in the most advantageous manner according to the various tastes of those who had a hand in their construction. Each wagon carried also many articles of skill and taste fashioned by the ready fingers of the wives and daughters who lent their aid, fabrics which a half century ago would have been the marvel of an artisan. The advent of the "grangers", had been well advertised, and consequently the crowd which came to witness this new feature at an agricultural fair was immense, the gate fees were increased accordingly, the fair was a financial success, and the officers were made happy.

CHAUTAUQUA.

GOLDEN GRAINS.

How true it is no spoken words can give
Form to the best of thoughts which in us live!
—*Samuel Burnham.*

DR. CLARKE says a blind or deaf man has infinitely more reason to deny the being, or the possibility of the being, of light or sounds, than an atheist can have to deny or doubt the existence of God.....

SIR WM. TEMPLE truly says that company are to be avoided that are good for nothing; those to be sought and frequented that excel in some quality or other.....

How important, then, that we have friends! How important that we have good and pure friends! An impure hand stains the soul on which it is laid. Many a character carries a blot through life which an hour's companionship left on it. Many a life-web is marred and spoiled by the threads which unworthy and defiling friendships weave into it through the years. But the friendship of the pure and noble purifies, ennobles, adorns, beautifies and exalts.....

OLIVER WENDELL HOMES describes old age in the following exquisite lines:

"Youth longs and manhood strives, but age remembers—
Sits by the raked-up ashes of the past;
Spreads its thin hands above the whitening embers
That warm its creeping life-blood till the last."

"THIS day our daily bread," says the Contributor, has in it the great lesson of taking only to-day's burden, instead of adding that of a day which may never come. We may and must look ahead and make such plans and provisions as are within our reach, but in all cases, without worry and fear or anxiety. He who feeds sparrows is sure not to overlook his children.....

THAT is not wise molding of childhood which aims at brilliancy rather than sterling worth. Character, pure, symmetrical and sincere; attainments, solid, practical and well in hand, these scale the rising hights of success, and shine out over the sometimes rough and sometims dark sea of life with an evenness and intensity that no mere outward show and glitter can rival.....

SIR ARTHUR HELPS says with respect to the kind of persons to be trusted, it may be observed that grave, proud men are very good confidants. Secrecy is very much a matter of habit; and it may be expected that those who have ever had to conduct any business in which secrecy was essential will acquire a habit of reserve for all occasions.....

To the country parsons whose lives are made miserable by the flood of doubt and uncertainty which is apparently sweeping over our country, the author of Robert Elsmere brings words of encouragement and consolation, and advises them to fear not; although the higher criticism will doubtless destroy much that they have learned to love. The historical and scientific method, when applied to Christianity, may prove much that they hold dear to be no more than a beautiful myth. But a God of wisdom and goodness yet remains. They can still believe in a Power not ourselves which makes for righteousness, and in a religion whose cornerstone is the Divine brotherhood of man.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"If all dainty fingers their duties might choose,
Who would wash up the dishes and polish the shoes."

1889!

"Gone with its hopes, its joys and its fears—
Gone with its griefs, its sorrows and tears—
One more link in the chain of years—
Another year has gone!"

A NEW YEAR! What has t in store for us? Will it be a year of joy and prosperity, or will it be a year of grief and disaster? These questions force themselves upon us as the old year goes out and the new one is about to dawn. The young and gay look forward to "New Year's" as a day of festivity, but to the older the memory of the past years is sure to bring sadness with it. How many of us who had a happy, unbroken home-circle last year, will find a vacant chair at the fireside, a loved voice stilled forever, an empty place in the heart that nothing can fill! And when the New Year comes, all the sadness of the dying year rushes over us afresh. But even in our sadness comes the thought that the dawn of each year brings us nearer that great New Year, when the cares of this life are ended.

What good resolutions we start out with! We say we will be more careful and more frugal in the year that is just opening; that we will keep a watch on our tongues and tempers; that we will do, oh! so many wonderful things in the year that is to come. But how long do we keep these resolutions? Not long, many of us, I fear. But we can, if we will. If we form a good resolution, let us keep up to it each day, and if we do this, we will find ourselves victors at the close of the year.

We all long to achieve some great, wonderful thing in life, and while waiting for the great thing to come, we neglect our every-day, common-place duties, because they are so common-place. But it is these very common-place, every-day things that build up the whole net-work of our lives. Do each duty, each task as it presents itself, and when Death calls he will not find us with hands filled with the threads of life, tangled and knotted, but will find us with our web woven to the best of our ability, ready to give the ends into some one's else hands.

Who will begin with this new year? Do not set yourself too many tasks, but pick out a few things that you know you ought to do and set to work at once. A good plan might be to make a little placard on which to write your new resolutions; frame it neatly and hang it on your wall where you will see it when you wake in the morning. This will remind you each day of the promise you made yourself when the year was young I mean to do this myself—who else will?

DORA HARVEY VROOMAN.

"Your day will come,
though it arrive but slowly;
There's cream in all life, set however lowly."

A KITCHEN TALK.

ANNIE L. JACK.

IT is a busy time for mince pies and plum puddings, for traditional good cheer seems to be a necessity with the young and gay crowd that form our circle. Christmas and New Year's Day are really the children's times for enjoyment and we older ones are to have our pleasure in seeing them happy. Given a large amount of bread crumbs and less suet a plum pudding is not at all indigestible, and even mince pies can be made with enough apples and fruit to render them harmless. And when one has plenty of home-grown fruit, and can make candy at one's own kitchen fire, it is a great pleasure to the little ones to "help."

The younger girls are just beginning to con the cook books that have been such a guide to the elders, and we watch them experiment with a sort of sadness amid our pleasure—the sadness of retrospection.

Meanwhile the kitchen fire burns brightly and everything betokens good cheer. The housewife's bugbear is waste, and it is quite an item to take care of the food that is prepared for this season. Mold and decay in various forms are likely to creep in, and we

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

have to be constantly on the lookout lest wilful waste bring woeful want later on.

I was thinking of the force of example as I sat mending the guidman's socks. A little waif that we took into our family some years ago, who took a pride in idling her time, now seems to enjoy the light tasks of housework thoroughly, and improves more than our own little girl of the same age in thought and attention to duties. Children of good, sound stock can be molded,and it is only where there is moral and physical unsoundness that there is a defiance of improvement in training.

Looking back upon my own family government I can see many mistakes that I have made, but it is useless to rehearse them. Experience is the best school for learners and it is very seldom one mother profits by another's blunders. Meanwhile in our kitchen the newly fledged cooks are busy and feel their responsibility, for to make good bread and puddings, to get up a simple dinner for the family well cooked and on time is work far more important than it seems. And most young girls like to do the important and changing work that entails some responsibility and requires thought and skill better than the routine of sweeping and dusting. And now and then we are surprised on seeing how well things turn out even at the hands of a novice. At any rate it is best to let the young things try to make our burdens lighter.

FLOWERS IN THE HOUSE.

EVERYBODY worthy of a home strives to make it pleasant and cheerful. This is necessary at all esasons of the year, but particularly so during the long, dreary winter evenings of the North. Nothing will aid this desirable work so cheaply and effectually as flowers. They are a constant yet everchanging source of pleasure, every day presenting new forms of loveliness. A little skill and knowledge are necessary for the management of house plants, and with these as with all other things success is necessary to enjoyment. I shall endeavor to give a few suggestions that, I hope, will make the road to success easy.

Those who have green-houses and gardens perhaps will not need my counsel. My hints are designed for amateurs, for the thousands who have not these helps; but who love flowers and cultivate a few in the house. Thousands of persons annually purchase vigorous plants from the green-house and are pained to see them gradually fade and perish. How this can be prevented and how the plants can be kept in health and vigor, is the question I wish to discuss. Plants, like ourselves, need air, light, warmth, food and drink. If these are furnished in proper quantities they will live and grow, barring accidents of course. Where good soil is used in potting plants they seldom need any special fertilizer. The best soil is found near old fence rows where sod has grown a long time; this mixed with sand is superior for potting purposes. In watering, to each gallon of soft water used add a tablespoonful of liquid ammonia. In winter the temperature of the water should be about blood heat. Do not water often, but do so thoroughly. Most plants wintered in rooms are injured by too much heat. For a genera collection a room should not be kept at more than 65 degrees Fah., during the day, and 45 to 50 at night. Give a little fresh air every day when the thermometer is above 35 in the shade. An effort should be made to give moisture to the atmosphere. This can be done by evaporating water. Light and air should be given freely and sunshine when it is available. Plants deprived of these grow sickly and colorless. Cold drafts should be avoided as much for plants as for their owners.

Cleanliness is of vital importance to plant life. Every possible precaution should be taken to secure them from dust, also to cleanse the leaves by sponging or spraying. Even here a little caution is necessary, for while smooth-leaved plants are benefited by spraying or sponging, the rough-leaved varieties, like Rex Begonia, should not have the leaves often moistened. All plants should be turned around every day to give each side the same amount of light. This prevents them from growing one-sided. A thorough fumigation with tobacco smoke should be given them once a week to destroy insects.

J. F. POWER.

GOSSIP, GASTRONOMICAL AND OTHERWISE.

THE great question of domestic help, the despair of so many establishments, seems at last about to meet with a happy solution. A plan is on foot for the establishment of training schools especially adapted to benefit foreign-born girls who come to this country, ignorant of American house-keeping. Everything pertaining to domestic service, from blacking a stove, and washing dishes, to mending fine laces will be taught. A diploma will be given to every girl who graduates, and those who take but a part of the course, will receive a certificate stating what they can do, and to what wages they are entitled.

Many American girls who wish to be educated it is hoped will avail themselves of this opportunity to become good mistresses of homes, even if they still retain their foolish prejudice against working in other people's homes. The school is being organized under the auspices of the Sunshine Mission, in the form of a joint stock company. A capital stock of from $50.000 to $75.000 is needed. Shares are to be put at $1. each to make it possible for many to lend a hand in the enterprise. This, I am sure will be welcome gossip to many over-tired housekeepers.

WHITE is again coming into demand for table linen. Plush and satin scarfs are to be discarded, and napery itself must not only be white, but plain and fine as my lady's kerchief, and hemstitched in like manner. Table floral decorations are to be a matter of taste. Handsome china dishes in three compartments are used for wafers, butter and cheese, to be passed with salads, and also for jellies, olives and like relishes. A sensible article of dining-room furniture, known as the "dinner wagon" in England, and "etagère" in France, has been brought into use here. It consists of a set of open shelves holding extra silver, napkins, the salad bowl, jelly, and dessert dishes, and finger bowls. The large, heavy napkins used with the first courses should be replaced by smaller and finer ones with the Roman punch, or game or dessert, or a new one with each of the lighter courses.

A NEW YORK lady has established a new industry, if it may so be called. She is a lady, too, by the way, lacking only the wealth recently lost to make her sought after for other qualities than those which she now exercises. She attends to the marketing for a number of wealthy families; going to each house each day immediately after breakfast she ascertains by an inspection of the larders what will be the necessary supplies for the next three meals, receiving suggestions from the mistress in regard to certain wished for viands, or relying entirely upon her own judgment in the matter. She more than saves her salary in the greater economy employed in making purchases, on which she has in addition a percentage from the "butcher, baker and candle-stick maker." Generally in these establishments the cooks are competent to follow her suggestions regarding certain made dishes and entrees to be made from the "left-overs," which also greatly diminishes the waste and extravagance. PALMETTO.

THE LONDON QUEEN thinks that to be really a good neighbor demands the possession of many excellent qualities—tact, temper, discernment, and consideration for other people's feelings: Anent intimacy, it thinks it is necessary to exercise a little tact and to try to find out when one's neighbors have most leisure and at what hours they like best to receive visitors; there are, it thinks, very few neighbors, even if intimate friends, whom one cares to see every day; their society is apt to pall if one sees them too often. In fact, friendship with near neighbors, however nice and charming they may be, is best sustained by not too constant intercouse; there are very few people we can see daily and do not tire of; one does not meet more than one or two in a life-time.

WINTER SOUPS.

I OFTEN envy farmers' wives who can go to their root cellars, and from their abundant stores draw material for many delightful and different soups, whereas we unfortunate dwellers in cities and towns must buy all these little items, not perhaps at a great cost of anything except memory.

In my own family I have found a steaming hot vegetable soup both an appetizing and economical thing to begin a dinner with on a cold day. Even when I have to buy the milk and vegetables, the cost never exceeds from five to 10 cents for a sufficient quantity for six persons. Cream of celery is our favorite and would be somewhat extravagant, if I had not learned a new wrinkle in buying the celery. Every Monday I ask my butcher for three bunches of soup celery. For these I pay from 10 to 15 cents. This is merely the celery left from Saturday which has become wilted and is no longer salable. An hour in a pan of cold water restores it to its pristine freshness. The tops are then cut up for the fowls,and the roots are trimmed and laid in a pan of cold water with the outside pieces which are to be used for soups, sauces and stews. The roots are good for flavoring soups made with bones and meat which require long boiling. The crisp, white inner stalks are reserved for the table.

The RURAL has, I think, given directions for celery soup, but my recipe may be slightly different. Chop first a pint bowlful of celery with one small onion; cover with one quart of boiling water and if you have a rind or bone of bacon, or salt pork, add that also; boil for one to two hours until the celery is very tender; rub through a sieve with a potato masher and return to the fire with one pint of boiling milk, season with salt, pepper and a dash of Cayenne; add a tablespoonful of butter cut in bits, and rolled in the same quantity of flour, and one tablespoonful of finely chopped parsley. Give one boil and serve.

Carrot soup. Scrape and slice a pint bowlful of carrots, and boil until very soft in a quart and a pint of water. Put a tablespoonful of butter in the saucepan, and when melted, stir in a heaping tablespoonful of flour; mix smoothly, add the carrot purée, salt, pepper, and one cupful of hot milk. This is a cheap and pretty soup. A slice of bacon boiled with the carrot adds a nice flavor.

Onion Soup. Fry the above quantity of sliced onions in a little hot dripping until turning yellow; dredge with two level tablespoonfuls of flour; add a quart of boiling water and simmer for one hour: mash through a sieve; add a pint of boiling water, and a few bits of butter, and put three dozen croutons in the dish. Any of these soups may be varied, or improved—if you call it an improvement—by the addition of yesterday's, chop, steak, or veal bones, but they are very excellent without. A few slices of bologna sausage, and a grated carrot added to a split pea or bean soup, after it has been strained, and allowed to simmer for half an hour, make a pleasant addition.

Cauliflower soup made like the cream of celery, with some cauliflower left from dinner, is very nice. Potato soup should have a quarter of a pound of salt pork to two quarts of soup.

Mock bisque made with tomatoes you are all familiar with, but if you have a pint of pea or bean soup left you can entirely change its character for the next day's dinner by adding half a can of tomatoes and a cup of water; simmer all together for half an hour, thicken with a teaspoonful of flour wet with cold water, season, strain and serve.

An excellent combination soup is made from every kind of raw vegetables chopped together. If they are minced very fine they need not be strained. A handful of soup beans boiled with them gives the soup quite a different flavor.

A most delightful soup is made from two cups of cold baked beans, a pint of canned tomatoes and a quart of water. Simmer half an hour; mash through a sieve and thicken with a little flour and water.

AUNT ALICE.

is the finest lamp in the world. It gives a **pure, soft, brilliant white** light of **85** candle power,—a *marvelous light from ordinary kerosene oil!*

Seeing is Believing

A "wonderful lamp" it is indeed. Never needs trimming, never smokes nor breaks chimneys, never "smells of the oil;" no gumming up, no leaks, no sputtering, no climbing of the flame, no annoyance of any kind, and **cannot explode.** And besides all these advantages it gives a *clear, white light,* **10 to 20** times the size and brilliancy of *any ordinary house lamp!* Finished in either Brass, Nickel, Gold or Antique Bronze.

Send postal card for illustrated price list. Single lamps at *wholesale price,* carefully boxed and sent by express. Get our prices "*Seeing is believing.*" Address **GLADSTONE LAMP CO., 10 East 14th St., New York.**

METAL AND Wood Workers' **TOOLS**
FOOT POWER SCROLL SAWS, MORTISERS, LATHES, FORMERS, CIRCULAR SAWS, **MACHINERY**
We carry in Stock all the **LEADING** Foot Power Machines. AND MAKE **VERY LOW PRICES!**
Send stamps for large Illus. Catalog
JOHN WILKINSON CO., 55 State Street, CHICAGO.

WONDERFUL RESULTS obtained with Perfection Fast Dyes for Cotton. Turkey Red, Blue, Yellow, Scarlet, Cardinal, Wine and Brown. Package by mail, 10c.; ½ doz. samples, 40c. Agents wanted.
W. CUSHING & CO., Foxcroft, Me.

BRIGHT, ACTIVE AGENTS WANTED to sell the Rich Book
"DELIGHTFUL STORIES"
Or Home Talks out of the Wonderful Book.
This work contains 100 Delightful Naratives of the most wonderful occurrences in the Sacred Volume, very attractively illustrated. Success of agents is **astonishing.** One lady has sold nearly 3,000 copies alone. **Low Price. Big Terms** to Agents. Apply to **HUBBARD BROS.,** Philadelphia and Chicago.

News of the Week.

HOME NEWS.

SATURDAY, December 29, 1888.

THE police will not permit Anarchist Lucy Parsons to lecture in Chicago. Many say she ought to be allowed to speak and be punished for any criminal language she might use..... All reports about the recall of Minister Phelps from England are said to be unfounded .. ....On December 23, the steamboat Kate Adams, one of the finest and swiftest boats on the Mississippi, was burned near Commerce, Mississippi, about 40 miles below Memphis, Tenn. She had about 200 persons on board of whom 80 belonged to the crew. All those in the cabin escaped, but 50 of the deck hands and passengers perished. The officers and crew behaved bravely and saved many lives..... ...Pawnee Bill is the new leader of the Oklahoma boomers who are said to number from 10,000 to 14,000 in Southwestern Kansas and Western Arkansas. Wichita is at present the headquarters. Some want to march at once; but it appears to be the opinion of the majority that they ought to wait for the result of the Oklahoma bill now before Congress. Should this be unfavorable they will start at once, "using arms only for self-protection."..... .... Christmas Day the steamboat John H. Hanna was burned on the Mississippi near Plaquemines, La., and over 30 of the passengers and crew were burned to death or drowned. The pilot, Jim Givens, acted as heroically as Jim Bludso, keeping the vessel's nose to the bank though his eyes were burned in their sockets and his ribs laid bare by the flames. The hero died in great agony a few hours later ..... On Christmas day 37 of the principal building in Marblehead, Mass, were cremated, including several factories. Indeed, most of the town was burned. Nearly 1,500 persons have been thrown out of employment. Distress is great and pressing and public charity is earnestly solicited..... ..The most startling train robbery in years is that of the Central Pacific the other day near Clipper Gap, in the Sierras. The booty is said to be as high as $50,000 .....A 14-year-old boy, named Gleck, broke the lock on a powder and dynamite magazine at Mount Pleasant, 17 miles from Wheeling, W. Va., on December 23, and with two other youngsters entered the building smoking. There were 210 kegs of powder, and 10 cases of dynamite. All went off, blowing Gleck into atoms and severely injuring his two companions, who had run away before the explosion. Seventeen men were badly injured and nearly every house within a mile was badly wrecked. It felt like an earthquake away in Wheeling.....Hermansville, in the Upper Peninsula of Michigan, has been wiped out by fire. Loss, $250,000..... It is estimated that there are 2,500 women in the United States who hold diplomas from medical colleges, either American or foreign.. .....There is a decided movement in West Virginia in favor of changing the name of that State. Its promoters say that every State should have a distinct name of its own, so far removed from the name of any other State that no confusion of names can arise. West Virginia is so nearly like Virginia that the people do not enjoy it. Curiously enough, they all agree that "Kanawha" is the name for the State.....Dr. James Scott, author of the famous Scott liquor laws, died the other day at Columbus, Ohio, aged 73 ..... The dead body of the second daughter of Hawes, the Birmingham, Ala., murderer, was found over a week ago in the lake where her sister's was discovered. He is now held for the murder of his wife and two daughters. No more rioting.....Axworthy, Cleveland's defaulting treasurer, has settled by paying down $160,000 and making over to his creditors all his American property..... The Indiana Legislature will have to borrow $2,000,000 for the running expenses of the State for the next two years.... The Texas Capitol, built by Chicago men for three million acres of land, valued at $1 per acre, has been turned over to the State and accepted..... Samuel J Tilden's will which left about $4,000,000 for founding a great public library in this city, and which has been contested by his nephew, has been sustaind by the Supreme Court. It will now be taken to the Court of Appeals—the Court of final arbitrament..... Governor Hill has ordered an extraordinary session of the Court of Oyer and Terminer for the trial of the New York "boodle" Aldermen ..... During November 25,419 immigrants arrived at the several ports of the United States.....Judging from the number of steamboat and railroad accidents, deaths by drowning, murders and stabbing cases reported during the last few days, the correctness of the old saw about a "green" Christmas fattening the churchyards has been partially established..... Illinois, following the example of Ohio, Indiana and New Hampshire, passed a law last year forbidding the marriage of first cousins; but its passage was overlooked until the other day, and many illegal marriages of the kind have been contracted since it was to go into force..... ....Governor Hill has just appointed George B. McClellan, son of Little Mac, an aid on his staff. This makes young McClellan a Colonel at a jump. He is one of the Wall street reporters for the New York Herald..... The body of Gen. Logan was removed from its temporary resting place at Washington, Wednesday to the mortuary chapel erected by Mrs. Logan at the Soldiers' Home..... Attorney-General Garland has decided to locate permanently in Washington, where he will open a law office after the 4th of March. ..... James Matthews, editor and proprietor of the Buffalo, (N. Y.) Express, died Dec. 20, aged 60.....Oliver Ditson, the well known music publisher, died at Boston, December 21, aged 77..... Indian scouts under Lieut. McComb have driven all the settlers "like so many hogs" from Oklahoma Station. Many prisoners have been made.....A severe storm prevailed in Iowa, Wisconsin and Northern Illinois, Wednesday and Thursday. Over a foot of snow fell..... Last week a terrible blizzard swept over the Province of Quebec, Canada, causing heavy pecuniary losses, a vast amount of suffering and several deaths.....The Prohibitionists cast a total popular vote in the Presidential election of 257,243. This is to be compared with the 151,808 votes for St. John in 1884; 10,305 in 1880, and 9,522 in 1876.....The South Carolina Legislature, just before its recent adjournment, reduced Confederate pensions from $50 to $30 a year..... There has been "a war of races" at Wahalak, Miss. where one white has been killed and several wounded. As the negroes retired to the woods and swamps and the pursuing whites swore terrible vengeance, it is not known how many colored persons were killed and wounded. At a riot at Lamar, Miss. two whites and five negroes were killed. There has also been a good deal of rioting between whites and blacks at Wilmington, Del. and several other places, but no deaths are recorded. In all cases of negro rioting in the South numerous armed white volunteers flock to the scene from all the surrounding country; for all feel that negro turbulence must be promptly suppressed at any cost..... The little propeller Leif Ericksen, with 33 persons on board, plying between Seattle and Sidney, W. T., was burned Monday when off Alkali Point, and five certainly, and possible seven lives were lost..... ..... Chicago packers are again denouncing the freight rates on Western railroads to go into effect on Jan. 1. They say rates on live hogs are higher than on packing-house products from Kansas City and Omaha to Chicago, thereby giving the packers at Mississippi river points an advantage over Chicago packers.....Mayor Hewitt, of this city, says his expenses in his late unsuccessful attempt to secure a re-election were $40,000.....

With Apologies to Pope.

"Then know thyself, presume not God to scan
The proper study of mankind is man."
Place the deft touch upon the pulsing wrist,
Or at the breast unto its throbbings list."
Note thou the crimson tide in ebb and flow,
Now quick in heat and now in languor slow.
See vigor more with its impatient stride,
Or being faint, as swells or sinks its tide.
Consider then, the air we breathe is rife
Will ill or ailment of throbbing life,
With food or poison charged, to turn the blood
A bounteous flow or an infectious flood.
But bland and mollient to the sharp distress,
Is nature's breath in magnetized excess,
All purient clog and obstacle to purge,
With blessings come—with weaknesses emerge.
Sweet, transient guest, the lungs one moment hold
To bring a glow depart with choking cold.
To urge new vigor thrill with rare content,
Gracious, restoring, curing ailment
Revive the weak with animation warm,
Treatment by inhalation acts a charm.

Witness the following:

FORT WORTH, TEXAS, Nov. 2, 1885.
"I regard your treatment by inhalation as a wonderful discovery of science."
REV. A. A. JOHNSON,
Pres. Wesleyan College.

SYRACUSE, N. Y., June 13, 1888.
"Compound Oxygen did so much for me."
F. C. JOSLYN.

UTICA, Miss., July 18, 1888.
"I most cordially recommend your Home Treatment." MRS. THOS. H. LEWIS.

JAMESTOWN, N. Y., June 30, 1888.
"Compound Oxygen has benefited me."
No. 33 Main St. WM. H. PROUDFIT.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, December 29, 1888.

After all, it looks very much is if De Lesseps's grand project, the Panama Canal, had collapsed, so that the "Big Ditch" is likely never to be dug or at any rate not by those who have already buried so much money in it. The originial stock of the company was $60,000,000 in shares of $100 each or thereabouts in French money, the face value being 500 francs per share. De Lesseps promised that the work should be done for between $125 000 000 and $170,000,000 and that the canal should be opened on Jan. 1. 1889. The funded debt now amounts to $350,000,000 and the outstanding obligations to $50,000,000 more, and not much more than one-third of the work is completed, while the engineers can't furnish even proximate estimates of the sum required to finish it. There are 800,000 shareholders, most of them poor French people—chiefly economical artisans and farmers, who, remembering the brilliant success of the Suez Canal, and deceived by the alluring talles of De Lesseps and his coadjutors, time after time entrusted then savings for investment in the ditch. Moreover, they were tempted by large interest on their money from the very first, though it wasn't earning a cent, the interest being taken out of the capital. Probably the investors will lose every cent. Not long ago the shares sold at a premium—at over 500 francs each—now they are going down at 117 francs. After failing in various other schemes for raising money, DeLesseps, some months ago, after much pleading and threatening, obtained permission from the French Government to issue 400,000 fresh Panama bonds in the shape of a lottery loan. A little over a fortnight ago it was found that only a little over 180,000 of the bonds could be put off on the public, and as it was agreed that the money should be refunded unless all were taken, this has been done. Efforts have been made and are still being made to induce the Government to guarantee interest on the loan as the only means of floating it, but it is hardly likely to do this. It is already too much involved in the matter, and a guarantee of a loan would involve the ultimate completion of the project by the Government at a ruinous cost, in defiance of the unequivocal assurance it gave our Government in 1880 that it would continue a purely private business. It is very unlikely that our Government would permit a canal across the Isthmus to fall under the control of any European Government contrary to the "Monroe Doctrine" and with much danger to our commercial and national safety and welfare. Efforts are being made in France to find some expedient for continuing the work to the end, but none has hitherto been discovered. About 2,000 workmen have been discharged, but about 9,000 are still plodding along. Boulanger has availed himself of the Panama collapse to seek fresh adherents among the discontented elements of all kinds. He writes a letter sympathizing with De Lesseps and blaming the Government. A meeting of 4,000 Panama share-holders in Paris adopt the same policy. In fact, all the stockholders who have spoken do the same. Boulanger's popularity is growing. Although already a Deputy, he will contest the seat for Paris made vacant by the late occupant. Gen. Montauban, a man of great influence in civil and military life, has come out solidly in his favor, and how to defeat his party at the next elections is sadly puzzling the Government.

Deserving of Confidence.—There is no article which so richly deserves the entire confidence of the community as BROWN'S BRONCHIAL TROCHES. Those suffering from Asthmatic and Bronchial Diseases, Coughs, and Colds should try them. They are universally considered superior to all other articles used for similar purposes. The late Rev. Henry Ward Beecher said of them: "I have never changed my mind respecting them from the first, except I think yet better of that which I began by thinking well of. I have also commended them to friends, and they have proved extremely servicable."—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, December, 29, 1888.

OVER 2,362,500 pounds of butter have been made during the year in the 63 creameries in Connecticut, bringing in a revenue of about $600,000.... ...There are 2,800 members of the Michigan Anti-Horse-thief Society, and during the past year they have not had a cent's worth of property stolen..... The International Exhibition of horses, asses, etc., to be held in Paris in 1889, has been fixed definitely for the 1st to the 10th of September. The prizes have been largely increased, and the highest for the best horse in the exhibition will be 10,000 francs.....The Nebraska State Beekeepers' Association will meet at Lincoln, January 9, 10 and 11.....The Ontario Beekeepers' Association will meet at Owen Sound, Ont., January 8 and 9..... It is said that Mr. J. B. Haggin, the California millionaire and sportsman, has paid $50,000 for the Kentucky three-year-old gelding, Proctor Knott, which so highly distinguished himself on the race-course during the past year.... .....The Twenty-Second Annual Meeting of the Minnesota State Horticultural Society, in joint session with the Minnesota State Amber Cane Association, is to be held at Market Hall, Minneapolis, Minn., Tuesday, Wednesday, Thursday and Friday, January 15, 16, 17, and 18, 1889..... The Vermont Legislature has granted $1,000 to the Vermont Dairymen's Association, and appointed a commission to study the whole dairy subject of the State..... John E. Wood, proprieter of the Knickerbocker Stock Farm, near Middleton, N Y., died the other day of pneumonia, aged 62. It was he who founded the Knickerbocker Ice Company when he was a young man.....Just before Christmas, Smith's Falls, Ont., Canada, shipped 200 tons of dressed poultry to the Boston market in 20 refrigerator cars over the Canadian Pacific R. R. They were entered at the Custom House as worth $45,000.. .....Farmers in various parts of the country are beginning the cultivation of the indigo plant, which forms a very important feature of Chinese agriculture. The indigo fern is one of the seed-pod varieties of plants, with a stock and leaf not unlike the fish geranium, but of darker green in color. It is very hardy, easily cultivated, and unlike many of our native products, is never attacked by insects..... Professors H. E. Stockbridge and William P. Brooks have arrived here from Japan, where they have for some years been connected with agricultural teaching. The former is at once to become Director of the Indiana Agricultural Experiment Station, and the latter to become Professor of Agriculture in the Massachusetts Agricultural College, of which both are graduates .....At the meeting of the Mass. State Grange, at Westboro last week, Henry A. Barton Jr., of Dalton, was unanimiously elected Master to fill the unexpired term of Arthur A. Brigham. He is 37, the sixth Master, and an extensive dairy and fruit farmer.....

WIRE NETTING FENCES.

THIS style of fencing has been in use for many years in a limited way, but in the last five or six years thoulands of miles of it has been put up. It has proved to be the best fence for all purposes that has yet been tried. Sedgwick Bros., of Richmond. Ind., are large manufacturers of these excellent fences, and will send catalogues to all applicants. The RURAL NEW-YORKER takes pleasure in inviting its readers to write to them, referring to this paper.—*Adv.*

Literary.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

"AN you said 'e 'ad a futer did you Bill?" "I did that, mum, which I'll leave it to Parson, mum." Thus appealed to, the Rev. Mr. Grayling testified to the truth of Mr. McKelvey's statement.

"So 'e 'ave Bill, so 'e 'ave"—was Mrs. Mc Kelvey's consoling remark.

I hardly think it wise to attempt to disprove any of Mr. McKelvey's claims in regard to the "futur" of his son and heir. As the young man was some thirty years the junior of Mr. Gray, that cynic would be obliged to reach a very ripe old age in order to enjoy more "futur."

Mr. McKelvey went at his work with the air of a man who had still plenty of fight left in him. He drowned imaginary Jack Grays in the hot dish-water and rubbed the lie out of him with his towel time and again.

The "fool" had been so much interested in this discussion that he had not noticed the visitor who came in with Mrs. McKelvey. It was only when he walked up to the stove after the question had been decided, that he noticed a little girl sitting by the cradle. He started at the sight of her. It seemed to him that he had never seen such a pretty little thing before.

The hair, bright as gold, fell in a tangle down over her neck and face. Her great blue eyes were wide with wonder at the strange things before her. The little ragged dress could not conceal the beautiful little form. The minister sat down by the stove to watch her.

Where had he seen those great eyes before? Had they not looked in at him through that window upstairs? The yellow curl in his pocket seemed to give a great throb as he thought of it; but he fought the feeling down. It was not often that he noticed children, but this one seemed to fascinate him in some way. "Come hither, little one"—he said at last beckoning to the child. She came and stood by the stove and looked wonderingly up in his face.

"What is your name?" he asked, stroking the mass of curls back from her eyes. The little thing did not seem to understand him. She only opened her eyes wider than ever at the question. How like the others they were!

"What is your mamma's name then?" asked the minister. "Sarcy Sall"—answered the little girl, as her eyes fell.

"Ye musn't talk about her mother, Parson," broke in Mrs. McKelvey hastily—"she hain't a good woman, Parson, an 'it hain't fer such as ye ter talk h' about 'er. Come 'ere, Mamie"—she added with a strange tenderness—"come 'ere and git yer supper." She had formed a high chair by placing a little cricket upon one of the common chairs, then she brought out from the pantry, for her visitor, a small, gaily-painted plate and a tiny cup, which had been bought for her own little girl who now lay in a grave under the snow.

The child ran away from the Parson at Mrs. McKelvey's invitation and the good landlady lifted her to the top of the high cricket. Mamie held up her little mouth to be kissed, and then began her supper, with Mr. McKelvey to do the honors in his best style.

Mrs. McKelvey's eyes glistened as she came over to whisper an explantion to the Rev. Mr. Grayling. "'Er mother is dying, sir. She 'ave been a h'awful bad woman, but she can't live much longer an' I won't see 'er starve sir—no matter what folks dooes say"—and Mrs. McKelvy bristled defiantly.

I doubt not that if Drum Lake had defended Sarcy Sal, Mrs. McKelvey would have been her most bitter assailant, but as Drum Lake society had long since closed its doors against the aforesaid person, Mrs. McKelvey was her only champion.

"Who wouldn't take care of such a dear little creter, bless 'er dear little 'art?" and even brave strong-minded Mrs. McKelvey wiped her eyes on her apron, thinking no doubt of the other little girl who used to sit in the same place years ago.

But crying will not prepare breakfast for hungry boarders, and such memories will never wash dishes. So Mrs. McKelvey seemed to think, for, after blowing her nose in a most suspicious manner, she went at her work with an energy that made it fairly tremble in its boots.

The "fool" sat and watched the group around the table. You or I would have been satisfied ter watch Mrs. McKelvey. But the minister hardly noticed her even when she went to the pantry with a long row of cups under her chin forming a most dangerous angle down over her ample breast. He was watching the little girl.

Mr. Mc Kelvey was giving evidence of great powers of entertainment. He could make himself extremely agreeable to his guests if he chose, and already he and little Mamie were wonderful friends. He would wink at her in the most knowing way over the dish-pan, or play "bo-peep" behind a tin plate, till the little girl would throw back her head and laugh so merrily that Mrs. Mc Kelvey would come to the rescue with, "Now, Bill, 'ow you h'act."

But Mr. Mc Kelvey did not speak to his little friend, for he knew he would only frighten her if he did.

I wonder what made the "fool" do it. He promised himself to burn the ribbon and curl, but he was like other men after all. There is something about such things that begs us not to destroy them, even when we know it would be better to put them in the flames. Perhaps the Rev. Mr. Grayling thought it would be about the same to give the ribbon away as to burn it. Perhaps the little tangle of golden hair touched him. No matter what the motive was, he pulled the ribbon slowly out of his pocket, and walked over to the little girl.

"She ought to have her hair confined, let us try this band"—he said, holding out the faded token.

Mrs. Mc Kelvey hastily dried her hands, and tied the ribbon around the head of the smiling little girl. Then she stepped back to view her work. "H'aint it putty" she cried delighted "Where did 'e git it Parson?"

"I—I—have had it in my possession for—a—some time," stammered the "fool."

Mr. McKelvey came and lifted Mamie from her chair and carried her over to the looking-glass so that she could see herself. "'Mazin' putty, 'mazin' putty," he criticised in a hoarse whisper that was entirely new to the minister. It was his tone for conversation with children.

Mamie was wonderfully pleased with her present. She raised herself on her small toes when Mr. McKelvey put her down in the hope of obtaining another peep at herself. Mr. McKelvey, at the risk of prolonging his work till morning, came every two or three minutes to hold her up for another inspection.

At last Mrs. McKelvey decided that it was time for Mamie to go home. The little girl pouted a little at this announcement, but did not refuse when Mrs. McKelvey told her that her mother might need her. She went all around to say good-bye. She kissed Mr. McKelvey and pulled his beard and his nose in the most friendly manner, and kissed the baby just as heartily as if no insinuations had ever been cast upon his nose. When she came to Mrs. McKelvey that kind woman gathered her up in her arms, and rocked back and forth with her for a moment. "I love you," said the little girl, "and *you*, too,"—seeing the disappointed look on Mr. McKelvey's face—"and *him*," she added doubtingly, pointing to the minister.

"Bain't e goin ter kiss the Parson?'—asked Mrs. McKelvey, when her violent demonstrations of affection were over. Mamie walked bashfully up to the minister, and held her mouth up to him. He bent down to meet it, and she gave him a kiss that sent his blood tingling as it had not done for years.

Mrs. McKelvey stood at the kitchen window after Mamie went out, to see that the child reached her home in safety. She was satisfied at last to see the little girl run in at the door of a small house far down the street. Then she went back to her work with an extra energy to make up for lost time. While she is busy let us go in with Mamie for a moment.

The room that Mamie entered was very plain. A cooking stove at one side, a few chairs, a rough board table made up all the furniture. There was no light except for the moonbeams that came drifting in, at the window, and formed long patches of light on the floor.

"WHAT'S KILLING US."

THE WONDERS WHICH THE MICROSCOPE REVEALS.

ONE of the leading scientific publications states that many people are now using the microscope to discover the real cause of disease in the system, and to detect adulterations of food and medicines.

This wonderful instrument has saved many a life. A microscopial test shows, for instance, the presence of albumen, or the life of the blood, in certain derangements of the kidneys, but medicine does not tell us how far advanced the derangement is, or whether it shall prove fatal.

The microscope, however, gives us this knowledge:

Bright's disease, which so many people dread, was not fully known until the microscope revealed its charactertistics. It greatly aids the physician, skilled in its use, in determining how far disease has advanced, and gives a fuller idea of the true structure of the kidney.

A noted German scholar recently discovered that by the aid of the microscope, the physician can tell if there is a tumor forming in the system, and if certain appearances are seen in the fluids passed, it is proof positive that the tumor is to be a malignant one.

If any derangement of the kidneys is detected by the microscope, the physician looks for the development of almost any disease, the system is heir to, any indication of Bright's disease, which has no symptoms of its own, and cannot be fully recognized except by the microscope, he looks upon with alarm.

This disease has existed for more than 2,000 years. It is only until recently that the microscope has revealed to us its universal prevalence and fatal character. Persons who formerly died of what was called general debility, nervous, breakdown, dropsy, paralysis, heart-disease, rheumatism, apoplexy, etc., are now known to have really died of kidney disease, because, had there been no disorder of the kidneys, the chances are that the effects from which they died would never have existed.

As the world becomes better acquainted with the importance of the kidneys in the human economy by the aid of the microscope, there is greater alarm spread through the communities concerning it, and this accounts for the erroneous belief that it is on the increase.

As yet neither homeopathist nor allopathist is prepared with a cure for deranged kidneys, but the world has long since recognized, and many medical gentlemen also recognized and prescribe Warner's safe cure for these derangements, and admit that it is the only specific for the common and advanced forms of kidney disorders.

Formerly the true cause of death was discovered only after death. To-day the microscope shows us, in the water we pass, the dangerous condition of any organ in the body, thus enabling us to treat it promptly and escape premature death.

As the microscope in the hands of laymen has revealed many diseases that the medical men were not aware of, so that preparation, like many other discoveries in medicine and science, was found out by laymen, outside the medical code; consequently it comes very hard for medical men to indorse and prescribe it. Nevertheless, Warner's safe cure continues to grow in popularity and the evidences of its effectiveness are seen on every hand.

Some persons claim that the proprietors should give the medical profession the formula of this remedy, if it is such a "God send to humanity," and let the physicians and public judge whether or not it be so recognized.

We, however, do not blame them for not publishing the formula, even to get the recognition of the medical profession. The standing of the men who manufacture this great remedy is equal to that of the majority of physicians, and the reason that some doctors give for not adopting and prescribing it—viz: that they do not know what its ingredients are—is absurd.

Mr. Warner's statement—that many of the ingredients are expensive, and that the desire of the unscrupulous dealer or prescriber to realize a large profit from its manufacture by using cheap and injurious substances for those ingredients would jeopardize its quality and reputations; and that Warner's safe cure cannot be made in small quantities on account of the expensive apparatus necessary in compounding these ingredients—seems to us to be a reasonable and sufficient one.

The universal testimony of our friends and neighbors, and the indisputable evidence that it, and it alone, has complete mastery over all diseases of the kidneys, is sufficient explanation of its extraodinary reputation, and conclusive proof that it is, perhaps, the most beneficient discovery known to scientific medicine since the microscope revealed to us the all important nature of the organs it is designed to reach and benefit.

ENTERPRISE, DILIGENCE, RESEARCH.

ORIGINAL IN ALL ITS DEPARTMENTS.

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:
"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:
"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:
"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:
"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:
"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:
"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Joseph Harris, Moreton Farm, N. Y.:
"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined."

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

The Rural NewYorker,
34 Park Row, N. Y.

CATALOGUES, ETC., RECEIVED.

PURITY AND VITALITY OF SEEDS.—Bulletin No. 59 of the North Carolina E. S., has an article describing some tests made to determine the value of seeds sold in N. C. Here are a few of the conclusions reached by the Director of the station.

"Except in regard to the larger sorts of seeds, such as cotton, corn, peas, etc., the seeds of field crops are rarely sold entirely free from an admixture of weed seeds. Indeed, most of the weeds now so troublesome in our cultivated fields are European plants, which were originally introduced and widely disseminated in packages of imported seeds.

"While the entire exclusion of weed seeds from packages of clover, grass and small grain seed is not to be expected, the farmer is justified in demanding that the real worth of the seeds he purchases shall come up to a reasonable standard. A number of samples of grass and clover seeds recently tested at this Station fall so far below such a standard as to convey the impression that they have been adulterated, with fraudulent intent, by the seed growers.

"The seeds of no two species of plants are exactly alike in size and weight; and, since manufacturers now supply automatic cleaning machinery of very great perfection, there can be no excuse for putting upon the market such seed, for instance, as a sample of Red-top examined, which contained 37.50 per cent. of impurities; and of the pure seed only 53 per cent. were capable of sprouting; or, in other words, in the sample there were only 44.92 per cent. of pure, vital seed.

"Carelessness on the part of the grower, and a desire to furnish cheaper seeds than competitors, have much to do with the marketing of such impure and semi-worthless seed. The seedsmen are, however, not wholly to blame in this matter.

"So long as farmers and gardeners demand cheap seeds, regardless of quality, just so long will persons be found to cater to the demand, even though they are obliged to debase the quality to make up for the low price. Very cheap seeds should be always viewed with suspicion. They are usually the most expensive things that the farmer can buy."

It is stated in the bulletin that the following standard of purity and vitality of agricultural seeds has been established by the Royal Agricultural Society of England; English seedsmen are required to guarantee their seeds in accordance with this standard.

1. "That 95 per cent. by weight of the seeds shall be true seeds of the species claimed."

2. "That of the pure seed not less than 90 per cent. shall be capable of sprouting in the case of the clovers, the cereals and Timothy grass. Of Foxtail grass not less than 20 per cent., and of all other grasses not less than 70 per cent."

METHODS OF ANALYSIS OF COMMERCIAL FERTILIZERS, CATTLE FOODS, ETC., ETC.—Bulletin No. 19 of the Department of Agriculture is issued under the above title. It contains the report of the meeting of agricultural chemists held last August.

PEACH "YELLOWS."—This is to be the subject of a bulletin now being prepared by the U. S. Department of Agriculture. It is to certain 200 pages with 40 illustrations. All horticulturists who want it, should send their names to Commissioner Colman at Washington, D. C.

ALABAMA EXPERIMENT STATION.—Bulletin No. 2 is devoted to the record of some experiments with wheats. A list of the trees of Alabama is also given. Why do not some of our Southern stations do something about classifying varieties of cotton?

THE AMERICAN MAGAZINE.—This excellent magazine is published in this city. It ranks with the very best in quality while its price is below the others. Those who examine it will find an excellent chance to secure a set of the complete works of Charles Dickens.

POULTRY FOOD.—Canned goods have long been used in the family, but it is a new thing to put up canned meats for poultry. The Hollis Dressed Meat and Wool Co. 20 North Street, Boston, Mass., put up a good quality of fresh meat, carefully cooked, ground fine, seasoned, hermetically sealed in tin cans of convenient size. The meat is ground fine and can be readily mixed with soft food. It is sold at a reasonable price and is likely to have a very large sale among the better class of poultry raisers. Send for circulars, etc.

THE POST OFFICE CLUB.

OUR parrot has been putting in double time of late. The end of the year is always the time for settling matters. It is like a traveler on a strange journey pausing to get his bearings. Life is a journey. We are all moving on. Some are pushing bravely ahead, lending their best energies to the task of working out some settled purpose. Others are simply drifting with the tide. Some of the folks in our neighborhood seem to have fallen behind the tide a little, but still they move. The seasons change us. Each one brings something and takes something away. The record is never left even. About New Year's time we hear it all.

The parrot has been listening carefully. He took it all in. Last night he delivered his opinion.

He mounted the top of the stovepipe. It would be too hot for him there but for the fact that the thick layer of dust is a poor conductor of heat. We got the condensed opinion as follows:

"Farmin' don't pay!"

There were several men who were all ready to applaud this sentiment, but the minister got in ahead of them.

"Why, my very dear friend," he said, "you are surely misinformed. The power for good that lies in agriculture is simply unbounded. The farmer feeds the world. Civilization dates from the farm. The farmer stands as the great balance wheel in public affairs—the conservator of morality, sobriety and order."

The parrot listened attentively to this eloquent outburst. He put his head on one side and croaked,

"Farmin' don't pay!"

"Don't pay, eh?" said John Cheeseton, "That's where you make a fool of yourself. I make it pay. I keep a dairy herd. My wife makes the best butter in this country and I can sell every pound of it at 30 cents a pound, summer and winter. I have paid my mortgage and made a good start. I use the best cows and the best tools I can get."

The parrot did not seem to feel insulted at all. He merely scratched his beak with his claw and croaked,

"Farmin' don't pay!"

"Of course it don't pay as *you* farm" said Job Go-ahead. "You sit here and croak and mutter over this stove till your muscles all get tired. What business *ever* pays till you get out and push it. You are like a man stuck in the mud. He stays on the seat and groans. He won't get out till he puts his shoulder to the wheel and pushes the wagon out of the old rut. "Farmin' don't pay?"

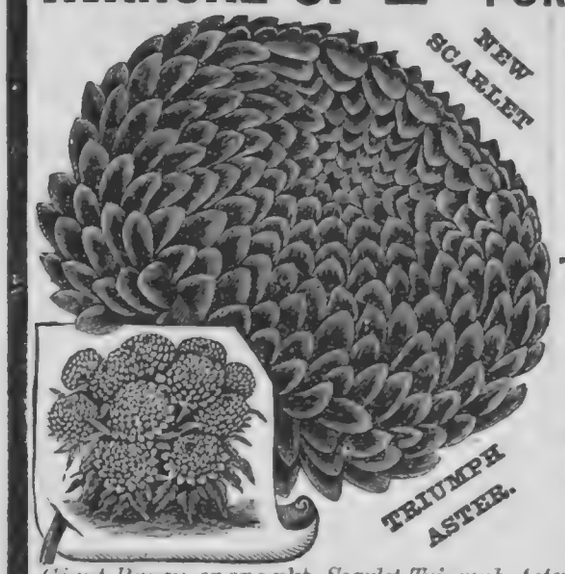
"No, and it never will as *you* do it. You keep on croaking and scratching yourself. You can't scare anybody that has got good sense." And the parrot could only say—

"Farmin' don't pay!"

SMALL PICA.

Trees, Seeds and Plants.

OUR MANUAL OF EVERYTHING FOR THE GARDEN



For 1889 is the handsomest and most complete Garden Guide ever published. It is really a book of 140 pages, size 9 x 11 inches, contains *three colored plates*, and illustrations of all that is new, useful and rare in **Vegetables, Flowers, Fruits** and **Plants,** with plain directions "How to grow them," by

Peter Henderson

This manual we mail to any address on receipt of 25 cents (in stamps). **To all** so remitting 25 cents for the manual, we will at the **same time** send free by mail, **in addition,** their choice of any one of the following **Splendid Novelties,** most of which are now offered for the **first time,** and the price of either of which is 25 cts.: One packet of *Autumn King Cabbage*, or one pkt. of *Yosemite Mammoth Wax Bean*, or one pkt. *Delmonico Musk Melon*, or one pkt. *Giant Pansy*, or one pkt. *Scarlet Triumph Aster* (see illustration), or one pkt. *Sunflower, "Silver and Gold,"* or one plant of the climber *Blue Dawn Flower*, or one plant of the *White Moonflower* or one *Bermuda Easter Lily*—**on the distinct understanding,** however, that those ordering will state in what paper they saw this advertisement.

THE DINGEE & CONARD CO., Rose Growers and Importers, West Grove, Pa.

Humorous.

ROSES.

THE PLAINT OF THE BELLE.

I DREAD the very sight of them:
My tired eye closes
At glimpse of blush, or bud, or stem
Of proffered roses.

To sniff them all, I'd need, at least,
A dozen noses;
I'm sure my nostrils have increased
From smelling roses.

For too much of a good thing, mark,
One's mind disposes
To base ingratitude—then, bark—
Don't send me roses!

I know this edict seems unkind;
It so forecloses
The satisfaction that men find
In buying roses.

Why can't they guess that woman needs
For all her poses,
Gloves, laces, slippers, fans and beads
Far more than roses?

Ah, no! My future's door ajar
But this discloses—
More men who struggle from afar
To bring me roses.

SCAB H. C. & J. C. GROOME, of Locust Hill Stud Farm, Wythe county, Va., say of THYMO-CRESOL (The Cold-Water Dip): "*It has been with us notably successful in curing Scab in Sheep, in an advanced stage. We have found the growth of the wool materially promoted by dipping Sheep in it early in autumn. It destroys Lice on Colts, is a most useful dressing for the Hoofs of Horses, and a valuable remedy in cases of Grease and Thrush. We have found it a speedy cure for Mange, and as a Disinfectant and Purifier its merits cannot be too highly commended. In fact, the limits of its usefulness to the stock-breeder are difficult to realize, and here we should be inclined to feel quite helpless without it.*" Imported only by T. W. THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII. NO. 2033 NEW YORK, JANUARY 12, 1889. PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered According to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

HOW HE LOVED HER. (With the R. N.-Y.'s Apologies to Puck.) Fig. 4.

The Vineyard.

THE NIAGARA GRAPE.

1871 and 1889.

DID THE R. N.-Y. DECEIVE ITS READERS?

THE RURAL'S ESTIMATE OF THE NIAGARA IN 1871.

THE ESTIMATE OF EXPERTS TO-DAY

The Value of a Candid Rural Journal That Tests Novelties and Renders Impartial Reports.

Estimates from Pres. T. T. Lyon, Pres. P. J. Berckmans, P. M. Augur, J. J. Thomas, P. Barry, T. V. Munson, N. Ohmer, Prof. J. L. Budd, W. D. Gunn, Sec'y G. W. Campbell, Sec'y E. Williams, Mrs. Jack and Thaddeus Smith.

IT was in the fall of 1879 that a vine of the then unknown Niagara grape was sent to the Rural Grounds for trial—the only vine which the company cared to intrust to outside hands. Our earliest estimate of this now famous grape is our estimate to-day, viz.: that its chief good points are size, showiness of bunch, vigor of vine. We pronounced it of no better quality than the Concord. The R. N.-Y. popularized the Niagara, it may truly be said, just as its impartial reports of all new small fruits have either killed or popularized most of the varieties that have been introduced during the past 10 years. This is as it should be. The labor, time and care required to plant and observe novelties are quite beyond the editors of most farm papers. They are, therefore, constrained to make their reports from what others say. Below we give the estimate of many of our leading grape authorities and vineyardists. Our readers will draw their own conclusions as to the actual value of the Niagara as well as of the wisdom of the course the R. N-Y. has pursued regarding it. Our record is before our readers and we could not recall it if we would.

Our illustration is engraved from a photograph of three bunches raised and presented to the R. N-Y. by Secretary E. Williams, of Montclair, New Jersey.

FROM CONN. STATE POMOLOGIST P. M. AUGUR.

The Niagara is one of the most beautiful of our white grapes. In quality it is about equal to Concord. It is hardly as reliable for a sure crop as the latter. When it makes a good yield I think it will bring a larger price per pound or ton. In respect to its hardiness, it is not equal to the Concord with me. It has been a very vigorous grower but has killed back somewhat. In this respect it is not equal to the Pocklington which has proved perfectly hardy. In some localities it fufills all that has been claimed for it. The reliable varieties are Delaware and Brighton for red, with a good promise for Ulster; Moore's Early, Concord and Worden for black; and Hayes, Pocklington and Niagara for white, with some allowances for unfavorable seasons and localities.

Middlesex Co.

FROM PRESIDENT T. T. LYON, OF MICHIGAN.

I think the Niagara as a white grape, occupies a somewhat higher position than does the Concord as a black grape. It is yet too soon, perhaps, to determine how far its popularity as a market grape will be affected by its color. Time should be allowed to dissipate the feeling of novelty before this can be determined. At present it commands more attention and better prices in the market than does the Concord, added to which is the fact that it is somewhat more productive. It is considered to lack slightly in hardiness of vine, but not to an important extent, save, perhaps, in unusually trying localities. The originator and introducers have been conservative in their claims, so far as commendations of the Niagara are concerned, and I think it must be conceded that their assurances in this respect have been pretty fully realized. I know of no variety that, to-day, promises better as a profitable market grape. Its strongest competitors, aside from the Concord, are Worden, Pocklington, and perhaps Brighton. How far the Empire State and Diamond will be able to compete for the leadership, in this respect, is a question for the future.

Van Buren Co.

FROM PRES. P. J. BERCKMANS, OF GEORGIA.

The Niagara grape as regards size and appearance of bunch may be classed among the profitable market varieties, providing it can be kept free from rot. If in sound condition it will bring double the price of Concord. The vine is hardy, a vigorous grower and quite free from disease. It does not in my opinion fulfill what was expected from it, owing to its general tendency to rot, and its conduct during the past season was especially disastrous in that respect. Delaware is far more valuable for market. Even the Ives and Concord have paid better than the Niagara during the past season.

Richmond Co.

EROM J. J. THOMAS OF UNION SPRINGS, N. Y.

The Niagara grape combines several good qualities, each moderate in itself. It is a strong grower, and a great bearer, has handsome and attractive bunches, and, unlike the Concord, it bears long conveyance by railway. People differ as to its quality, some preferring what they term its "aroma," while others dislike it for its "foxiness." It would be just, however, I think, to place it as high in quality as the Concord. Its showy appearance assists it well in selling in the market; and I observe that it commonly stands higher in the market reports than most of our common varieties. Like other grapes, it is liable to rot, and in some localities it has been badly injured. At present, it is a good grape to plant for market, as it grows fast, and bears soon; but many large vineyards having been planted, the market in a few years may be over supplied.

FROM PRES. P. BARRY, ROCHESTER N. Y.

I regard the Niagara as a valuable white grape—I consider that it ranks among white grapes about as Concord does among black. It is hardy, vigorous and productive and quite free from disease here. I think it substantially fulfills the promises of its originators. The Niagara for a time, while it was a novelty, commanded the highest market price; but the price has dropped pretty low and will go lower. Black and red grapes will hold the price better. For profit I would rather plant here, in W. New York, Concord and Worden; but the Niagara is worthy of a place in all market plantations here.

Monroe Co.

FROM ANNIE L. JACK, OF CANADA.

The Niagara is a profitable grape, but it is somewhat injured here by late and early frosts. It is more valuable than the Concord because it brings a better price per pound in our market while bearing fully as well. It is free from disease so far, but many of the vines die every winter in exposed places, and it needs protection. It fulfills the promises made in its behalf as to fruit-bearing; but this season it failed to ripen its fruit thoroughly. It has no recent competitor for market because the public demand a big, showy grape; otherwise the Duchess would stand first for market as it does in quality and keeping properties, and it is also prolific even when the vines are young.

Province of Quebec.

FROM T. V. MUNSON, OF TEXAS.

My opinion of the Niagara grape is that the vine is vigorous and productive. The clusters and berries of a white grape are very attractive when not attacked by rot, which devastates it even worse than it does the Concord. In quality it is about the same as Concord except that the musky, "foxy," Labrusca flavor is more intense, a serious objection in the estimation of lovers of pure-flavored grapes, especially of the Vinifera species. Yet numerous Americans love the "foxy" odor and flavor. I think it not superior to Concord in any way. The above qualifications render the Niagara as a white grape nearly an equal of the Concord as a black grape, and hence, where the Concord is very successful and profitable, the Niagara will likewise prove of about equal worth. As to fulfilling its originator's promises, I cannot say, as I have made no close comparison of the result with such promises. In fact, I do not well remember what was promised exactly; but I can safely venture the assertion that it has come as near to fulfilling what was claimed for it as any of the new varieties recently introduced. Owing to freedom from rot and to earliness the Delaware, Ives, Moore's Early, Worden, and Cottage I think fully as profitable or more so. In regions where rot does not prevail, the Brighton will be more profitable, being a handsome red, early, of fine quality, and prolific. The Woodruff promises to do still better with less rot, and (if an originator's opinion is worth anything in this connection), I feel confident that I have produced several varieties which will outrank those mentioned, and yet there is large room for improvement ahead before we can equal numerous Vinifera varieties in beauty and quality. Still I am confident that we have native material which will some day be brought to equally as high a standard of excellence. There is a new grape, Progress, (some think it a synonym of the Norfolk), which ripens about with the Cottage or Worden, and is of the same size in berry and cluster as the Catawba, and fully equal in quality, with less sour pulp, and not so subject to rot so far with me. It is a clear, lively red, about as handsome as the Delaware, and I believe it will take a very high rank when known. The vine is very vigorous, hardy and prolific. As a fine late white grape, the Triumph is without a rival in the South.

Grayson Co.

FROM SEC'Y N. OHMER, OF OHIO.

I have not had the Niagara grape in bearing long enough to answer the RURAL'S questions satisfactorily. I think well of the Niagara, however, and believe that it and the Concord make a good team.

Montgomery Co.

FROM PROF. J. L. BUDD, OF IOWA.

The foliage of the Niagara does not meet the requirements of our summer heat and great aridity of air at times. The Concord is all right with us on suitable soil and its fruit matures in our climate more perfectly than at the East. The Niagara wholly fails east of the Missouri divide and on the loess soils of the Missouri slope it only succeeds partially. Mr. Silas Wilson, of Atlantic, who has had it on trial longest, has no words of praise for it. West of Lake Michigan it has not fulfilled the claims made for it. Concord, Worden, Moore's Early, Telegraph, Cottage, and Pocklington are far more profitable on the prairie soils.

Story Co.

FROM W. D. GUNN, OF ULSTER CO. N. Y.

The Niagara has acquitted itself so well the past season, both in product and prices, as to enhance its value very materally in the opinion of growers hereabouts, and it is taking first place among the whites as a market grape. It is more valuable as a white grape than the Concord as a black. It is as good a bearer as the Concord, while it has brought prices far above those of that variety, and somewhat better than those of other white varieties. In this locality it has proved hardy and vigorous, when necessary care has been given. Heavy soils, with considerable admixture of clay, have been found better adapted to its growth and fruiting than sandy or gravelly loam, or even slaty soils. It has less rot than some and more than other varieties,—and is comparatively free from mildew. It has very nearly come up to the claims made in its behalf. Perhaps in drier seasons than the past, less favorable to the development of rot and mildew, it may entirely fulfill the promises of its originators. According to the outcome of the past season, I know of no more valuable grape for market.

FROM SEC'Y GEO. W. CAMPBELL, OF DELAWARE, OHIO.

I have seen no reason, with further observation and experience, to modify or materially change the opinion which I have heretofore expressed of the Niagara grape through the columns of the RURAL. As to whether it is more or less valuable as a white grape than the Concord as a black, I should say that for general use, it will be found less valuable. At the same time, for special localities which are well adapted to its culture, it may be found even more so. The reasons for this may be found in the answer to the questions about its hardiness, vigor, freedom from disease, etc. In hardiness, or ability to endure severe cold uninjured, it does not compare favorably with the Concord; for I have found the wood and fruit-buds of the Concord remaining unhurt under the same temperature and exposure during the winter, that injured the wood and killed the fruit-buds upon the Niagara. I would not think it safe to plant the Niagara for profit without giving it winter protection, in any locality where the thermometer is liable to fall much, if any, below zero, during the coldest seasons. In vigor of growth, and also in productiveness, I regard it as fully equal, if not superior to the Concord, under favorable circumstances, and not more liable to rot in sections and seasons where that malady prevails. The Niagara is more subject to diseases of the foliage than the Concord; but not more so than Brighton, Jefferson, and the best of Rogers's Hybrids, or the Catawba. As to whether the Niagara fulfilled the promises made by its originators, I should say that in some respects it has; in others, I think it has not. The representations as to the vigor and productiveness of the vine appear to have been fairly realized. But the statements that it was "as early as Hartford Prolific," and that it would endure "35 degrees below zero" uninjured, were certainly not warranted. It seems rather slow in coming to perfect maturity, although it partially ripens and is often sent to market with the Concord, and those who have been accustomed to buy unripe Ives and Talman or Champion would, doubtless, call it good. I have, however, found it from one to two weeks later than the Concord in reaching its best condition; but it is then, to my taste, much better than the Concord, and it loses nearly all of that foxiness which is so prominent if it is gathered earlier and before it is really ripe. In my experience the vines have invariably suffered injury when left exposed on the trellis during the winter, if the thermometer has fallen to 10 or 15 degrees below zero. Thirty degrees below zero in my locality would kill every Niagara vine to the ground.

To mention what grapes are more valuable for market than the Niagara is more difficult, so much depends upon the situation and surroundings. For those places where grape growing is precarious, and where early-ripening, hardiness of vine and health of foliage are necessary to success, Moore's Early, Lady, Worden, Pocklington, Concord, and, perhaps, others of the pure Labrusca type would be more valuable. But wherever the conditions of soil and climate requisite for growing the Niagara to perfection can be found, or where the cultivator will give the necessary protection, and employ the preventives against diseases of the foliage and fruit, which recent discoveries and experiments have demonstrated to be practicable, I believe the Niagara will be found one of the most valuable and profitable market grapes yet introduced. The Empire State and the Pocklington are perhaps its most formidable rivals. In vigor of growth and hardiness in winter I have found little or no difference between the Empire State and the Niagara, though I thought at one time the Empire was the hardier vine. In health of foliage, the Niagara has always shown more mildew in unfavorable seasons. As to productiveness, the Niagara averages larger clusters, and larger berries, and I think the vines will carry a larger weight of fruit. Their period of maturity with me, has been very nearly the same, both requiring to hang longer upon the vines to attain their best flavor and highest character than is permitted by most growers. The quality of the Empire State is, to my taste, much superior to that of the Niagara, being entirely free from foxiness, and having something of the high and delicate flavor that pertains to the best foreign varieties. The Pocklington seems to have hardiness and health of foliage quite equal to the Concord, with great productiveness also, and some tendency to over-bear. Its growth has not been as strong as that of the Concord or Niagara, and a judicious and early thinning of the fruit by cutting out the small or imperfect clusters would be very desirable, and would result in better grapes, handsomer clusters, and better condition of the vines. The Niagara can usually be put into market a few days earlier than the Pocklington, though the latter ripens more rapidly, and arrives at its best condition. I think, quite as early as the Niagara. In quality there is not much to choose between the two; and of those who have tasted both in comparison, in my presence, the majority have preferred the Pocklington. This, however, would not agree with my own taste, as the Niagara, when fully ripe, retains less of the foxy taste and odor.

THE NIAGARA GRAPE. From Nature. Fig. 5.

FROM THADDEUS SMITH, OF PELEE ISLAND, CANADA.

My experience with the Niagara grape has not been long enough to enable me to form very positive opinions in regard to its merits. I planted 200 vines in the spring of 1884 and my knowledge of the grape comes from my observation of these vines and their fruit. My present opinion is that the Niagara is a hardy, strong-growing, productive vine, producing fruit of medium quality in large clusters and berries. In comparison with the Concord, it is not as vigorous a grower, nor as free from rot and mildew. I do not think that it will prove to be as popular over so large an area of country; but for the present it is likely to be the most popular white grape upon the market. It is very hardy—neither bud nor vine has ever been injured by cold here. It is a strong grower, but not as vigorous as the Concord, Empire State. and some other varieties. It is not entirely free from rot and mildew. My vines were somewhat affected by both this year, but were not injured enough to materially affect the amount of the crop. I gathered a little over a ton of sound grapes from my 200 vines on about 50 rods of land, or about at the rate of four tons per acre. Some of these would have done for shipping for table grapes, but as the bad ones would have had to be picked out, and the market was poor, I did not ship any.

The variety has not fulfilled the promises made for it by its introducers. They promised too much, probably too much for any grape. I consider the quality only second rate. But this is somewhat a matter of taste, as I have known persons to prefer to eat the Concord rather than any other grape, and there are some who like the sweetness of the Niagara regardless of its strong "foxy" flavor. A correct or cultivated taste can never give. preference to the Concord or Niagara over such standards of excellence as the Catawba, Iona and Delaware. The Catawba here, and some earlier grape, like Moore's Early or Worden, are more profitable; but this might not apply to other places.

Province of Ontario.

FROM SEC'Y E. WILLIAMS, OF MONTCLAIR, N. J.

The Niagara has fully met my expectations, for it was an untried venture when I planted and attended with some misgivings as all novelties are, but it has succeeded so well with me that I have no reason to regret having been called a lunatic for making my little venture. It is true the Niagara is not perfection in every respect as a white grape, (I did not expect that, neither do I expect to ever find a grape of any kind that will do equally well in all soils and situations in this broad land of ours); but it comes nearer that position than any I have tried, and, with me, stands head and shoulders above its competitors introduced at the same time. I consider it the most valuable white grape I have, and in comparison with my other white grapes, as regards size and beauty of berry and cluster, etc., all others are nowhere. The Concord has many competitors—strong ones too. The Niagara vines are apparently as hardy and vigorous as those of the Concord, but probably a little more liable to mildew and rot; but I have had Concords that rotted fully as badly as the Niagaras. These troubles—rot, and mildew—are the most serious difficulties I have to contend with; yet I have fought them with considerable success thus far, and I have hopes that we shall ere long be able to entirely overcome them. The hardiness of vines—which is generally understood to mean the ability to pass a winter of low temperature—is often dependent on freedom from mildew, as a mildewed vine will not stand the exposure that one will that has not been affected with this fungus. I cannot say positively whether the Niagara has come up to the claims made for it originally, without referring to the promises made at the time of introducing it; but if every novelty in the fruit line came as near "filling the bill" as the Niagara grape has, there would be little cause for complaint. I have said it was not perfect. Its chief fault—aside, of course, from its liability to mildew and rot—is its tendency to drop from the cluster soon after reaching maturity. Of course, this dropping is sometimes due to mildew, oftener perhaps than we suspect, but there appears to be, when it is fully ripe, a weakness of the grapes in holding on the peduncle. I sometimes think this is due in a measure to a condition of the vine which may be overcome, but I have not yet experimented sufficiently to decide. I have none that is more profitable. In my collection of over 50 varieties in full bearing the three *best* red, white and blue are Brighton, Niagara and Worden. This has been my opinion for the past three or four years, and I can't get beyond it yet.

Horticultural.

CHRISTMAS VEGETABLES.

WILLIAM FALCONER.

Frequent scarcity of good vegetables in the country; their abundance and excellence in cities; small profits for producers there, owing to competition and to the necessity of prompt sales; why supplying private customers in cities is generally impracticable; local vegetable growing for country villages a growing and profitable business; a supply there creates a demand; a notable case in point—from two acres of garden heavily mortgaged, to six acres free from mortgage and with abundant prosperous surroundings; a like success easily possible in every village of the country.

IT is a fact that many country folks are pretty ill off for green vegetables at Christmas time. True, they have cabbage in abundance and some celery and these are all very good in their way, but they do not furnish variety enough; our appetite craves for variety and our health is profited by it. In the matter of a variety of green vegetables in winter, city folks are a good deal better off than are country people, for, in addition to the vegetables furnished by our local market gardeners, fresh green vegetables are sent hither all winter long from Florida, and the other Atlantic Southern States. There is a current idea that city vegetables are stale, and that if one wishes for really nice, good, fresh vegetables he must go out into the country to get them. Well, nothing will dispel this idea better than a visit in the early morning to some of our metropolitan vegetable markets. Here will be found not only a large variety of all manner of seasonable vegetables, but everything is fresh and of superior quality and can be got at almost starvation (to the grower) prices. The stale vegetables get stale after they leave here. Truck gardeners get little enough for prime produce, but for inferior vegetables they wouldn't get enough to pay them for gathering and hauling them to market, let alone growing them. Don't regard the prices charged consumers by retail grocers as anything approaching the prices the poor gardeners get.

The market gardeners around large cities must seek a city wholesale market; their produce is large and perishable and they can't hold it over nor dilly-dally about selling it; they must sell it in bulk and just as soon as it is marketable. It is no use talking of drumming up a private connection and disposing of the crop directly to the consumers; if a gardener had 20 sons in the business with himself this might be all right; but he himself could not attend personally to every little detail of the business. The milkman has his regular customers for his milk, so too may the gardener for his vegetables, but customers don't want vegetables every day nor do they want the same sort of truck all the time, and to supply what they want takes too much time, patience and expense for the city market gardener. Then what about the hotels? Hotels go to market and buy at wholesale prices. Then how much better off would the gardener be for selling to them? Besides, no one gardener grows all the sorts of vegetables required by our hotels, nor would any hotel be likely to need everything the gardener has upon his wagon. This being so, what's the use of either of them making two bites of a cherry? Why shouldn't both go to the wholesale market? But in country towns and villages distant from large cities the case is different. There is profit—a big profit—in gardening at home. Don't growl about your sleepy village; don't complain because everybody has a garden of his own and won't want anything from anybody else's garden; don't scare yourself because there isn't a vegetable now sold in your village. Just consider these questions. In your village this day

Can you buy a dish of fresh spinach for your Christmas dinner?

Can you buy a dozen heads of prime celery?

Can you buy a dozen white-hearted lettuces?

Can you buy a dozen milk-white cauliflowers?

Can you buy a peck of Brussel's sprouts?

Can you buy a bunch of fresh, crisp radishes?

Can you buy a bunch of fresh young parsley?

Can you buy an eight months (only) old stick of horse-radish?

Can you buy a quart of green chives?

Can you buy a quart of fresh mushrooms?

Can you buy a bunch of green thyme, or green sage, or green mint or green chervil?

If you can buy any of these, is it grown right in your village or is it brought there from a distant city? If it isn't grown in your village, don't you think it would pay some of you to grow it there? And if you cannot buy it at all in your village, don't you think your village is pretty far back? Yes, and it is just your own fault. You can grow and supply your villages with these things, and you can make a deal more money by doing so than you can by growing corn and potatoes.

There is nothing fictitious about these vegetables at this time of year. I have every one of them here right now, and so can you have them at your home and make money out of them, and that, too, with no great exertion. And you haven't got the great expense of a team a whole day off at a city market, nor do you get the short wholesale figures for your produce; no, you get a fair retail price. But who would buy these vegetables if you had them to sell? Every mechanic and merchant in your village and even your next-door farmer-neighbor. You needn't shake your head and say you know differently—that I "don't know the kind of folk in these parts." We all know that supply creates demand. If these vegetables are not presented to your people, can you expect them to run around looking for them? No, for they won't do it. But you take half-a-dozen milk-white cauliflowers, fresh cut this morning, half-a-dozen solid-hearted lettuces, white, fat, crisp, and plucked to-day, half-a-dozen heads of celery, white-bleached to the tips, and so tender and crisp that when you'd bite a leaf one could smell it half a rod away; do you think there is a family in your village who wouldn't crave that basketful of vegetables for a Christmas treat?

But let me come right home to our own village here. Everybody hereabout has a garden and grows vegetables more or less, and at our principal stores vegetables in their season are exposed for sale the year round. Some of these are grown by the farmers around and sold to the stores, and what isn't raised hereabout has to be brought hither from the city, both supply and demand being moderate and modest enough. Four years ago one of our workmen having saved a few hundred dollars, bought two acres of land in the middle of the next village to this. The land cost him $1,000 an acre. He paid $200 down and gave a mortgage for the balance. Then he built a $500 house upon his land. And he set in to grow all manner of fruit and vegetables depending upon the village market alone. He worked from daylight till dark and even with lamplight. It was a little hard at first and the market was slim. It is only four years since he bought the place, but he now owns six acres there and has built himself a barn and greenhouses and many hot-bed frames. He has a horse and wagon and employs several men. His land is full to overflowing of everything likely to be required for furnishing the village folks' gardens—fruit-trees, grapevines, roses, etc., and three-fourths of his land is devoted to vegetables. He has formed a wide connection among the village people and he is yet unable to supply the demand—yes, the very demand that didn't before exist. He grows prime stuff and a good variety of it, and takes it around in his wagon and peddles it. Nothing is left over, everything is sold, and the people are asking for more. The people know now where they can get good vegetables, fresh-gathered the day they buy them, and they see and seek many a vegetable they never before passed a thought upon; they know the day the gardener comes around, for he has his days and his routes and his customers as the milkman or butcher has his, and they prepare for him accordingly.

And this man is making money fast, yes, more money than any farmer round about here. The people all know he is making money and they look upon him as a god send to the village, and now wonder how on earth they got along before he started business here. And apart from the mature vegetables he raises and sells in the spring time, he raises any quantity of egg plants, peppers, tomato, cabbage, cauliflower, lettuce, and other plants for sale. This too is a blessing to our village folks. Many of them much prefer to buy the young plants than to bother raising them themselves, and when they know they can get them right here, good and cheap, they plant freely and sorts they did not before try to grow. But isn't this bad for the gardener? Not a bit of it. He gets his chief supply in before and after the glut. He uses his brains as well as his hands. And now every one who wants anything in the garden line, naturally goes to this place. People are drawn to it, not only to get what they want, but also to see it; it is one of the most interesting spots in the neighborhood, always beautiful, neat and clean, and always blooming, and everyone who comes almost always sees something that he would like to have at home, and as everything is for sale, it means some pennies more.

Now in every village in the country haven't we got one or more farmers who could add just such an adjunct to their present business? You don't know how, you haven't got the experience, are lame excuses nowadays. You can raise cabbages, and sweet corn, and carrots, and beets and a host of other vegetables, just as well as anybody. And any one who knows this knows enough to start well. Use your brains; don't rush into the thing till you know the road: carefully note your successes and failures as you go along; be determined and persevering, and every step you take will be suggestive, and at the end of a couple of years I guess you will have learned from your own practice more than any one else could teach you.

CORRESPONDENTS' VIEWS.

JAPANESE BUCKWHEAT ONCE MORE.—In the spring of '87 I bought one pound of Japanese buckwheat, sowed it on July 3, and harvested and thrashed 4½ bushels of very plump seed. This year, I sowed half a bushel and thrashed 30 bushels, and this though it has been a very poor year for buckwheat. One of my neighbors sowed about the same amount of ground with gray buckwheat and got only one bushel and three-quarters. As for bees not working on it, my bees worked on it continually both years. RURAL SPECIAL REPORTS.

Illinois.

ALEDO, Mercer Co., Dec. 24.—We have had very fine weather for the last two months. Corn is all gathered in very good condition and is selling at 23 to 25 cents per bushel; oats, 23 to 24; not much wheat is raised here; it sells at 80 cents. There is a good demand for stock cattle at 3 to 3½. There are a good many fat cattle here which have not been sold yet; prices are unfavorable for the holder. About half our fat hogs have been shipped at from 4½ to 4¾ cents per pound. All kinds of stock look well and there is plenty of feed. I hear some complaints of scarcity of water, for we have had very little rain this fall so far. The ground is frozen slightly at present.

C. N.

Indiana.

HARLAN, Allen Co., Dec. 23.—We have had a very fine fall this year for doing work. It has been dry and warm. There has not been rain enough to start the under-drains, although there have been some light showers, so that wheat looks tolerably well. We have had no snow yet, except some little flurries.

I am going to try to raise some potatoes on the Trench System next summer. S. M.

Iowa.

LIMA, Fayette Co., Dec. 22.—Farming here is mixed. Very few sheep, and a good many horses are raised. We farmers have done better this year than during the two last, as the crops have been better. We have had more rain, but not enough. Corn was a large crop, but some of it is soft. It is selling at 25 cents per bushel. Oats good in quantity, but not in quality: selling at 18 to 20 cents per bushel. Potatoes good in quantity and quality—25 cents per bushel. There is a large number of creameries in this county. Butter is worth 20 to 25 cents per pound; eggs 16 to 20 cents per dozen. We have had a splendid fall and winter so far; there has been no snow to speak of, and the weather has not been so cold as one expects at this time of the year. If we had more rain it would be good for the wells and springs. P. E. J.

Kansas.

WRIGHT'S P. O., Ford Co.—Three years ago I left the eastern part of this State for the southwestern part, and filed on 40 acres of homestead land two and a half miles from Fort Dodge and five miles northeast from Dodge City, near A. T. Soul's great irrigating canal. Nothing to speak of has been raised in any of the western counties of the State for the two past years, and it has been fully

demonstrated that there is no certainty of a crop of any kind without irrigation, for it is sure not to rain when crops most need moisture, and the hot winds burn up corn as a general thing; so, with hail, chinch bugs, hot winds and drought, this is the most miserable country that the sun ever shone on. The water was turned into the canal for a week or so last spring and every one thought he would raise a crop, but all at once the Arkansas river went dry and remained so all summer; but about two months ago the dam settled a number of feet and caught the undercurrent, and that soon filled the canal with water in abundance, so we poor grangers can get water all over our farms and next year will tell the story. If a success, this land is worth $100 per acre. C. L. S.

PLEASANT VALLEY, Lincoln Co., Dec. 17.—We hope for more rain next season than we have had during the past, so that we can raise at least enough to eat. For the last two years farmers have failed in everything in this section, and starvation or heavy indebtedness stares them in the face, all owing to the lack of a little rain at the right season. I don't see how any farmer can do without the RURAL. I'm sure it costs me nothing. The seeds alone have been worth more than the cost of the paper. Success to the RURAL!

H. R. M.

New Hampshire.

SOUTH SUTTON, Dec. 15—It has been a hard season for farmers in this section. A late spring, an early frost, and a wet fall damaged all the crops one half, except hay. Stock, too, is very low in price and there is no demand. All around here times are pretty hard with not much help and high wages.

We prize the RURAL very much indeed, and it brings to this home many pleasantly spent hours. H. B C.

New York.

FORESTVILLE, Chaut. Co., Dec. 21.—The past season has been one of mixed results. Grapes, which were a large crop, brought the farmers of this county over $800,000. By the way, the grape business has made rapid strides here for five years past. Land which a short time ago could have been had for a song, is now selling readily at $100 to $150 per acre. Potatoes and corn were good crops; oats fair; hay light; consequently fodder is scarce and high. A great many farmers are selling off their stock at low figures, which I fear they will regret doing when the dairy season opens in the spring. What can farmers do without the cow, the sheep and the ox? How is the fertility of the farm to be maintained? Can it be done with commercial fertilizers alone? Men who have tried doing so tell us no. Then, why sell the cow? It seems to me that farmers must be blind or out of their heads, who sell their stock thinking that by so doing they can sell all the products of the soil, taking everything off and putting nothing back, and yet hope to prosper. The cow is the great balance-wheel of the farm. Take her off, and the little wheels will soon stop still. It takes a long time to reclaim old, worn-out land that has been farmed by these anti-stock fanatics.

Brother farmer, do unto your farm as you would have your farm do unto you, and the rural crown of prosperity will deck your brow.

C. H. F.

ALTAMONT, Albany Co., Dec. 21.—Although I have been a subscriber for the RURAL for only about six months, yet I think it is the grandest paper of the kind that I ever saw. Altamont is a charming summer resort about 17 miles west of Albany, at the foot of the Helderbergh mountains. Farming in this section is rather mixed, hay and grain being the most important. Crops the past season were fair on the whole. Potatoes were a failure with some; apples in some parts of the county were plentiful.

Prices range about as follows—corn, 80 cents; oats, 43 cents; wheat, 85 cents; rye, 65 cents per bushel. Potatoes $1.25 and apples $1.50 per barrel. Hay from $10 to $14 per ton. Wages are fair; farm hands get from $17 to $20 per month. J. H. F.

Pennsylvania.

ELIZABETHTOWN, Lancaster Co., Dec. 24.—Farmers were able to plow this fall until December 13th. Scarcely any snow has fallen, and at present there is every indication that fair weather will continue at least to the end of the year. Butter is getting scarcer and higher every year in this vicinity, owing to creameries being built every few miles. These send teams out among the farmers to gather the cream and milk. One creamery alone at a small village called Ridgeville has seventeen teams employed. Butter is 33 cents per pound; eggs, 24 cents per dozen; lard, 11; wheat, $1 per bushel; corn, 55; oats, 35; potatoes, 50 cents. Tobacco, one of our chief products, has been nearly all sold, some selling as high as 20 cents per pound for Havana seed. Nearly every farmer slaughters four to eight hogs and one or more cattle for his own use, always turning some of the meat into pudding and sausage, which cannot be excelled and rarely equaled in quality by any other section of country. W. C.

EVANS CITY, Butler Co., December 25.—This has been a very wet fall and winter so far. Wheat was a fourth of a crop. Oats were good. Corn and potatoes full crops. Hay was only a half crop owing to drought in the spring. The acreage of wheat sown this fall was not so large as usual. This is a mixed farming country anyway. I like the RURAL very much; it gives good information on farming and everything else. J. H.

Vermont.

PERKINSVILLE, Windsor Co., Dec. 25—The past month has been one of exceedingly unfavorable weather. There has been no snow at all, excepting flurries, and traveling has been anything but pleasant on the frozen ground. Some snapping cold weather has been experienced, with high winds, and stock has suffered severely where the barns were not extra warm. Many of our farmers feel discontented because of the loss of the crops, but yet they have many things to be thankful for. No wood or lumber is moving yet, although much is being cut. Complaints are common against the ordinary dry wood. Unless dried under cover it is worse than green it is so badly damaged by wet weather. Even the wood worked up under sheds is faulty and moldy because of the dampness. The weather lately has been remarkably fair, but snapping cold. B. H. A.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

PORK GROWING IN THE SOUTH.

W. K., Ontario, Kans.—I am thinking of going South to make a specialty of hog raising. After reading Henry Stewart's article on the Southern hog in a late RURAL, I want to know whether he refers to the Berkshire, Poland-China, Chester White, or Duroc-Jersey, or does he refer to the native rail-splitter?

ANSWERED BY HENRY STEWART.

The Southern hogs are unfortunate in their bringing up—so to speak—rather than in their progenitors. They are evidently descended from the best breed, the Essex and the Berkshire mostly, for the majority are black, or black with remains of the Berkshire points, viz., white feet and a white spot on the face. There are a good many of the sandy or reddish-brown kind which may be the descendants of the old Red Berkshire or the Red Jersey or Duroc breed or of both. Having been much neglected, poorly fed, or not fed at all, except on the mast, they are small, thin, and great eaters, although making but little growth for the food they eat. But it is a question after all, if they are not the best hogs under the circumstances in which they are kept and the most profitable. At first sight of these slab-sided, long nosed and long-legged creatures with big jaws and thin, long necks around which the cracked bells are hung by straps so they can be easily hunted up in the woods, I thought they must be wretched things and utterly unworthy of one's notice. But I have traveled considerably and have learned that it is not safe to despise the ways of the natives in any locality, "who are to the manner born," and perhaps understand their own affairs the best. And since then I have tested these hogs and have found them to be not only able to live where a high-toned, pure-bred, pedigreed pig would perish, but able to do well and make fair growth when well cared for. For instance, I purchased, as a test, a sow with seven small pigs for $7, and a boar for $5. These pigs ranged in a wood lot all summer, living on last year's acorns and chestnuts, together with grass and roots of various kinds. They did quite as well as any better pigs I have had on clover pasture. In the fall, I put up the seven pigs to fatten on boiled potatoes, bran, corn meal and skimmed milk, and made over 700 pounds of pork at an actual cost of two cents per pound. The meat can be sold now readily for 10 to 14 cents a pound, which has been the ordinary price for bacon not as good as this for some years past. This has been a bad mast year so that hundreds of pigs have died in the woods of starvation, which, however, is not unusual, at least the deaths, for, when mast is abundant, the pigs die of cholera, so that this experience, as regards the profi of feeding swine here, is not unusual at all. Last year I made an estimate of the cost of growing pork here, for the State Agricultura Department, and I put the cost at three cents per pound; while pork has always sold for five years past at from 10 to 15 cents a pound. With ordinary care in breeding these native pigs which seem fitted by nature for their environment, ranging them in the summer and fall and feeding some milk along with the mast when abundant, and with bran and corn when it is scarce, they will, I am sure, in spite of their naturally, or, more truly in fact, unnaturally poor and woebegone looks, make more profit than any other pigs in any other place I know of. As the South, and especially the mountain region of it, is especially well adapted for the dairy—I am selling butter for 35 cents per pound which does not cost, all expenses told, five cents—and pork growing will go exceedingly well with it by the use of skimmed milk, I am confident this business alone or combined with the dairy would afford a very handsome profit. There are many wild hogs, upon rough parts of woodland, which have escaped from cultivation, as might be well said, and which have never had any other food for years than the mast, the Bunch Grass and the roots, nor any other shelter than hollow trees and beds under shelving rocks—very good shelter, too, by the by. If the native hog does so well, I think civilized Berkshires, fed upon the easily grown clover pastures and the nuts in the woods with milk only added, in average years would furnish pork for less than two cents per pound. My $12 venture has given me $70 worth of meat, with the sow and boar on hand, and a second litter now weaned and worth, as they run, $14; the total cost has not been more than $3, and $3 more will carry the stock to next fall, when, with a good mast year and another litter due in the spring, there will be $100 in sight, with no cost except the feeding with skimmed milk. This is a true, unvarnished tale of pork growing in the South.

BITTER OR SALTY MILK.

W. H., Albion, Idaho.—My three-year-old Holstein cow had a calf when 22 months old, and has never thrived since. She has a good appetite but is very thin, and her milk has always had a bitter taste, and it is now salty in addition, besides being quite dark in color. She is fed good Alfalfa hay with a change to wheat and oat hay with a bucket of cut oats in the sheaf. What should be done for her?

ANSWERED BY DR. F. L. KILBORNE.

Bitterness of the milk may result from several causes. Perhaps the most common cause is that due to the change in the milk which often takes place during the last two to four weeks of the period of gestation. Cows usually dry off naturally a few weeks before coming fresh again, but a few cows, mostly heavy milkers, will continue the flow of milk up to the time of calving. In such cases the bitter or salty milk warns you that the cow is soon to be fresh again, and that she ought to be dried off as soon as possible. Dairymen usually dry their cows off at least four weeks before they are due to calve. Certain foods will give to the milk an unpleasant or bitter taste. In such cases the remedy is simply to give a change of food, or to reduce the quantity of that portion of the feed that gives the milk the undesirable flavor. Unhealthy, foul stables and surroundings may give a flavor to the milk even before it can be removed from the stable or milking yard. Particular attention should be given, not only while the milk is being drawn, but after it is set, to make sure that it is not exposed to the foul gases from putrefying animal or vegetable matter of any kind, or kept in close, foul quarters. Fresh milk is very susceptible to the presence of such odors and gases, and will readily absorb a sufficient quantity to acquire their odor or flavor. Disease of the liver in which there is reabsorption of the bile into the blood, may give a more or less bitter taste to the milk. In the present case we would advise drying the cow off. Feed more liberally. Give a ration of grain twice daily—to be made up largely of middlings and shipstuffs or bran, with ground oats if convenient, and but little corn—with one-half pint of ground flaxseed or linseed cake. If the cow is to come fresh soon, wait until after calving before giving further treatment. Then if the trouble continues, or if the cow is not with calf, give three-fourths of a pound each of Epsom salts and common salt with one ounce of ginger, as a drench dissolved in warm water. After the bowels have moved, give the cow, twice daily, in the feed two heaping tablespoonfuls of the following powders: Sulphate of soda and powdered gentian root each two pounds, niter one pound.

COLT CUT ON WIRE FENCE.

G. C., Summit, Ohio.—My six-months-old colt ran into a wire fence about two weeks ago, and cut off the extensor muscle about six inches above the knee. I dressed the wound, drew the lips together with stitches, bandaged it and put the animal in a sling just so that it could rest on its feet if it chose to do so. But in a few days somehow in struggling, it broke the stitches, and gradually the wound opened until now there is a wide gash between the edges of the skin. The fleshy part underneath has somewhat filled up; but the part of the wound below where the skin was severed, has bulged out so that there is a prominence a thick as the palm of the hand and almost as large, the flesh being apparently healthy. Is it likely that this prominence will, in healing, draw back into the wound and heal without much of a scar, or will it remain as it is? What would have been the best mode of treatment from the beginning, and what from this on? Is the colt likely to be ruined for the road? It could use its leg tolerably well from the beginning. I have used nothing on the wound except water with a little carbolic acid in it. The animal has been healthy and in good condition all the time since it was hurt.

ANSWERED BY DR. F. L. KILBORNE.

We are not surprised that the stitches broke or sloughed out; because in the horse the tendency to suppuration is so strong, especially in extensively ragged wounds or cuts, that it requires a competent veterinary surgeon to successfully stitch and bandage such a wound: and even then it not infrequently sloughs open. The prominence or swelling should mostly disappear as the wound heals; but a scar can be expected. The colt will probably not be seriously injured for the road. Possibly the limb may be slightly stiffened, but if the wound heals properly no permanent injury should result. Your treatment has been good. To remove the unhealthy granulations, or "proud flesh," we would have preferred a stick of lunar caustic—nitrate of silver. Continue the use of carbolic lotion—carbolic acid two to three parts, water 97 parts—very carefully washing out the wound once daily. Then apply the bandage with gentle pressure, not too tightly, and pads if necessary, so as to gradually draw the edges together. Always be sure to keep an opening at the lower part of the wound for the free drainage and discharge of the matter or pus. If the wound becomes unhealthy, and the healing appears to be at a stand-still, apply compound tincture of myrrh and aloes or a five-per-cent solution of the carbolic acid once or twice a week.

DUTIES ON FOREIGN WOOLS.

D. C. M. C., Cumberland, Ohio.—1. What are the tariff charges on the different kinds of wool? 2. What are the penalties for smuggling the different sorts into the United States.

ANS.—1. Wools, hair of the alpaca, goat, and other like animals, and manufactures of.

Unmanufactured:	
Class one, clothing wools—that is to say, merino mestiza, metz, or metis wools, or other wools of merino blood, immediate or remote. Down clothing wools, and wools of like character with any of the preceding, including such as have been heretofore usually imported into the United States from Buenos Ayres, New Zealand, Australia, Cape of Good Hope, Russia, Great Britain, Canada, and elsewhere, and also including all wools not hereinafter described or designated in classes two or three:	
Value 30 cents or less per pound	10 cts. per lb
Value over 30 cents per pound	12 cts. per lb
Washed Wool:	
Value (before washing) 30 cents or less per pound	20 cts. per lb.
Value (before washing) over 30 cents per pound	24 cts. per lb
Scoured Wool:	
Value (before scouring) 30 cents or less per pound	30 cts. per lb.
Value (before scouring) over 30 cents per pound	36 cts. per lb.
Class two, combing wools—that is to say Leicester, Cotswold, Lincolnshire, Down combing wools, Canada long wools, or other like combing wools of English blood, and usually known by the terms herein used, and also all hair of the alpaca, goat, and other like animals:	
Value 30 cents or less per pound	10 cts. per lb
Value over 30 cents per pound	12 cts. per lb.
Class three, carpet wools and all other similar wools, such as Donskoi native South American, Cordova, Valparaiso, native Smyrna, and including all such wools of like character as have been heretofore usually imported into the United States from Turkey, Greece, Egypt, Syria, and elsewhere	
Value 12 cents or less per pound.	2½ cts. per lb.
Value over 12 cents per pound	5 cts. per lb.
Scoured wool, value (before scouring) over 12 cents per pound	15 cts. per lb.

2. The punishment varies in accordance with the character of the offence, and the circumstances under which it was committed. In very bad cases the goods are forfeited, and, in addition, a fine or imprisonment, or both are imposed. In bad cases a forfeiture of the goods usually suffices with sometimes a fine

In light cases, the goods are allowed to pass on payment of the duties due on them, and in very light cases, a compromise is sometimes made with regard to the amount of the duties to be paid.

NAVICULAR DISEASE IN A HORSE.

H. C., Schenevus, N. Y.—My seven-year-old mare, weighing about 950 pounds, has been lame in her left fore leg or foot for nearly two years. She has good feet with the heels well spread, yet she is getting stiff and sore, standing with the affected foot put forward, especially after she has been driven a few miles. I let her stand with her feet in a tub of water every morning, while she is being groomed, and I have also blistered her across the heel once or twice and used Merchant's Gargling Oil, but all to no purpose. What can I do for her?

ANSWERED BY DR. F. L. KILBORNE.

I suspect the mare is suffering from navicular disease. Try the following course of treatment. Your treatment has been rather mild, and I suspect you did not give the mare a long period of rest, without which, treatment would be of little or no benefit.

Remove the shoes, after which shorten the toe and pare the sole to relieve the pressure. Then keep the foot in a warm flaxseed poultice five to eight days, renewing the poultice once daily: when the hoof has been well softened, remove the poultice, and to prevent drying again, keep the whole hoof well coated with an ointment of equal parts of pine tar and vaseline melted together. Now apply a cantharides blister to the front and sides of the pastern, and repeat as soon as the effects of the first blister have nearly passed off. Blister: powdered cantharides two drams, vaseline one ounce, spirits of camphor 10 drops. A rest of two or three months will be necessary, giving only walking exercise at the halter or in a small yard. Continue the use of the hoof-ointment once daily for three or four months, to keep the hoof from drying and contracting. When again put to use on the road, drive carefully for some time to accustom the foot to its work. If the lameness returns repeat the treatment, but try firing in points, instead of blistering.

GRAPES, ETC.

F. W. W., Leominster, Mass.—1. What are the best three kinds of early grapes for Massachusetts? I want those that have been well tested and also some which are new and promising. 2. What are the best three old kinds for late keeping and three of the best new sorts? 3. Where can I get grapevines to the best advantage? 4. What is the best kind of grass on a high, steep bank? 5. What is the best time for cutting cions and grafting cherries, plums and quinces? 6. What is the best grape for wine, or unfermented juice for canning?

ANS.—1. We would suggest Moore's Early, Worden and Concord or Cottage, as likely to fill the bill for the tested sorts, and Eaton, Hayes and Niagara for the new and promising kinds. 2. Wilder, Herbert and Salem for late-keeping old sorts. New sorts, Vergennes, Ulster Prolific, Victoria. 3. Of any honest, reliable grower who knows what good plants are, no matter where he may be located. 4. If a grass is wanted try Quack grass, Blue grass or White Clover. If the object is merely to cover the land with verdure, giving it no care, plant Canary grass or Periwinkle or Running Mrytle. 5. Cut cions in late winter or early spring when not frozen. Graft cherries in February and March if the weather is suitable; plums and quinces later. 6. For Massachusetts Clinton or Ives is probably as good as any.

GRAPES AND WINTER SWEET APPLES.

C. G. S., Astoria, N. J.—1. Which are the best three kinds of grapes—early, medium and late, taking quality, hardiness, etc., into consideration, about Chatham, N. J.? 2. What is the best winter apple for baking purposes?

ANSWERED BY SEC. E. WILLIAMS, OF MONTCLAIR, N. J.

1. The locality mentioned is in this latitude, being a continuation of the same range of mountains, and the soil is of very similar composition, so that the grapes succeeding best here ought, with similar care and treatment, to do well there. I should therefore say, for early, plant Cottage or Worden for black, and Brighton for red; for medium and late, Wilder, Barry, Concord for black; Niagara, white; Lindley, Vergennes, Salem, or Rogers's 32 for red. For very late plant Catawba and Jefferson for red, but they are too uncertain to be at all reliable. Talman or Lady's Sweet might do for a winter sweet apple. The latter was Mr. Downing's favorite; but I have had little experience with winter sweet apples aside from the Canfield, the universal winter sweet apple for all this region. Talman Sweet, as grown by a neighbor, is affected with hard spots or knots in the flesh.

GRAPE CUTTINGS.

A. M. Alexandria, Ohio.—When is the right time to make grape cuttings? When should they be planted, and how should they be kept through the winter? How late can they be planted in spring?

ANS.—Cut the vines at *once*. If the soil is still open, plant them in the soil at a slight angle, so that the upper bud just reaches the top soil. Then cover with any protecting material. They may also be planted in tubs or boxes—the boxes placed in the cellar until spring. Then the cuttings may be left to sprout *in* the box or tub, or planted in the open ground. This tub method is an excellent way of sprouting grape-vine cuttings. In the spring the cuttings should be planted before the buds push.

Miscellaneous

J. L. C. Botetourt, Va.—What commission houses in New York city handle veal calves?

ANS.—Hallenbeck & Hollis, and Everett & Pidcock, of this city, handle lots of calves.

F. G. G., New Britain, Conn.—1. What is the name of Rogers's No. 30 grape? 2. Does it benefit a grape-vine to bury the prunings of ripened wood in the bed?

ANS.—1. No. 30 has never been named. 2. We don't understand the question.

H. S., Edgerton, Kans.—1. What is considered the best special dairy paper? 2. Who are reliable breeders of pure-bred Jerseys?

ANS.—1. Hoard's Dairyman, Fort Atkinson, Wis. 2. Miller & Sibley, Franklin, Pa.; Smith Bros., Eagle, Mich.: R. A. Mayhall, New Maysville, Ind.; D. H. & S. S Tripp, Peoria, Ill., and T. L. Hacker, Madison, Wis

F. O. C., Washington, Kans.—I send the RURAL some specimens of grape-vines infested with insect eggs. To what insect do they belong, and what is the remedy?

ANS.—The canes are infested with the eggs of the tree cricket (so-called), Œcanthus niveus. They are usually deposited in the canes of the raspberry. The remedy is to cut out late in the fall or early spring all those portions of the cane which contain eggs, and burn them.

DISCUSSION.

TRAIN UP A CHILD.

"READER."—In reading Oliver Howard's "How John Became a Market Gardener," my attention was specially drawn to his suggestions as to the manner in which children may be encouraged to take an interest in their parents' business, and I thought my experience upon the other side when a boy, might not prove uninteresting, and that it might even contain a moral for some of those parents who are endeavoring to interest their children in the details of their business, hoping that their sons may follow in their footsteps. I am one of a family of several children and have one brother two years older than myself. My father was a farmer in fair circumstances and my first recollection is of a farm in Illinois. As soon as a child reached the age when his strength became valuable, he was at once placed where it would contribute towards acquiring the "almighty dollar". My father was quite close in money matters and seldom or never gave his sons a cent, but by the time I had reached the age of 10 and my brother 12 years, we had accumulated a small sum. Not one cent of this had been contributed by our father, but it had been honestly earned of others by our own labor. For instance, if a neighbor wished to go on a visit he gave us a dime or a quarter for feeding his stock during his absence. We had also built the fires and swept the floor of the district school during the winter term, which was all the schooling we received. But we had accumulated the (to us) magnificent sum of three dollars. Our father suggested that, as we had become capitalists, we should invest our money in something which would bring us a fair profit, and proposed that he should take the money, giving us in exchange two young suckling pigs. They were not worth a dollar apiece, but we knew thrifty pigs had a habit of growing and we gladly consented. The pigs were chosen and marked by a slight nick in the ears. The money was handed over and proudly we assumed undisputed ownership of two infant porkers. We gave the drove the best of care and rejoiced to see the confirmation of our youthful judgment in that the chosen ones were better than the average. The pigs became shoats and the shoats became hogs. We had seen hogs weighed and knew that ours would now weigh more than 300 pounds each. The price of pork rose to $6 per hundred. Our hogs would bring almost $40. Did the bank of England contain more money? Our enthusiasm rose to the highest pitch and we proudly planned how we would invest our money in a span of young colts. The buyer came. Our hogs were sold by our father along with the rest of the drove. As he pocketed the money we meekly suggested to him that two of the hogs were our property and that we should receive the proceeds. He answered, "You have no use for money while I have many uses. I shall keep the money, but you may go to the herd and each choose a steer calf which you may have for your own."

Knowing it was "Hobson's choice" we reluctantly consented. We chose our steers which were about six months old. We made a small yoke and taught them to lead and drive. We did not expect to work them, for our ambition rose above oxen. The purchase of the colts was delayed, but the idea of it was not abandoned. We gave the herd every attention that our own might receive a corresponding benefit, and they responded nobly to our efforts. They grew as had the hogs before them. Again the buyers came. Our steers were sold among others. As our father complacently pocketed a goodly sum we demanded our own. It was refused. A mild rebellion followed, but it was promptly quelled by the head of the firm who informed us that he owned both ourselves and our earnings until we reached the age of 21. The law gave him that right, and until that time he proposed to exercise all the authority which the law gave him. And so the matter ended. Our "castles" vanished along with the original investment. The colts were beyond the horizon. From that time until I left home, which I did at the age of 18, I never presumed to call anything my own. Since then by my own exertion I have acquired a fair share of this world's goods. I have also met many losses and disappointments, broken promises and betrayals of confidence; but none was as keenly felt or as bitterly mourned as my first attempt at acquiring property, and my father's desire to interest me in his business.

START THE PIGS RIGHT.

A. M. CROSBY, CATONSVILLE, MD.—Under this heading in the Dec. 22 issue of the RURAL, Mr. George Q. Dow gives some very excellent advice, and some that is rather "too excellent." One would be apt to think that if it were necessary to take so much trouble, pigs, most certainly would not pay.

It is stated, in the first place, that pigs should not be bred before they are a year old. I have now two sows, one of which was bred when 10 months old, and the other when nine, and again when 15. Both raised fair pigs and are in good condition. A neighbor of mine breeds sows when they are even younger. If spring pigs are not bred until they are a year old, one will either have as a result fall pigs, or else he will have to keep his sows two years before they begin to declare dividends. Mr. Dow says that a pig is a very intelligent animal, and then goes on to say that a sow hasn't sense enough to take care of her own offspring when they arrive. His pigs must be constructed rather differently from those around here. I have never had more than one case where interference was necessary; and then the fault was due entirely to myself. I left the sows out all winter and fed them exclusively on corn, and even in that case only one sow out of nine showed any inclination to eat her pigs. If a sow has been treated properly, fed the right kind of foods, given a warm, dry bed by herself, there is not one case in 20 where she will need watching, or would be benefited by interference. This I know from the experience of my neighbors and from the records of the pigs I have raised. Mr. Dow further states that the period of gestation "may be timed to a day, and reckoned almost to the hour," and that farrowing usually takes place after eating. Well, if Mr. Dow knows that his litter of pigs will arrive at 10 minutes after supper-time, why does he sit up through the long winter night? Referring to my record of pigs bred, I find the periods of gestation as follows:

2 sows	111 days
1 sow	112 "
4 sows	114 "
1 sow	115 "
1 sow	118 "

Here is a variation of seven days, or 168 hours. I don't know what sort of a climate Mr. Dow has, but in this latitude where the mercury occasionally drops to 10° Fahr. warming spring pigs is unnecessary, if the sow and her surroundings are in good condition. And if food and affection arrive at the same time, I think we also may safely include pigs in the list. The old sow probably has as much affection as she has pigs, but being in great pain, she does not ordinarily show it. Luck is certainly not a good factor in raising pigs, but an ounce of careful attention before farrowing will save many a pound after.

"WITCHING" FOR WATER.

T. H. T., ALEXANDRIA, DAKOTA—What do all the good and wise men who read the R. N.-Y. know about witching for water? There seems to be just enough of mystery about it to make it interesting, and enough of reality to make it worthy of study. Can't we have some reports for and against? Here's mine. My friend bought a farm which had been bored, drilled and dug in all likely and unlikely places for water, without finding the "liquid staff of life." As a last hope, he sent for a water "witch," or wizard who held an ordinary bullet about four inches from the ground, suspended by a string about eight inches long. He did this at various places, until he found a place where the bullet swung like the pendulum of a clock. Said he, "Here you will find that water," and there my friend dug a well, and at 56 feet struck the so called "Jasper" rock which runs across these parts and comes out at various places, and is worked at Sioux Falls, but, as he said, "It was as dry as bone dust; but I was desperate, so I went to drilling and blasting" He blasted out 20 inches of rocks and water rushed into his well from the northeast. The "witch" had said "The stream runs to the southeast," which proved to be true. My friend has good water and plenty of it, *except* when the wind blows from the northwest; 12 hours' wind from this quarter will make a very sad and strange shrinkage in the supply.

Now, observe these facts:—My friend finds by actual experiment that he himself is a water "witch," the bullet swinging as violently for him, at right angles with the supposed movement of the water, as it did for the professional; while for the son of my friend, and for me, the bullet will only show a very slight disturbance when held over the supposed stream, and that disturbance is parallel with the water, or at right angles with the bullet's movement when the string is held by either of the men. What is it? Who can tell?

JAPANESE BUCKWHEAT ONCE MORE.

H. T. L., BRIGHTON, CAN.—On page 748 P. S. B. wants to know the experience of others with "Japanese buckwheat." Two years ago I purchased one pound of this variety, costing 53 cents. It was sown 10 days later than our common kind and was hurt by the sun and drought immediately after sowing, so that it could not yield its full capacity, although I harvested about half a bushel.

This was sown again this season, but the sheep stole into the patch when the crop was about four inches high and destroyed most of it, so I cannot tell what it would have yielded had it not met with such misfortune, but it is certainly the buckwheat for this country. It is about 10 days earlier than our common kind and will stand more drought and is less liable to be injured by the sun. The straw is more juicy, and, therefore, takes longer to cure; but if buckwheat straw is good for stock at all, this is certainly relished more by animals.

I have the same opinion of buckwheat straw as H. T. (page 816)—that it is better for beds than feed. From the pound I purchased two years ago I have now five bushels.

FLOURING QUALITY OF JAPANESE BUCKWHEAT.

E. G. S., CUBA, N. Y.—Having seen much said about Japanese buckwheat, and having noted several inquiries as to its flouring qualities, I venture to send the following statement made by the miller at Nile, N. Y.

"This is to certify that I have ground two bushels of the Japanese buckwheat raised by E. G, Stone, and it was fully up to the yield of other buckwheats, and I think it will excel all others as to quality." L. BURDICK.

J. H. L., COXSACKIE, N. Y.—Fred. Grundy's article on page 831 of R. N.-Y., wherein he says that "practical, common-sense management will get into the poultry yard after awhile" is good; but when he calls it all "fol-de-rol" about hens having pebbles, meat, etc., and then says that his hens get none of these things; but just "pick over the ashes from the stove" and get the "parings and scraps from the kitchen table," it reminds me of one of my neighbors who says that he does not care for any meat for breakfast if he has plenty of ham and eggs.

I. J. B., TITUSVILLE, N. J.—S. E. H., in a late RURAL, is about right on the La Bastie lamp chimney. Such articles seldom break, although they will break sometimes even with apparently fair usage. I have some that have been used three years.

What Others Say

THE ONTARIO CHEESE TRADE.—The growth of the Ontario cheese trade within a few years is said by the Toronto Globe to have been wonderful. "The exports of the Dominion now amount in value to over $7,000,000, and the season just closed shows the largest business on record. The shipments from Montreal this season were 1,134,349 boxes, as against 1,104,065 boxes last year, 507,019 boxes in 1880 and 359,251 boxes in 1874. Of this season's exports 499,391 boxes went to Liverpool, 140,394 boxes to Glasgow, 235,176 boxes to London and 259 388 to Bristol. In striking contrast to this statement is our foreign trade in butter. The exports this season were only 46,528 packages, as against 60,353 packages last year, 194,366 packages in 1880 and 80,206 packages in 1874. Of this year's shipments some 26,014 packages went to Bristol, and 20,253 packages to Liverpool."

FULL AS A TICK.

IT is rather remarkable that of the many experiments tried by the stations in order to show what quantity of seed-oats will give the largest yields, not one gives anything but contradictory results. Experiments of this kind made at the R. N.-Y. Farm 10 years ago were not contradictory. One and a quarter bushel was the amount which gave the heaviest yield. In a bulletin just received from the University of Illinois E. S, one bushel of seed gave 52 bushels of crop; two bushels gave 61; three bushels gave 62; four bushels gave 61.

ANOTHER experiment was made to find out which would give the greater yield of oats, a compact or a loose seed bed. Of the three plots, all fall-plowed, the oats on the first were lightly covered with a disc harrow and rolled with a heavy roller. No. 2 was cultivated with a disc harrow before sowing; the oats were covered by disking once and once harrowing. No. 3 was disked three times before sowing, once afterward and then harrowed. The yield was as follows:

No 1 (compact),	60	bus.	per	acre.
" 2 (medium loose),	66	"	"	"
" 3 (very loose),	61	"	"	"

A THIRD experiment was made to determine the best time for sowing, with the following results:

April	6	yield	66 bus.
"	13	"	57 "
"	20	"	49 "
"	27	"	49 "

OATS were sown from one to six inches in depth. The largest yield was from the seed covered three inches: the next from that covered four inches, the next from that covered one inch. Of course nothing is taught by this trial.

HERE is an item which is being published in many of our farm papers.

"THE editor of the Mark Lane Express (London), advises farmers to cut off potato blossoms as soon as they appear. The balls, or true seed of the potato, which results from the blossom, are not only unnecessary to the formation of the tuber below, but are a prejudicial strain on the plant.

THE R. N.-Y. has raised as many as 100 different varieties of potatoes in a single season without being able to find a single seed-ball. Labor spent in cutting off the flowers would be thrown away. In fact the varieties of potatoes of to-day fruit very sparingly in this country. If some of our agricultural editors could be induced to visit a potato patch once in awhile, they would find this out.....

How should horticultural meetings be managed is a question which Green's Fruit-Grower asks. John J. Thomas says that they are made successful only by much labor. They will not run of themselves. The managing officers must be willing to employ much correspondence and as much personal effort and interviewing as practicable before the time of meeting. Write to or converse with those who have been successful or who have *made money* by raising and selling fruits; give their experience. The prospect of learning how to *realize profits* will have a *special charm* to most men .....

In the planting of a tree, says C. W. Garfield, all the family may take a part, and as it grows thereafter, we find that that tree is a part of the family as much as each child, and about it the tissues of the home concentrate and hold them all together, and by and by they look upon that tree as one of the influences that have lifted them to a higher plane of living .....

L. B. PIERCE, of Ohio, very sensibly fears that horticultural societies are liable to degenerate into banqueting associations, coming together for an orgie instead of intellectual entertainment. He says that long records of the weather, of cold snaps and periods of drought, generally known as *ad interim* reports, are of little value. The world is too busy to read weather reports 18 or 20 months old .....

MR. PIERCE makes the statement that more than one-half the farmers in Ohio do not raise enough strawberries, currants, pears and cherries for home use, and not one in ten grows a decent supply of strawberries and blackberries .....

IT seems to him that it should be the work of the horticulturist, not only to enlarge the consumption of fruits, but to teach thousands who know them not, the joys that come with their growing .....

MR. E. C. DAVIS, of Northampton, the winner of the $25 prize offered by C. A. Green for the largest crop of the Jessie strawberry raised on a given area, reports 41 ¾ pounds of berries from 12 plants—which seems close to incredible to the R. N.-Y.

To quote his words: "It is simply wonderful and beats everything I have ever seen or dreamed of among stawberries. If there is any defect about it I have yet to discover it."

THUS we see how a kind of fruit thrives in perfection in one locality and fails in another. The Jessie as yet has not shown any decided superiority over older kinds at the Rural Grounds.....

Mr. Davis never sets out plants of any kind without thoroughly preparing the soil for them, and with strawberries he works into the ground all it will hold of old, well rotted cow manure. Then he makes the ground as mellow and fine as possible.

Then, after culture, feeding and watering are what tell on strawberries, particularly between the time of blooming and the ripe fruit. He treats his strawberry plants in this respect as he does his poultry and horses, feeding and watering them every day, the feeding being largely with fertilizers, although he uses wood ashes and bone meal freely. Then he finds they can hardly be mulched too much, and especially is this true of light, thin land, where the mulch retains the moisture. The strawberry plant delights in two baths every day, one of water and the other of the sun .....

THE Chattanooga Tradesman says that the assessments of property in the 12 Southern States amounts to $3,681,740,945. The increase in population in these States since 1880 has been 5,500,000.....

A FRENCH writer says that in Paris the municipal chemists accept milk as pure when it contains one ounce of butter and four ounces of solids per quart. At Berne, milk must contain at least three per cent of butter, and may contain 90 per cent, of water. At Berlin, the police seize all milk offered for sale which is below the legally required standard 2.7 per cent of fatty matters.

THE Western Druggist gives a formula for a liniment much used for cuts in live stock from barbed wire. For healing cuts and flesh-wounds of all kinds it has no equal, and flies will not trouble a sore where it is used. Raw linseed oil, 16 ounces; saltpeter, powdered, 1 ounce; sugar of lead, powdered, 1 ounce; sulphuric acid, 1 ounce; carbolic acid, ½ ounce. Mix the oil with the saltpeter and sugar of lead, and slowly add sulphuric acid, stirring constantly. When cold pour off from the dregs and add the carbolic acid. Apply with a feather twice daily. Do not wash the sore at all. Keep a supply constantly on hand to be ready for casualties.....

IN order to more exactly determine the effects of inoculation against pleuro-pneumonia as we learn from the London Agricultural Gazette, extensive experiments have been arranged by the Saxony Agricultural Society, which are supported by the Government. Sixteen heifers, from various parts of the country absolutely free from pleuro-pneumonia, have been collected, inoculated in three different parts of the body, the wounds being treated antiseptically, and the animals have now been sent to a farm where pleuro is reigning extensively, being mixed with the diseased cattle. The experiments are conducted by Prof. Dr. SCHUTZ.....

IF we look at the composition of roots and straw, says Sir J. B. Lawes, we see that their properties are totally distinct and opposed to each other. In the roots, we find an immense quantity of water, varying from 88 to 92 per cent, and it is very remarkable that this water is so intimately combined with the solid matter of the root that even when cut up into small pieces no water runs from it; milk, which is perfectly fluid, contains less water than the solid root; the solid matter of the root is chiefly sugar, and what is not sugar is almost entirely digestible. Straw, on the other hand, is hard and dry, and the digestible matter is largely mixed with substances which are not digestible; the two foods when used together correct each other's defects. To squander the fertility of your soil in useless vegetation is bad enough, but to feed thistles and Couch grass with nitric acid worth 15 cents per pound is wasteful extravagance .....

LOOK to the potatoes to be used for seed next spring. Remember that every sprout weakens the potato and that every seed piece of this kind *cannot* sprout in the field as vigorously as one that is sound.....

THE R. N.-Y has its heart in fruit culture. What other paper has done more for pomology?.....

GRAFT GRAPE-vines during February if the ground is open, or in March or later so long as the sap does not flow.....

DIRECT.

——"WHEN a man farms in a certain way and then charges his failures on the business instead of on his way of conducting it, he makes a great mistake."

——W. B. ALWOOD of the Va. E. S. "The Women's Potato Contest is a grand move."

——T. B. TERRY: "When using the Cutaway harrow, always lap half. You thus harrow all the ground twice, once each way, and leave it nearly level."

——N. E. HOMESTEAD: "No higher compliment could be paid farmers than the words of Prof. S. W. Johnson, Director of the Connecticut experiment station. 'I am astonished,' he said 'in looking over some of the agricultural papers, to see the character of matter they print, that their subscribers read and digest. But a few years ago all this would have been as unintelligible as Greek is to most men. The scientific feeding of cattle, the chemical constituents of the soil, and the practical discussion in print of kindred matters show how deeply farmers are thinking. No people under heaven can show such progress in 25 years. I say this not to brag, but for sober encouragement."

——LONDON AGRICULTURAL GAZETTE: "In these days, green manuring is seldom attempted, simply because after having grown your crop it is too valuable as sheep food to be plowed in. * * * We are told that wheat never looked better than it does now." . . . .

——COR. N. Y. TRIBUNE: "When you put a kerosene lamp in your cellar to warm it set a joint of stovepipe over it and lay a tin plate or the like over the upper end, taking care not to have it tight enough to interfere with the draught. The pipe will be hot as long as the lamp burns, radiating the heat in all directions, while an open lamp merely sends a hot current upward, leaving the bottom of the cellar as cold as ever. * * * * "There is danger in selecting too many varieties of summer apples: better have several on one tree for testing."

——PUCK:

"BUSINESS IS BUSINESS.

"AMERICAN MILLIONIARE (year 1988).—What are the prices of admission?"

"DOORKEEPER (United States Capitol).—Seats in the Senate are five hundred thousand dollars; but I can give you a seat in the House for one hundred thousand dollars. Thanks. Hand this ticket to the usher. Keep the coupon in your hat to avoid mistakes."

Miscellaneous Advertising.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds, it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

SOLID COMFORT

TONGUELESS. THE "WONDER ON WHEELS"

Self Guiding. Uses a wheel landside. Two horses instead of three. A ten year old boy instead of a plowman. No pole (except among stumps). No side draft. No neck weight. No lifting at corners. Easier driving, straighter furrows, and LIGHTER DRAFT THAN ANY PLOW on or off wheels. Will plow any ground a mower can cut over. No equal in hard, stony ground, or on hillsides. Our book, "FUN ON THE FARM," sent Free to all who mention this paper.

ECONOMIST PLOW CO. SOUTH BEND INDIANA.

Special prices and time for trial given on first orders from points where we have no agents.

NEW YORK STATE AGRICULTURAL SOCIETY.

ANNUAL MEETING.

The Annual Meeting of the New York State Agricultural Society will be held at the Society's rooms, Albany, on WEDNESDAY, the 16th day of January, 1889, at noon.

W. JUDSON SMITH, Secretary Pro-tem.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JANUARY 12, 1889.

FROM THE LIEUT. GOVERNOR.

BINGHAMTON, N. Y., Dec. 29, 1888.

Editor Rural New-Yorker: THE RURAL NEW-YORKER of December 29 is before me, and its effect on me is to impel me to express to you my sincere wishes for a Happy New Year for yourself, and continued success for the RURAL, which, when contrasted with the agricultural papers of 25 years since, shows not only the improvement in the paper itself, but also illustrates the progress made by the agricultural class, much of which *is due to the inspiration of the* RURAL NEW-YORKER, *and such of its contemporaries as follow its example.* EDWARD F. JONES.

"But who would buy these vegetables if you had them to sell? Every mechanic and merchant in your village and even your next-door farmer-neighbor. You needn't shake your head and say you know differently—that I "don't know the kind of folk in these parts." We all know that supply creates demand. If these vegetables are not presented to your people, can you expect them to run around looking for them? No, for they won't do it."—WM. FALCONER, page 20.

"BUT, taking the year together, my dear, there isn't more cloud than sun."

THE RURAL NEW-YORKER for 1889, will be, as hitherto, invariably, $2.00 a year for single subscriptions, and $1.50 in clubs of five or more.

THE best kinds of vegetables, roots, potatoes, etc., for both the garden and field; the best of the old kinds, the best of the new. These topics will be fully treated by practical writers in a few weeks.

THE three bunches of Niagara grapes, received from Secretary Williams, September 29, and illustrated in Fig. 5, weighed about three pounds. Some of his clusters weighed a pound and a quarter. The illustration is precisely life size.

"THE success of the 'Potato Contest' of our friends of the THE RURAL NEW-YORKER, has stimulated several publishers and manufacturers to the offering of large money prizes for crops to be raised during the coming year." So says the Editor of the American Garden.

MR. C. W. MINOTT, the Horticulturist of the Vermont Agricultural Experiment Station, writes us, under date of December 26, as follows:

"The R. N.-Y. potato No. 2, I think, is bound to come to the front. It fulfills all that is claimed for it. It nearly leads the 80 varieties tested here this season in merchantable tubers."

THE 1889 catalogues are now being sent out by the seedsmen and nurserymen of the country. We shall soon begin to review these catalogues, calling special attention to the new and old things of merit and demerit, which it might be well to try or to leave untried. The R. N.-Y. always endeavors to be strictly impartial in its catalogue reviews.

SUCH of our readers as make butter will confer a favor upon us by ascertaining how many pounds of milk are required to make a pound of butter. We are gathering statistics regarding dairy profits, and want as many figures as we can get. Our readers will have all the benefit of our investigations. The greater the number of accurate statements, the more valuable the conclusions. We want the milk weighed as it is put into the pans, the cream weighed as it goes into the churn, and the butter weighed as it is sold or used. Then we would like to know the breed of cows, the feed, and any other information that is easily obtainable. Who will help in this matter?

FOR the past 10 years, in a general way, but for the past four years especially, we have had occasion to observe that the subscribers of the R. N.-Y. are, more and more with each succeeding year, of the more intelligent, progressive, alert, well-to-do class. This is as it should be. It is what we have worked for. It is in accordance with the old and forcible maxim that "birds of a feather flock together." We want all the subscribers we can get. That, as they say, "goes without saying." It is not for the R. N.-Y. to select its clientage, any more than it is for a merchant, doctor, lawyer or minister. Nevertheless, it is gratifying, all the same, to find that we are supported by good, intelligent people. The R. N.-Y. some years ago found out that purchased subscribers, how much soever they may swell the subscription list for the time, are not worth having.

THE Southern Cotton Oil Company, the great hopeful rival of the Cotton Oil Trust monopoly, has been doing a fair business during the season, and, the other day, at the end of its first half year's business, decreed a dividend of four per cent., payable February 1. This is said to represent less than half its earnings, the rest being reserved for expenses in increasing its plant and machinery. While the oil-producing quality of cotton seed this year has not been equal to that of last year, the higher prices that have been obtained for the product have made better returns and enabled the company to pay better prices to the planters. Owing to the competition between the rival organizations in some places and to the refusal of the planters to sell their seed at unremunerative figures in others, higher prices than usual have been obtained by growers for their seed during the past season. Southern farmers have shown a good deal of spirit and sense during the past year in refusing to sell their seed at unreasonable prices, as well as to buy jute bagging at extortionate figures.

THE Hon. Columbus Delano, of Ohio, President of the National Wool Growers' Association, has called a meeting of the officers of the National and State Associations at Washington on January 10. In his address he says that "the schedule pending before the Senate fails to afford adequate protection to the wool-growing industry." He thinks the provisions relating to carpet wools will lead to large importations of wool used for clothing purposes at a duty of only 2½ cents per pound. He points out that it contains no provisions preventing the present large importations of scoured wools at the low duty imposed upon washed wools; and he thinks these and other defects endanger the prosperity of the wool industry, unless they are remedied before the bill is passed. At present wool is in good demand at an average of three cents per pound higher than it was a year ago; but at an average of one cent per pound lower than it was at the corresponding date in 1886. The stocks on hand at Boston, the great wool market of the country, are about 40 per cent. lower than a year ago, and at Philadelphia, our second greatest wool market, they are estimated to be at least 50 per cent. lower, while at other points they are unusually small also. At all Eastern markets receipts are very light and there is no anxiety to sell except at top figures, while the tendency of prices is decidedly upward. Some large manufacturers have considerable stocks on hand; but small mill owners are not provided with much for future consumption. The news from abroad continues quite favorable, and with the confidence arising from the knowledge that no decrease will be made in the tariff for at least the next half dozen years, the outlook for sheep husbandry is very encouraging.

SPECIAL NUMBERS.

EVERY issue of the R. N.-Y. for 1889 will contain an elaborate discussion of some timely and important subject. We find that this idea of grouping the opinions of various authorities in one issue is very popular and convenient. Some of the best of these discussions are frequently started by suggestions made by readers, who, in course of their studies, come across points that are not clear to them. We always take pleasure in collecting all the information we can, that will benefit our readers. While our readers may expect 52 special discussions for 1889, there are several topics that we deem of sufficient importance to warrant us in giving extra attention to them.

Farm Help.—If we may judge from the deep interest evinced in the replies to our inquiries, the question of farm labor and laborers is of the utmost importance.

We shall give the most reliable information obtained from the various sections of the United States.

Seed and Seedsmen.—In this Special Number some of our best market gardeners and farmers will give lists of the seeds they find most profitable for field and garden culture, with very reliable information regarding culture, etc. "To what extent should seedsmen be held responsible for their seeds?" This question will be discussed fairly and intelligently in this number.

Manures.—We shall issue our usual Fertilizer Special in which a number of exceedingly interesting topics will be discussed. In short, the R. N.-Y. will do its best to collect the most reliable information regarding any agricultural proposition discussed.

TAXES ON MORTGAGES.

IN several of the States if a farm worth $5,000 is mortgaged for that sum, the mortgagor is taxed as if he owed nothing, and the mortgagee as if he had created property to the extent of the incumbrance; in other words, $5,000 being taxed twice, is taxed as if it were $10,000. To avoid such double taxation borrowers frequently give deeds for the land in common form, taking bonds for reconveyance when the money is repaid with interest; but this is a perilous practice. The creditors of the lender may attach the property and hold it as his, for it stands in his name; the creditors of the borrower may attach it and hold it as his, for the bond to reconvey is a secret trust, and in law a fraud upon them, unless it is recorded with the deed, in which case the two instruments constitute a mortgage; and, finally, in some States at least, the tax collector, if he can learn the facts, may treat the transaction as a mortgage, and collect from both parties.

In some other States the tax on mortgages is smaller, and few resort to such dangerous expedients to avoid it. In all cases, doubtless, the reason for the original imposition of this burden was the supposition that it would operate as a tax on capital. Even if such were the case, it is questionable whether such legislation would be best for the people at large. As a matter of the plainest fact, however, it is always and inevitably a tax on the borrower and not on the lender; for in all cases the latter, in addition to the interest he would otherwise charge, exacts enough to cover the tax he has to pay on the mortgage. Moreover, such a tax always operates as an unjust discrimination against the capital of the State in which the mortgage lies in favor of outside capital.

Some of the States in which mortgages are taxed, having realized the evils of the system, are agitating for the repeal of the laws. Of these Minnesota is probably a fair example. There the tax on mortgages is two per cent. The financial standing of the State is so high and the reputation of her citizens so excellent that, on good security, they ought to be able to obtain money readily at six per cent; whereas the current rate of interest is eight per cent. The difference is due entirely to the tax on mortgages. The man who makes the loan knows that he must pay two per cent on it to the State, and, intending to realize six per cent on his investment, he charges eight per cent, to cover interest on the loan and the tax on the mortgage in addition. Then there arises an unjust discrimination. If the lender is a citizen of Minnesota, he is subject to her law, and must pay the tax. If he is a citizen of some other State, he is beyond her jurisdiction, and the tax on the mortgage cannot be collected within her borders. The result of this is to keep the rate of interest in Minnesota artificially high. Citizens of a few other States holding Western mortgages are taxed on them in their own States, and must therefore add this tax to the amount of interest they exact. Even where this is not the case, capital invariably charges the rate of interest current in any community; and the Eastern capitalist who has to pay no interest at home on his Western mortgages, will always charge eight per cent. in Minnesota, because the home-lender must do so to cover the two per cent. he has to pay to the State on his mortgage. The net result of the tax, therefore, is to raise the rate of interest over the whole State by two per cent, and this enormous tax is wholly borne by the unfortunate debtor class—chiefly farmers. Taxation of mortgages is always a harmful and iniquitous policy, because it inevitably adds to the burden of those already grieviously oppressed, and all legislation sanctioning it should be speedily repealed in every State in the Union.

BREVITIES.

THE R. N.-Y.'s best admonition to its readers for the New-Year: "Love ye one another."

NOW is the time to begin to handle over your seed potatoes. Read what was said about this last year.

THE city supplies the country with eggs just now. Where does the blame rest—with the hen or the hen owner?

THE KIEFFER PEAR is a prince in quality compared to the large and beautiful California Clairgeaus now in the market.

A WRITER in "Postscripts" gives an original plan for interesting children in the literature of agriculture; why not try this?

MANY ladies who have entered for the "Potato Contest" write to the effect that they want to do all the work themselves except the plowing and cultivating.

THE Bubach strawberry is worthy of a trial. It succeeds well at the Rural Grounds, and favorable reports come to us regarding it from many parts of the country.

THE Niagara grape—outside of the Niagara nursery—was first fruited at the Rural Farm, Queens Co., L. I. It thrives well there, but at the Rural Grounds, Bergen Co., N. J., it rots badly in moist seasons.

In our issue of Sept. 15th, page 615, under head of "Latest and Briefest" we said: "Ammoniated bone, made by J. B. Eckerson, River Vale, N. J.; selling price $38; station valuation $27.20" —We should have said *sampled* by J. B. Eckerson.

ONE of our leading agricultural writers suggests Prof. J. L. Budd, of the Iowa Agricultural College, for our next Commissioner of Agriculture. "I believe," he says, "that for enterprise we have no better man." And the R. N.-Y. believes precisely the same thing.

THE hogs that work over the manure in New England barn cellars have done a good work for agriculture. They have not made the best of pork though. The best of pork can be made only by animals which make a business of pork-making, and do not have to act as manure-mixers as a side issue.

THE Pennsylvania Patrons of Husbandry advocate the preparation of petitions to be presented to the Legislature providing for a bounty of two and a half cents per head for the destruction of that "intolerable nuisance," the English sparrow. Similar petitions asking for a bounty of two cents per head have been circulated in New York State, and measures looking to the extermination of the pests have also been advocated in a large number of other States; but while the farmers are talking, the friendless little vagabonds are multiplying and spreading abroad prodigiously rendering their destruction next to an impossibility, while becoming all the more desirable. This pugnacious and impudent little robber is among birds what weeds are among plants.

THERE is a tariff of $20 a head on imported horses and mules, and at first glance this certainly appears equitable in view of the usual cost of such animals and the tariff on manufactured products. Moreover, it is easy to count off imported beasts and levy the tax, and there is no danger of under-valuation. In a debate on the matter in the Senate the other day, however, a Texas Senator stated that many horses and mules imported from Mexico are valued at only $10 apiece, although they answer all intended requirements. A tariff of $10 on such an animal would be equal to 200 per cent., while on a Canadian truck horse worth $100, it would be only 20 per cent., and on a $2,000 imported Thoroughbred, only one per cent. In such cases a specific duty of $10 per head would tax the Texas planter 200, the Vermont farmer 20, and the "dude" horseman only one per cent. Surely there are some puzzling problems in the tariff question.

THE famous Legion of Honor was founded by Napoleon Bonaparte when First Consul of France, for merit both military and civil. To obtain the insignia of the Order is one of the highest ambitions of a Frenchman, and is a mark of signal honor for a foreigner. The number of such decorations bestowed on the latter class, in all parts of the world, is small, hence the greater the distinction for the fortunate few. On the first of each new year, the head of the nation, whether Emperor, King or President, confers the honor of the Order on those natives or foreigners whose merits are considered worthy of the favor. The only foreigners who were thus decorated by President Carnot on last New Year's Day were two Americans, one an occasional, and the other a frequent contributor to the RURAL—F. L. Scribner, Mycologist of the Department of Agriculture, and T. V. Munson, vine originator of Texas. In both cases, wasn't the honor worthily bestowed?

Postscripts.

SHORT, SHARP AND SENSIBLE.

"I find the nicest way to prepare ground for an orchard, is to plow it in the fall in lands, the dead furrow coming just where the row of trees is wanted. Go an extra round in each dead furrow, deepening it as much as possible. The winter's frosts and rains will mellow the soil and subsoil finely. Then in the spring harrow thoroughly and plow the earth back, making a back furrow in the dead furrow. Harrowing again leaves a mellow plant-bed of fine soil knee-deep. One does not have to dig a hole for the trees, but simply to throw out a few shovelfuls of dirt. I set out 600 two-year-old apple trees in three days all alone. Many of the trees were set by pushing the shovel down its full depth, pushing it forward a little, and putting in the tree, and dropping the earth back and treading it down firmly. The trees all lived and grew well." W. B. H., Como, Montana.——"Here is a suggestion for those who wish to give their children an interest in agriculture: Take the RURAL as it comes to hand, look for the author of the most interesting thing in it, tell the children the person's name and residence and let them look the latter up on the map—an advanced school geography will do. See what can be found out about the climate and natural resources of the place and the principal farm products of that region, and compare them with those of your own locality. Then tell them what you know about the author and what are the branches about which he or she writes, how he works his farm and your opinion of his writings and farm practice. Also compare what he says with what any other writer on the same subject teaches. Thus you will give your children a practical knowledge of the more prominent agriculturists in all parts of the country, which will be of at least as much use to them, if they are to be farmers, as will the knowledge of famous generals, politicians and lawyers, usually found in children's books and papers." F. W. H., Warren, Me.——"One year ago last spring I planted the Pond corn sent out by the RURAL. I was so well pleased with it that last season I planted the whole crop, about one and one-half acre, and from this I had as fine a prospect for a good yield of corn as I ever had in my life. But on the nights of Sept. 6 and 7, frost came and blasted my hopes and my corn. I have no seed now, and want one-half bushel. One year ago last fall, I sowed a bushel of the Thousandfold rye on one-half acre. Last fall I thrashed 22 bushels of as nice rye as ever was raised here. Last fall I sowed two bushels on one acre; the stand looks nice now. I obtained my seed from a small paper sent by the RURAL." C. M. L., Centre Lisle, N. Y.——"I cannot farm without the splendid old RURAL. It has improved with every year and month during which I have taken it. I used to think that its price ($2.00) was pretty steep; but now I regard it as the *cheapest* as well as the best, and would do so even if the price were raised to $3. The special topics are most ably conducted. The cartoons are most excellently printed, and for originality, truthfulness and vividness, its teaching cannot be surpassed." F. S. G., Phœnix, Arizona——"It is evident that the unprecedented loss of poultry caused by the prevalence of cholera will affect the poultry and egg market in the near future. In the portions of Long Island devoted chiefly to raising broilers for the early market, the death rate from cholera has been enormous. It is not only the actual loss of the fowls that is deplorable, but the discouragement which it brings to poultry raisers, many of whom have already decided to go out of the business." H. L. J., Suffolk Co., N. Y.——"Potatoes are one of our staple products here, and I am greatly interested in the RURAL'S trench system. I intend to get my neighbors interested by inducing them to subscribe for the RURAL. The trench system has not been tried here yet, but it will be next season on this farm if my health is spared. The RURAL is the only paper every word of which I read clear through, and we take about half a dozen papers, all of them good ones." E. W. T., Gainesville, N. Y.——"If you want a true but old sketch you have it here: Amos G. Fassett in 1861, killed a hog 20 months old that weighed 777⅓ pounds. It was a cross between the Chester White and the Berkshire. He raised the pig himself. It weighed 30 pounds when four weeks old. It was fed at first on milk, then on pudding; the pudding was made of corn meal and a little salt. After eating all the pudding he wanted, the hog had a handful of whole corn. There was no need of hiring any butcher, for there were present about 20 men with a pair of scales, to see Fassett's hog killed." E. A. F. Hancock, Vt.——"The Thanksgiving Number is splendid. We think all those who found fault with Mary Wager-Fisher's "Dark Side of Farm Life" can forgive her now, for she has written of a very bright side. After reading her article, every word of which is true, we felt so proud to be farmers! Her dark side is true also. The idea of expecting it to be attractive! We very much admire Mary Wager-Fisher and Annie L Jack." E. G. L., Essex, N. Y.——"I am greatly interested in the RURAL experiments, especially in raising potatoes, as I am making that a specialty. I have shipped to market the last season over 3,000 bushels from 15 acres. I raise Hebrons and ship them early, commencing about the middle of August. They net me 50 cents per bushel here. I have used the Aspinwall Planter for three seasons. It is a perfect working machine. I intend to plant 40 acres next season and must have a digger. I use no manure except ashes and superphosphates. I used the last season about 1,300 pounds of the latter per acre." E. B. TRUE, Orleans Co., Vermont.——"On a cold and stormy winter's day, when everything is covered with ice and snow, when there is little life to relieve the dreary death-like appearance of the landscape, it is a relief, a positive pleasure, to have a good-sized flock of crows in the neighborhood. Their peculiar antics, their harsh chattering, their serio-comic actions, even their very boldness are fascinating at this season and relieve the monotony of the winter. After all the hard stories which have been told about the crow; after all our emphatic language when we have found evidence of his depravity in our corn fields, I am not so sure that we would exterminate him if we had the power to do so." CROW LOVER.——"Here is a simple remedy for the currant worm, which I have used successfully for 24 years and it has never failed. Try it! Take one ounce of sulphate of iron, (copperas) and dissolve it in two gallons of water and apply to currant bushes with a watering pot and rose." J. S, Sherburne Falls, Mass.——"People are talking about the good qualities af Japanese buckwheat. I sowed 1½ bushel of Silver Hull buckwheat on July 20 and harvested 52 bushels. This was my first sowing of buckwheat. I shall sow some of the Japanese also next year." F. W. B, Pottsville, Pa.——"I most highly indorse the RURAL'S plan of enlisting the ladies in its method of potato culture. I feel very sure that if the ladies espouse the cause it will be a success, and if it will be any encouragement to the good cause I will take pleasure in donating a half dozen Idaho Pear trees one to each successful competitor. In thinking the matter over, it seemed to me this would be a suitable prize not only from the intrinsic value of the pear, but also owing to the fact that the Idaho was originated by a most estimable woman." JNO. H. EVANS, Lewiston, Idaho.——"I am a woman 75 years old, but I would like to enter the RURAL'S potato contest. The young ladies had better look out." N. B., North Dartmoor, Mass.——"After a few years' acquaintance we feel very much attached to the RURAL, and are much interested in the 'potato contest,' and glad to see such a wide-spread interest in it from all parts of the country. It will certainly stimulate and encourage many to interest themselves in the work, who might never have thought of labor in the field. It was a capital thought. Who knows what well-springs may be reached by it." NEAL HAMBLETON, Lancaster Co., Pa.——"The RURAL satisfies m If it can be made better, why it shou e done of course; but if it can be kept a good as it has been in the past it may count on me as a subscriber while I am above the daisies. The editor should come over to Canada some time; we should like to see him." W. S., Beansville, Ont.——

Pomological.

HOW TO GROW FRUIT.

RES. T. T. LYON.

Lovers of the business alone should engage in fruit culture; how deep to set trees; when to prune; at what hight to permit branching.

IN a report of the Herkimer Farmers Institute, at page 819 of the RURAL, Seth Fenner is reported as saying, among a variety of good things, under the above head—"If a man has no love for fruit culture, he had better stay out of the business. If there is any one branch of farming that needs careful thought and brains, it is successful fruit culture"—a very correct conclusion, as is also his advice concerning the choice of soils, their preparation and under-drainage. To the last I will add, however, that the planter will do far better to pay the full additional cost of thorough under-drainage for land with a thoroughly permeable subsoil than to attempt to secure the needful conditions by under-draining upon a retentive subsoil.

The direction is given to "set the tree as deeply as it grew in the nursery." This may do in the soils specified, but it should by no means be accepted for all soils. On very retentive soils (and some growers must plant upon such or not at all), the trees should be planted almost if not quite upon the surface and merely earthed up to the hight at which they stood in the nursery, while on light, dry soils they will be better planted somewhat deeper, and in very light soils even several inches deeper than when standing in the nursery.

I regard the directions for pruning as, in the main, sound except that the cutting of any other than small branches, in May, while the sap is just beginning to move, is quite liable to result in bleeding and consequent disease. While pruning "with a jack-knife," is a light matter, and may be done at almost any time, all pruning to secure the growth of a proper head, or to encourage the production of wood for any purpose, should be done while the tree is in a dormant state. Later on, if it becomes desirable to hasten or increase fructification, pruning while growth is in progress, or during the summer, may be expected to tend to that result.

To my apprehension, the most objectionable advice is—"Never permit a limb to grow from the trunk less than five feet above the ground. This will allow a horse to pass underneath the tree, when cultivating the crops." There are wide differences in the habits of trees; some, like Rhode Island Greening, Talman Sweet, Roxbury Russet, and others, would become low-headed trees, even if branched at five feet; while Early Strawberry, and Benoni among apples, and Buffum, Clapp's Favorite, and many others among pears, would soon grow quite beyond reach if branched at this hight, and would scarcely at all interfere with cultivation, even if branched at the surface.

If even the most spreading varieties be branched within one to three feet of the ground, varying to correspond with habit, although the head may somewhat interfere with cultivation while young, there will be little difference when older, since the tops, even if branched as high as six feet, will, when loaded with fruit, generally droop so low as to preclude cultivation; while the shade of the heads of low-branched trees, and when of bearing age, of high-branched ones also, will effectually prevent any injurious weed growths underneath, and thus obviate the need of cultivation there. This will generally be true of low-branched trees almost from the time of planting.

Of the obvious convenience of low-branched trees, so far as the force of the wind, general management, and especially gathering the fruit are concerned, I scarcely need speak. I will only add that the soil is usually filled with feeding rootlets, even beyond the extent of the branches, and that, therefore, horse-cultivation, within that limit, should by no means be permitted.

Van Buren Co., Mich.

Various.

PROLONGING THE SEASON FOR GREEN CORN.—During the past season, I arranged so as to have sweet corn at all possible stages for the table, planting every two weeks as long as there was any chance for its maturing. On the night of September 28th, there came a frost severe enough to kill the corn that was still green and prevent further growth. At that time I had some just fit for the table and some not quite filled out. The next morning I cut it all up before the frost was off and put it up in large shocks, leaving it there in the field. For more than a month afterwards it rained so often that there was no chance to get it in dry, and occasionally I would go out, open the shock a little and break off some ears for dinner. I then got in a part, put it in a cool place and in bulk, and had fresh corn daily for some two or three weeks, when I drew in what remained outside and treated it in the same way with the same result. It is now all gone with the exception of a few ears well filled but green, which I packed away in the husk in a wet place, as an experiment, and that I think from its appearance would be good boiled to-day (Dec. 12th). In view of this accidental experiment, may it not be possible by a little effort to extend the season for having green corn upon the table, even in this climate, with all its frosts, from one to three months?

Cut green when just filled, keep moist and cool, and pluck when you want it.

N. H. WILSON.

Farmers' wives are not generally "farmerines," which might mean tillers of the soil. Many of us have all we can do without trying to draw this side of the cart. Yet every one of us means to be helpful in case of necessity or a chance to benefit ourselves. As for me who am a "home-keeper" and not a tiller of the soil, I will enter for the "potato contest" "FARMERINE." H. L. Faribault Co., Minn.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

A VERY handy way to send coins in a letter is described in the Writer. The money is laid between two thin pieces of pasteboard, such as old postal cards cut to a handy size, or even two pieces of blotting paper; the coin is then stitched in flat with the sewing machine. It cannot slide about, or break out, and it does not make a clumsy package. A very convenient idea, and one easily carried out.

* * *

IN the early part of November the latest eccentricity in veils appeared in New York; a big piece of sprigged or dotted net, shirred at top and bottom, the upper part gathered around the crown of the hat—the lower part tied with a ribbon about the wearer's neck. They are worn over big, wide-brimmed hats and are decidedly baggy. The newspapers irreverently call them fly-traps, but their more dignified title is that of Hading veils, after the French actress now visiting this country. When they first appeared, one would hardly see one worn in the course of a promenade and it would attract much attention, but by the middle of December they were worn by dozens and seen everywhere. It is rather a ridiculous fashion, but it finds plenty of followers.

* * *

DURING the cold weather one who is the victim of an unheated bedroom is very apt to neglect proper bathing, and yet it is as necessary as in warm weather. In so many country houses the bedrooms are really too cold to take a bath without risk of a severe chill. The only thing to do is to arrange for the bath in a warm room. Even in very cold weather we have found the advantage of bathing the feet in cold water before going to bed; the feet are not kept in the water long enough to chill the body and are thoroughly scrubbed with a towel until all in a glow. In many cases this is an effective remedy for cold feet. Another thing recommended by many doctors as a preventive of cold is to bathe the chest and throat night and morning in cold water.

* * *

A VERY useful little gift is a postal card case. To make it, take two pieces of cardboard a little larger than a postal card; from the front piece cut off the upper right-hand corner. Cover the outside with fancy silk, plush, or chamois leather; it may be painted, embroidered, or left plain. Cover each piece with an inner lining of silk, and neatly overhand the two pieces together. Put a small cord around the edge, and put a little bow on the upper left-hand corner. Sometimes a narrow strip of silk is overhanded between the two pieces, giving space for a larger number of cards.

FEAR IN CHILDREN.

I WAS much interested in an article in the RURAL under this title. The author, "A Mother," so nearly portrayed my own troubles, at night, from fear, when a child, of, I knew not what; (but I think my fears were more of people than anything supernatural) that it seemed as though it was my very self she was writing about.

I well remember how I used to clutch the sheet, and pull it over my head, much to the disgust of my small bed-fellow, two years older than myself; and in the morning the entire sheet would be lying above my head, on the pillow. I wonder, as I think back, that I did not smother, for I did not dare put my head from under the bed clothes in the dark.

How often I called to the patient mother in the "wee sma' hours" of the night, "Mother are you awake?" and "Yes, dear," lingers yet

in memory, and causes me to be patient with my own fear-stricken babies. I must confess, I am not very courageous now. B. H. J.

THE GIRLS' SEWING CLUB.

I HAVE always known that I was meant to have a "mission" in life, but somehow until lately I never could find out in what particular line it lay. I couldn't teach a class in Sunday School. I had tried, and beyond the questions and answers of the lesson book, I couldn't find a word to say. I could have all the children at my home on a Saturday, and make their little hearts glad, but I couldn't moralize, and I loved them all so much that I couldn't lecture them, even when I caught them playing pranks under the very nose of the superintendent. I live in a village where there are few really poor people, but there is a great field for active benevolence of a certain kind among those who are above actual want, and it came to me like an inspiration that it would be a sort of benevolence to teach the village girls to sew. It is not easy for mothers with all the care and work of a large family, to find time to direct the little stupid fingers that hold the needle so awkwardly, and must have the knots put in, and the needle threaded, and the end fastened, for every two or three inches of sewing.

It was one thing to think of it, and another to manage to get the children together. They would need some other lure than learning to sew, so I began in a very small, modest way by asking the two little girls of my next-door neighbor, who had a teething baby, and several small boys besides, to come in and spend the afternoon. They were nice little girls of eight and ten, and I pleased myself with the thought of how much help they would be to their tired, patient mother in after years.

I thought of my own childhoood, and recalled the patchwork which had been so dear to my girlish fancy. I never tired of looking over my "blocks," and examining the different patterns of the calico, and a fresh design was always an incentive to renewed labors. I cut a number of square patches from the prettiest bits of calico in my possession and basted them firmly together; then after I had amused the children awhile with books and pictures, I proposed that we should make a dolly's quilt. As I had supposed, they had never used a needle, and we did not make very much progress that afternoon, but I had interested them, and that was the principal thing. I gave them leave to bring several of their little cousins and friends the next week, and thus was the nucleus of our girls' sewing club formed.

After the dollies' quilts, came dishcloths for mamma, and very proud was each little girl to carry home to mamma a nicely hemmed dishcloth. It was not all plain sailing, and at times I felt as discouraged as most people who have undertaken self-imposed "missions," but I persevered, and in course of time the needles did not get so persistently sticky and bent, and the threads were less grimy.

Dish towels and all sorts of old soft muslin dusters were hemmed by my industrious little band. I did not ask them to bring work from home until they were able to do presentable work, then they were encouraged to bring cloth to make into simple undergarments for themselves. With very poor children it would be a fine charity to furnish canton flannel, cutting it into warm night-gowns, drawers, waists and skirts. It will help the work along wonderfully, and be a great incentive to them to persevere if you foster their love of the beautiful by giving them some strong, simple edgings to sew on them. Encourage them not only to sew, but to sew well. It is a dear, old-fashioned accomplishment, that of being able to hem, fell, back-stitch and gather neatly.

They have learned to sew on buttons, to make button-holes, and to darn stockings, and I flatter myself that they will make far better wives and mothers for my year's work. A wealthy lady who became interested in my little school sent a neat woolen dress pattern for each little girl for Christmas, and after the holidays I shall have each child make her own dress entirely with her own hands.

It only takes one afternoon a week, at least that is all the time I can spare to give to our club, and it seems to me a most potent way of doing good. What do the RURAL sisters think of it? MINNIE GREY.

DOES AGE BRING WISDOM?

IN regard to the neglect of their health and disobedience to the laws of hygiene, I think old people are as much to be censured as the young folks. A woman, though she be a grandmother, will run upstairs until it becomes a physical impossibility for her to do so. She will eat the wrong things, although she knows they will disagree with her, and she will overwork without reflection that this means premature old age, and mayhap helplessness.

"Mother is just as apt to go to the well for a pail of water without her bonnet as if she did not have to tell each of her half dozen brood, a dozen times a day, to put their hats on before going out," said a young lady, and half an hour later she, too, accompanied a friend to the door, and stood gossiping on the piazza long enough to get chilled through. We have to pay dearly for all such imprudences, sooner or later. A friend of mine was accustomed to move her square piano, on sweeping days, without aid, and I have even heard her boast that she had once moved it into an adjoining room. The cancer in the breast from which she died after great sufferings, was traced to a bruise made by pressing against that heavy article of furniture when moving it.

Some women will clean house in May, even though the weather may be very unsuitable: result, heavy cold, heavy doctor's bills to pay, and much discomfort to the whole family.

"I should be miserable if I did not get my washing out of the way on Monday," said a neighbor to me a short time ago. It was a rainy Monday, damp, cold and penetrating, but she washed, and blued, and wrung, in her steam-heated kitchen, hung such unstarched pieces on the line as she thought would be benefited by remaining there all night to "freeze as white as the driven snow," said she with more poetry than I thought the subject warranted. On Thursday I found her in bed with pneumonia, and the clothes were still unironed, while if she had waited until Wednesday, she would have had a fine day, and the work would have advanced further, to say nothing of her freedom from suffering.

More women have died from too rigid an adherence to the idea that Monday is the only day of the week suitable for washing, than we "dream of in our philosophy." System is a good thing, but it may be carried too far.

I am sorry to have had such a circle of senseless acquaintances, because a man, and I suppose a woman is known by the company she keeps, but I once knew a young lady who would walk in the rain without taking any of the usual precautions to keep from getting her feet wet, and to all remonstrances would say "I never take cold." For a time it seemed as if she could commit almost any imprudence with impunity, but for the past 10 years she has been the victim of rheumatism in a most aggravated form.

People forget that as they grow older, they cannot safely endure excess of work and must husband their resources. Don't be afraid of confessing that you are not as strong as you once were. It won't make you an hour older, while every time you err a little on the side of care and prudence, it will add to your chances for a long and comfortable life. I never can understand the feeling that makes people shrink from acknowledging that they are growing old. One can only be "sweet sixteen" for a single short year. To my mind the woman of sixty, who has grown old wisely and gracefully, is far more pleasing an object or companion than an unformed schoolgirl. Don't be afraid of old age which must come to every one if he lives long enough, but see to it that your wisdom increases with your years to the benefit of both mind and body. SELMA CLARE.

GOLDEN GRAINS.

IF we shut our eyes to the beauty of things around us, who is to blame if we find life dreary and monotonous .....

BE thrifty, but not covetous: therefore give
Thy need, thine honor, and thy friend his due;
Never was scraper a brave man. Get to live;
Then live, and use it; else it is not true
That thou hast gotten; surely use alone
Makes money not a contemptible stone.
—*George Herbert.*

THE CHRISTIAN UNION says that Bronson Alcott was a vegetarian. Once he told Dr. Walker, of Charlestown, his belief that the eater of mutton became a sheep, the eater of beef a cow or ox, and the eater of pork a hog. "And is it then true," asked Dr. Walker, "that vegetable eaters become poor potatoes?".....

PRAISE not thy work, but let thy work praise thee; for deeds, not words, make each man's memory stable. If what thou do'st is good, its good all men will see; musk by its smell is known, not by its label.....

THERE was once great consternation in the office of "Zion's Herald" when the writer of an ordinary article upon a mother in Israel, having said in pious phrase that she died and "claimed the promises," the paper was made to aver that she had died "and cleared the premises." And it was out at Worcester, Mass., where the Rev. George H. Hepworth, having declared in a public address, "I am not a free lance," the sedate "Spy" gave him fame by printing the sentence, "I want a free lunch."....

DR. SPEAR, in his "Bible Heaven," justly says if the pangs which one feels be the natural and proper result of thoughtfulness, then he may be sure that there is some serious error in his practical life and what he should do is, not to dismiss the thinking because it is unpleasant, but to reform and reconstruct that life. Rest to the soul gained by mere dissipation of thought, is always purchased at a very dear price.....

THE PILGRIM TEACHER says one is great in the kingdom of heaven just in proportion as he loses his desire for greatness, and forgets himself in his desire to be of service to others. When one honors all others but himself, then he becomes honored of God. "For though the Lord be high, yet hath He respect unto the lowly; but the haughty He knoweth from afar."....

DR. JOHN HALL says that one who is healthy does not wish to dine at a dissecting-table. There is evil enough in man, God knows! But it is not the mission of every young man and woman to detail and report it all. Keep the atmopshere as pure as possible, and fragrant with gentleness and charity.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

He who distinguishes the true savor of his food can never be a glutton; he who does not cannot be otherwise. A Puritan may go to his brown bread crust, with as gross an appetite as ever an Alderman to his turtle Not that food which entereth into the mouth defileth a man, but the appetite with which it is eaten. THOREAU.

A FAMILY OF BOYS.

THEY sit in front of me every Sabbath, and I must confess that they sometimes cause my attention to wander. Their little round heads look so funny sloping up or down like a pair of steps. There are seven of them, and the oldest is only 12. Their jackets are so neat and well brushed, that only an experienced eye can detect now and then a tiny darn in one of the elbows. When I come in late with my small flock—I should say with my one ewe lamb—it is such a reproach to me to see those seven boys headed by their tiny mamma, already in their pew, for Monsieur B——. doesn't count in the matter of getting them ready.

I had a pleasant little afternoon chat with madame B——. the other day, who meanwhile was busily repairing a suit belonging to her eldest boy, going about it in such a scientific way that, in my usual fashion, I mentally made a "note on it."

The sleeve linings were badly worn. These were ripped out carefully, much use being made of a sharp penknife, always kept for the purpose. The old lining was pressed, and the new one cut by it exactly, made and put in in the same manner, care being taken to cut both at once so that they might not turn out to be for the same sleeve. The sleeves themselves were a little short, and the cuff was ripped off, and put on an inch lower down, the sleeve faced inside with cloth of a different pattern, but matching somewhat in color. Next the pockets were examined. Those that were badly worn where they joined the garment, were ripped out entirely, pressed, and new ones cut from stout muslin and put in carefully. Others required patching, or piecing, half way down. In every case, the new cloth was cut by the old, and allowance made for the seams.

The button-holes were all worked anew, and the whole garment thoroughly sponged with warm water to which two teaspoonfuls of ammonia had been added to a quart of warm water. Care was taken to dampen every spot. Grease spots were removed with benzine, the coat hung to dry on a form, and pressed while still a little damp. The greatest triumph of home tailoring was the repairing of a light overcoat of her husband. The silk facing was worn, the buttons had torn out bits of the cloth, and the whole appearance was shabby in the extreme. The facings were taken out carefully, pressed, and new ones cut from a breadth of an old brown silk dress which happened to be of the right shade, and of so good a quality that Madame B— said it would wear as long as the rest of the garment. While the linings were out the corners of the pockets that had torn loose from the coat were neatly fastened to muslin stays on the wrong side and firmly stitched down on the right with the machine, after which they were pressed, with a wet cloth laid over them. Bits of the cloth cut from a wide seam were laid under the holes made by the tearing off of the buttons, blind-stitched down neatly first on the wrong side, and then on the right around the ragged edge. They were then pressed, and the buttons sewed on firmly.

The facings were felled in neatly by hand, and the frayed fronts and collar bound with a silk braid matching the cloth in color.

"How did you become such an expert tailoress?" said I.

"There is no teacher like necessity, and you see I have so many boys that I can afford to make a business of looking after their wardrobes. I dare say if I had only one, I should find it a more difficult matter," this politely, as if to prevent any feeling on my part because the aforesaid ewe lamb more often sports holes than she does patches.

However, I have determined to reform, and I have been mending and patching and repairing ever since my visit to Madame B—, and so in love with my new avocation have I become, that, like Alexander, I am sighing for new worlds to conquer. A C.

"IT is shallowness that decides instantly; that always thinks it knows what it is about."

CHEAP DISHES.

A DISH of yellow Indian meal, boiled a long time in a double boiler, served in a pretty dish, and eaten as a vegetable, with meat, or as a dessert, with sirup, or milk and sugar, and stewed fruit, is by no means to be despised. Cut into slices half an inch thick, and fried a golden brown in a little hot dripping, it forms a nice accompaniment to sausages, hash, fried or broiled ham for breakfast.

Most recipes for corn bread, pone and hoecake, call for three eggs to as many cups of milk. I have experimented with one egg, using a little more baking powder, and find the result very satisfactory.

Macaroni may be cooked in such a manner as to be as costly as game, but it may also be made very appetizing at a small cost. It should be yellow or brownish in color—the white sorts being poor. It must be simply wiped, and broken into convenient lengths, dropped at once into boiling water containing salt. As soon as it is tender, which you may ascertain by pressing it between the fingers, drain and add the water in which it was cooked, to the stock-pot. Leave the macaroni in the colander while you melt together over the fire a tablespoonful each of cold butter and flour, and add slowly a pint of boiling water, or half a pint each of water and broth; stir until smooth, season with salt and pepper, and lay in the macaroni to heat while you fry a shredded onion in a little fat; dish the macaroni and pour the onion over it. This makes an excellent dinner with a pound of fried, broiled or boiled sausages, a dish of boiled turnips, and a bread pudding. You may even preface it with one of the inexpensive "winter soups" lately given in the RURAL.

A nice way to cook sausages is to prick them with a fork; lay them in hot water for a few minutes, roll them in flour and fry brown. Cut as many small slices of stale bread as you have links or cakes of sausage, and fry them in the fat; dish one under each sausage. Make a gravy by pouring a cup of boiling water into the fat in the pan thickened with a tablespoonful of flour wet with cold water; boil up, season, and pour over the bread.

Very good fish cakes can be made of fresh or canned salmon, or of any kind of cold boiled, baked, fried, or broiled fish. Their excellence will depend upon your skill in seasoning, and the delicacy and creaminess of your mashed potatoes. Mix together equal quantities of fish and potatoes, season with salt and a bit of Cayenne pepper, and beat well with a fork. You may then roll it in crumbs and beaten egg or not as convenient.

A delicate little breakfast dish is made from the veriest trifle of minced poultry, ham, or ham and veal. Mince the meat of whatever kind very fine, season rather highly, bind together with a beaten egg or a part of one, according to the quantity of meat, and

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

then inclose a tablespoonful or so in a mashed potato, so that it looks like potato cake; dip in egg and crumbs and fry by immersion. A little dish of this kind disguises the fact that it is made of scraps, and is so appetizing that you may be sure of its meeting with a hearty reception. AUNT ALICE.

THE London Queen says that the old-fashioned scold among cultured and refined people is as obsolete as the branks and the ducking-stool, by which she was checked and punished. Big words and furious tempers do not come into the order of modern life; and the woman of condition who should storm like a whirlwind through the house, scattering the wildfire of reproaches and objurgations as she went, would forfeit her claim to be held as a true gentlewoman, and, no matter what her wealth or inherited position, would be relegated by public opinion to the ranks of the essentially vulgar and irredeemably unrefined. But the race survives, though the manifestations be different; and the scold of the ducking-stool, the shrew of the street, is to be found in the discontented, the otherwise-minded, the persistently nagging, the constitutionally depreciatory, the wilful makers of unnecessary crosses, which, after having made them, they bear with many sighs and audible groans, the general putters-to right from a higher moral platform than that inhabited by common-sense people of the world. All of these may be women of gentle bearing, refined speech, perfect manners, but they are none the less survivals of the earlier, coarser type.

BREAD.

GOOD flour and good yeast are essential to successful bread-making. We may also add that yeast, wetting and salt, should always be thoroughly mixed before mixing with the flour, and that warm, dry flour produces superior results. To make good, soft yeast: with two cups of boiling potato-water scald one cup of wheat flour, stirring till smooth. Then add two cups of finely mashed potatoes, a tablespoonful each of salt and sugar, beat well, add the strained hop tea obtained by steeping a single handful of hops in a quart of boiling water while the potatoes were cooking, stir, and when cool enough not to scald, add a cupful or two of good yeast, cover with a thin cloth and set in a warm room to rise. When very light (usually next morning) I put it in the yeast jar which in the meantime has been washed, scalded and dried, cover closely and put it in the cellar. If made while cooking potatoes for breakfast or dinner but little extra time is required in its preparation.

To make wheat bread:—For each loaf required take six cups of sifted flour, and to two cups of lukewarm water add one-fourth of a cup of yeast and one-fourth of a heaping teaspoonful of salt, pour this into the flour and with the hand mix quickly and thoroughly, not kneading at all; then cover with another pan (this prevents a crust from forming on top) set it to rise, at bed-time, or if very cold weather, early in the evening. In summer it may merely stand on the kitchen table, in cold weather it may if necessary be wrapped in a thick cloth and a warm board be placed underneath. Early in the morning it is usually light and is put directly into the baking pans, using no flour except a mere dust rubbed on the board to keep it from sticking, not kneading it at all, and handling it only enough to form it into loaves. Cover and set it in a moderately warm place to rise. When light, bake about an hour—sometimes a little less. When done the loaves should *lift light*, the bread be fine-grained and spongy, sweet and delicious.

Another good rule is to observe the same proportions as to ingredients, but on first mixing the bread, knead it thoroughly, then let it rise and in the morning make it into loaves without kneading, using no more flour. Some flour requires less wetting than other, so that it is sometimes found necessary to merely allow to each loaf two cups of wetting, including the yeast. After a little experience, one need not measure the flour, but may pour the wetting into the center of a pan of flour, mix 'till of the proper consistency, then knead thoroughly and set it to rise. My sister, a very successful bread maker, makes bread this way, only at all times of the year she leaves the bread upon the kitchen-table to rise, from first to last, never putting it near the fire until it is ready to bake; but she usually makes it rather early in the evening, in cold weather.

To make rye bread: For one large loaf, take three cups of wetting—about one-third cup of yeast, the rest luke-warm water—add a level teaspoonful of salt, pour all into a pan containing one cup of wheat, and seven cups of rye flour, stir with a strong spoon till thoroughly mixed, pour into a greased baking pan, cover and set it in a moderately warm place to rise; when very light bake till thoroughly done, usually about an hour. We think rye bread is best the next day after it is made. GLADDYS WAYNE.

MY method of bread making is not new, simply good yeast and flour, and *common sense.*

One cake of compressed yeast dissolved in about two tablespoonfuls of warm water, add one tablespoonful of salt, two of sugar, and one quart of warm water. Stir well and add two-thirds of a cup of sweet lard, mix well and stir in flour enough to knead without sticking (I use roller process). Put back in pan, cover and set in a warm place until morning, when the pan should be full. As soon as convenient I divide it into four parts, mold into loaves and put into tins. When full bake a nice brown in a moderately hot oven. M. E. THOMAS.

ACCORDING to Paris fashions the style of dressing the hair is certainly lower than has lately been worn. One way of arranging is to have the hair twisted round like a rope, at the nape of the neck, with one or two curled ends escaping or falling carelessly. In front the fringe is massed together like a thick lock in the middle. Another way is to plait the back hair in two wide plaits, raised up with a comb, and then falling slightly on the neck. In fact, the nape is now covered, but the hair does not descend lower except in the case of curls being worn.

BUTTON-HOLES.

SOME ONE not long since gave her way of strengthening every-day button-holes. I use coarse thread, as coarse as No. 16 spool cotton, and find it answers well, and does not look so bad as a ragged button-hole. MRS. L. H. NILES.

APPLE CUSTARD.

PARE, core and quarter tart apples, and cook carefully, not to break the pieces. Sweeten and put into a pudding dish. Make a custard of a pint of milk, three eggs, sugar and flavoring. Pour over the apples and bake until the custard is firm. MRS. ECONOMY.

THE VERY BEST GINGER SNAPS.

ONE large cup of butter and lard mixed; one coffeecup of sugar; one cup of molasses; one-half cup of water; one tablespoonful of cinnamon, one tablespoonful of ginger, one teaspoonful of cloves, one teaspoonful of soda dissolved in hot water. Flour for a pretty stiff dough. Roll out thin and bake quickly. They keep well.

OLD-FASHIONED GINGER BREAD.

ONE quart of good New Orleans molasses; three-fourths of a pound of butter, one tablespoonful of soda, one gill of water, ginger to taste. In winter it will take more water than in summer. Mix with flour as soft as you can roll out. Roll about one-half inch thick. Cut in squares or cards and bake in a flat pan.

GOOD FRIED CAKES, ETC.

TAKE one pint of butter-milk, one egg, one cup of sugar, one large tablespoon heaping full of butter, a little ginger, one teaspoonful of soda. Knead as soft as you can roll, and drop in hot fat.

For canker-sore-mouth, burns, chafes, slight flesh cuts, the *white of an egg* is the *best* remedy.

For rattle-snake bite I used a bottle with a large mouth to cup the wound, inserting it first in *hot* water, then immediately on the wound. After removing it, I washed the flesh in strong saleratus water, and a green, yellowish fluid came off. After repeating this several times, I put on a mixture of one teaspoonful of salt; the yelk of an egg and as much gunpowder as I needed to make a paste. This I spread on a cloth and bound on to the wound, renewing it several times until it refused to adhere. I should have said that I bandaged the limb below the knee, and I also put on worm-wood steeped in vinegar. After two days, the swelling had disapeared and the boy played about as if nothing had happened. I have seen this recommended for the bite of a mad dog. MRS. VIOLA GRIBLIN.

PUMPKIN BUTTER.

TAKE out the seeds of one pumpkin, cut it in small pieces and boil them soft. Take three other pumpkins, cut them in small pieces and boil soft; put in a course bag and press out the juice. Add this to the first pumpkin and let it boil ten hours or more, stirring often. If the pumpkins are frozen, the juice will come out much more readily. This will keep best in a wooden box or keg.

PUMPKIN CHIPS.

PARE a ripe, rich pumpkin, remove the seeds, and slice all the best part of it in equal-sized chips and as thin as you can cut them. Weigh, allow one pound of granulated sugar and a gill of lemon juice to every pound of the chips. Lay the chips in a large earthen vessel, strewing the sugar between them and putting the lemon juice over the top. Cover and let stand over-night. Next day place over the fire and boil slowly until the chips are tender, crisp and transparent all through. Spread the chips on a dish to cool and then put into glasses or jars, straining the sirup over them. Place a thin paper dipped in vinegar over the top and seal. AUNT ADDIE.

AUNT JEANNIE'S RECIPES.

BROWN BREAD.

THREE cups of rye meal and five of Indian. Add a teaspoonful of salt and dissolve a teaspoonful of saleratus in a pint of sour milk. Mix a little too stiff to stir with a spoon. You will require a little more milk. Put into a greased tin and bake three hours. The oven should be quite hot when first put in to prevent cracking on top, but afterwards it should be moderately hot.

APPLE PUDDING.

PARE and quarter enough tart apples to fill an ordinary pie tin, adding a little water, perhaps two tablespoonfuls, and set on the back of the stove while you make the crust. Sift into a pint of flour one half teaspoonful of saleratus, and one heaping teaspoonful of cream-of-tartar. In this rub a tablespoonful of butter and mix rather soft with sweet milk. Roll out the size to cover the tin of apples, and place in the oven. When done turn on to a plate, which of course brings the apples on top. Spread with butter and cover with sugar. Very nice. FANNY HAY.

DEFECTIVE VISION.

A WRITER in the North American Review holds that coffee is a frequent cause of defective vision. Children who are allowed to partake freely of coffee, he says, become fussy, noisy and half wild with mischief. They will advance rapidly in their studies, but hate work, and at times become indifferent to their books. They grow rapidly, but not aright, and become men and women too soon.

I am sure that few parents need the caution, or rather I feel that few *should* need it, for I have seen injudicious mothers allow their children to have the regulation cup of coffee which was served to the older members of the family. Bring a child up to have what my little one calls "white tea," and he will have the warm drink which is perhaps necessary in cold weather, without any of the harmful effects of coffee or tea. It consists of a tablespoonful of either coffee or tea, in a cup of hot milk sweetened and is both harmless and pleasant. MOTHER.

News of the Week.

HOME NEWS.

SATURDAY, January 5, 1889.

The Brotherhood of Locomotive Engineers complain that other roads refuse to employ the engineers and firemen who stuck last spring on the "Q" system, the strike on which has not yet been "declared off." The men also say that other roads have helped the "Quincy" financially and otherwise. They offer to declare the strike "off" if the "Q" road will give the same chance to the old employés as it does to others. Threats are made that if this isn't done, trouble will be caused to the "Q" and all assisting roads.....The debt of Canada increased about $12,000,000 during the past fiscal year and stood on June 30 at $234,513,358..... Nearly 100 designs for the proposed Grant monument in New York City have been submitted in competition for the prizes offered by the Executive Committee of the Grant Monument Association. Five prizes will be given, ranging from $1,500 to $200, and nobody will be barred because of nationality. It is not unlikely that the monument may be erected over the tomb in this city..... Mrs. Schofield, wife of the General, died the other day .. ....Mr. Joseph Anderson, brother of "Our Mary," was married to Gertrude Barrett, daughter of actor Lawrence Barrett, at the Catholic Cathedral of the Holy Cross, Boston, last Thursday, amid the greatest *éclat*..... There has been an unusually large amount of talk lately on both sides of the frontier about the annexation of the Dominion to the Union; but while there are on both sides a considerable number of strong and prominent advocates of such a measure, the great bulk of the people take little or no interest in the discussion. There is a quiet but deep-seated conviction in this country that annexation is inevitable. The belief is pretty general that it will occur either voluntarily, on account of the desire of the Canadians to share in the great profits of free trade with this country, or compulsorily, as the result of a distant war with England. There is no general desire, however, to hasten the step as a result of either cause .....Senator Stanford, of Cal., has sold to Miller & Sibley, of Franklin, Pa., the weanling colt Electioneer, out of the mare Beautiful Bells, for $12,500—the highest price ever paid for a weanling colt in America. This colt is a full brother to two others that have beaten 2:20 at three years old..... After all, it is denied that the great English race horse, Ormonde, is to come to the United States, although it is not denied that an American offered $85,000 for him; but it is said that a man from Buenos Ayres offered $125,000 for the wonder. His owner, the Duke of Westminster, the richest noble in England, is going to breed him, and will probably keep him if his get are not roarers like himself.....The town of Springer was laid out as the capital of "Oklahoma Territory" on Dec. 31, and Indian Territory cattle men were elected officers. It had then a population of 5,000. The "boomers" captured on Dec. 10, have been released. It looks very much as if the county would be opened with or without the consent of Congress which is a trifle dilatory in acting on the Springer Bill establishing the Territory ....Three parties of five each, have been persistently hunting offending negroes since that trouble at Wahalak, Miss., about a fortnight ago. They are known to have met and killed four negroes in spite of the piteous appeals for mercy made by the latter, some of whom said they had taken no part in the "difficulty." All of them owned small farms, and all the farms have just been "located" by white men. The whole trouble was caused, it appears, by lawless acts of whites who wanted the colored men's farms..... The Chicago Railway Age reports that during 1888, 19 railroads, with almost 1,600 miles of lines and nearly $64,000,000 of bonds and stock, have been closed out for the creditors. .....The remarkable weather which we are now enjoying reached its climax on Wednesday last, when not a drop of rain nor a flake of snow fell throughout the United States. Such an occurrence at this season of the year, is probably without precedent..... ....Mr. James McMillan, who has just been nominated to succeed Senator Palmer by the Republican Legislature of Michigan, is the chief stockholder of the Detroit Car-Wheel Company, the Baugh Steam Forge Company, the Detroit Iron Furnace Company and a number of other large concerns in Michigan..... U. S. Consul Astwood, on the part of another American, has just made an offer of at least $200 000 a year to the Government of the petty Republic of San Domingo, as payment for permission to exhibit the bones of Christopher Columbus through this country for four years. The Domincan Secretary of State has administered a stinging rebuke to the shameless official for his breach of decency and propriety. Consul Astwood should at once be kicked out of the service of Uncle Sam..... The Richmond (Va.) Whig, the oldest paper in the city—in its 64th year—has suspended publication.....The State of New York is nearly out of debt, and if the Direct Tax Bill, now before Congress, is passed, returning $2,000,000 from the General Government, the tax rate will be the lowest for 50 years..... The railway mileage of the country has increased, the past year, 7,120 miles of main track in all States and Territories, except Rhode Island and Nevada. Kansas laid the most. California next.....Any person who committed murder after midnight on January 1, in this State, and who may be convicted and not pardoned, must be executed by electricity, so that "hanging is played out" here; but not as criminals wished it to be. The condemned murderer is to be parted from his relatives and all the rest of the outside world for the last time at the door of the court-room after sentence. He will be shackled and carried to one of the State prisons. A week is to be set by the judge, and in some day in that week, the man is to be killed by electric wires, and buried in quicklime within the prison walls, so that his body may be promptly destroyed. Not a prayer is to be said over the corpse or the grave, and the newspapers are forbidden to print anything about the execution, except that the sentence was carried out. It is thought by many that this clause of the law is unconstitutional as interfering with the liberty of the press, and doubtless the first execution of the kind will be more fully reported than any in late years has been. Only a few persons are allowed to be present at the "shocking" scene, however..... Private Dalzell is authority for the statement that $14,000,000 of unpaid pensions await claimants in the U. S. Treasury. He says that not less than 400,000 pensioners are entitled to receive $25 to $35 each by simply applying for it in Washington as follows:

First—Five cents per mile from place of discharge home
Second—Twenty-five cents daily for extra duty between April and October, 1862.
Third—Twenty-eight cents daily while in prison or on furlough.

He says he obtained his extra compensation as pensioner in these particulars by simply applying for it last year, and that not one in ten Americans knows anything of the legality of such a claim. Here's a New Year's gift for many of our brave soldier readers. A telegram just received from Washington casts considerable doubt on the correctness of the "High Private's" statement, however, for it says most of the money due has been paid.... The combined coal companies in the Wyoming and Lackawanna region, Pa., charge their miners working on "starvation wages" $3 per keg for powder which cost only $1.25 per keg ! ! ! .. All over the country there is a healthy, growing movement for reform in political elections. Flagrant bribery is persistently charged against both the great parties in the recent elections in many parts of the country; but especially in Indiana. Such charges are made after each election, municipal, county, State and national as well as charges of "colonization," ballot-box stuffing, etc., and the conviction is growing that the safety of our institutions peremptorily demands some amendment. The Massachusetts Legislature has just adopted a secret ballot law as a step in the right direction, and her example has given an impetus to this kind of reform throughout the other New England States, and, indeed, elsewhere also. The Australian method of voting finds many advocates. ... .The San Francisco Examiner says that the Chinese exclusion bill has brought on a great labor crisis in California, and predicts an agitation looking to the repeal of that law. It is reported that the coolies are rapidly withdrawing from the farms to supply city shops and factories where wages are higher. It is said that there is not now enough labor in the State to handle next year's crops, and that if farmers and fruit growers want cheap labor they must come to this side of the mountains for it.....The single land-tax men are preparing a monster petition to Congress for the appointment of a committee to inquire into the expediency of raising all public revenues from a tax on land, to the exclusion of all other taxes, whether in the form of tariffs upon imports, taxes upon internal productions or otherwise. Signatures to this petition are pouring into the headquarters at New York at the rate of 700 and 800 a day..... Col. John C. Dent, brother-in-law of Gen. Grant, died at his home in Carthage, Mo., the other morning, aged 73. Col. Dent served with distinction in the Mexican war and also in the War of the Rebellion.....The growth of Duluth, Minn., during 1888 is remarkable. Over $4,300,000 has been spent for improvements of various kinds, and 782 new buildings have been erected at a total cost of $2,802,600 .....Armour & Co., of Chicago, did a cash business during the year ending November 1, of $55,000,000. The firm employs 6,000 hands, and during the year took the lives of 561,199 head of cattle, 1,140,000 hogs, and 164,539 sheep ..... Congress met Wednesday and the Senate resumed the consideration of the Republican tariff bill, which will have right of way till action is taken on it on January 21. The most important change hitherto made is an amendment providing for a bounty of one cent per pound on American sugar; but this meets with strong opposition. In the House, Mr. Springer, of Illinois, introduced a joint resolution providing for the election of the President and Vice-President by a direct vote of the people and for the term of six years. It makes the President ineligible for a second term and extends the terms of members of Congress to three years, the terms to expire December 31. It also provides that each session of Congress shall begin the first Wednesday of January in each year. No chance of its passage at this session. Nothing else of importance or interest during the week, except the development of a strong opposition to the Oklahoma bill.....

Coughs and Colds. Those who are suffering from Coughs, Colds, Hoarseness, Sore Throat, etc., should try BROWN'S BRONCHIAL TROCHES, a simple and effective remedy. They contain nothing injurious, and may be used at all times with perfect safety.—*Adv.*

FOREIGN NEWS.

SATURDAY, January 5, 1889.

NEW YEAR'S is always waited for with more or less anxiety by the people of Europe, for at the "receptions" then given by the various rulers, little speeches are made which are thought to be indicative of the opinions of the sovereigns with regard to the outlook for peace or war during the ensuing year. These speeches are generally rather oracular in their ambiguity, so that very different inferences are generally drawn from them. This year, however, the general consensus of opinion is that they indicate peace. France and Russia are, as a rule, held up as the bugbears of war; but the cordial union of the "Central Powers"—Germany, Austria-Hungary and Italy—is regarded as a guarantee of peace, because it is thought that neither France nor Russia, nor both combined, will have the temerity to attack the coalition, or any of its members, for to attack one would be to incur the hostility of all. Great changes are also being made once more in the armaments of all the belligerent countries, and also in the drill and manœuvres of the various armies, to meet the new conditions brought about by the discovery of new explosives of stupendous power, and of newly invented cannons and rifles of unprecedented accuracy, rapidity and reach. It will take another year, say the knowing ones, before the various nations can be equipped with the latest and deadliest arms, and be prepared to resist these to the best advantage by new formations of troops in the field and improvements in fortifications.... .. In England, Parliament has just reassembled after the Xmas vacation, but nothing of interest has yet occurred. Of late in two bye-elections for members of Parliament, the Conservatives secured considerable gains; but the tide seems against them still. The Parnellite trial is still suspended. It is charged that the Times and the Government are prolonging the case in order to get in all the damaging evidence possible without a chance for rebuttal before the case collapses, either because the Parnellites are bankrupted or because the court may decide that there is "no case" against the accused. It is charged that emissaries for the paper hunted up dynamiter Sheridan, at Pueblo, Colorado, and promised him $50,000, $25,000 down, if he would give incriminating testimony against the accused. He declined, fearing the fate of informer Jim Carey, who was shot to death for "peaching." Evictions of recalcitrant tenants still continue in Ireland in spite of vigorous resistance. Those who offer this are tried and imprisoned usally for some years. Two members of Parliament have also been lately imprisoned for delivering speeches to crowds who persist in meeting when ordered not to do so under the Crimes Act .....In England agricultural distress still continues, and there is much stagnation in trade, and compulsory idleness in towns and cities. Strikes are frequent, and charity, public and private, is heavily taxed .... The English show no signs whatever of quitting Egypt, the chief strategic points of which are still occupied by British troops. Down at Suakim, on the Red Sea, there has been a good deal of fighting lately between the Egypto-British garrison and the besieging Arab followers of the Mahdi under Osman Digma, whom reports have killed so often. Success has been invariably on the side of the besieged, the Arabs having been repeatedly routed with great slaughter, but they require as much killing as Digma did. Lately the latter ex-merchant and slave trader said that last October the followers of the Mahdi in the Soudan had captured the German Emin Pasha and a white man, who was identified as Henry M. Stanley by a letter which was known to be in his possession and a copy of which was produced by Osman, who offered to surrender the prisoners if the town were evacuated, threatening death to them in case of refusal. Later advices from both the Eastern coast of Africa, at Zanzibar, and from the Western coast at the mouth of the Congo, go to prove that Stanley had met Emin and relieved his necessities in the way of arms and ammunition, and that both were free in November. Reports are a trifle vague and confusing, however, but the probability is that both Stanley and Emin, or the former, at any rate, will soon emerge in safety from the Dark Continent..... .. The drought in South Australia has been broken by copious rains.... ... Indian advices say that cholera prevails in a virulent form at Quilon, on the Malabar coast. It is reported that 2,000 Christians have succumbed to the disease ..... The Argentine Republic of South America has been borrowing so much money abroad as to create some alarm among foreign investors. During the past year alone, she has borrowed in Europe over $185,000,000, while her population is only 3,500,000. This sum exceeds the entire internal, foreign and floating debt of the country a year ago. Is it a bubble or the foundation of vast and profitable improvements, is an anxious question with trusting investors.....

AGRICULTURAL NEWS.

SATURDAY, January 5, 1889.

The 19th annual meeting of the Vermont Dairymen's Association will be held at the City Hall, Burlington, on January 16, 17 and 18. A splendid programme of addresses and a fine exhibit of dairy products and implements will delight visitors..... The Pennsylvania State Horticultural Society will hold its 13th annual meeting in Montgomery Hall, Lewistown, on January 16 and 17. All interested in horticulture are cordially invited..... The second annual convention of the Connecticut fruit-growers and cider-makers will be held in room 50, State Capitol Building, Hartford, on January 15 and 16. An instructive meeting is certain..... The third annual meeting of the Central Ohio Farmers' Institute will be held at the City Hall, Columbus, on January 17 and 18..... The 13th annual convention of the Swine Breeders of Indiana will be held in the State House, Indianapolis, on January 25..... The 22d biennial convention of the American Pomological Society will be held at Ocala, Fla., February 20 and 22..... ...The 34th annual convention of the New York State Horticultural Society will begin at Rochester, on January 23 .....The 22d annual winter meeting of the Minnesota State Horticultural Society will be held at Minneapolis, January 15—18, the State Amber-cane Association taking up Wednesday afternoon for its 12th annual session..... The Michigan Shorthorn Association will hold its annual meeting at Lansing, on January 19 and 20..... Governor Richardson of South Carolina, has vetoed the act accepting the Clemson bequest which left Calboun's old homestead and $100,000 for the establishment of an agricultural college. The Governor appears to fear the farmers' vote less than did the members of the Legislature..... Cotton seed of prime quality is offered so sparingly to the mills South that it is understood that the leading consumers are about to offer higher prices in order to bring out any surplus that may be in planters' hands..... ..... The Evaporator of Harden & Sweeting, at Barker's Station, Niagara Co., N. Y., the largest in the world, was burned Jan. 2. It was capable of handling between 1,000 and 2,000 bushels of apples a day. There were in the cremated building from 25,000 to 30,000 bushels of apples. Estimated loss, $10,000 .. ....The little equine whirl-wind, Jay-Eye-See, "is all right."... . .....A bill is to be introduced into the Legislature of Pa., at an early day, by Representative J. M. Baker, of Delaware Co., providing that only graduates of legally chartered colleges shall be allowed to practice veterinary surgery in that State. An exception is to be made in favor of all who have been practicing for five years preceding the passage of the act..... The National Expert Association of Judges of Swine will hold its first annual meeting at Dayton, Ohio, January 17 and 18 ..... The shipment of mutton from New Zealand and Australia to England is likely to be very heavy this year. As a single specimen, nearly 200,000 sheep have been guaranteed to the Canterbury Frozen Meat Company, of New Zealand, for shipment to London during the season of 1889-90..... ..... French farmers are complaining of the embargo on their cattle in England, and the French Government has been protesting against it with little prospect of relief, as the English base the closing of their ports on the plea of the prevalence of infectious deseases in France. The only Continental countries to whose cattle English ports are still open are Portugal and Sweden.....Hogs received at Kansas City in December averaged 236 pounds in weight, against 224 pounds in 1887 .....Copious rains in California are said to have almost assured extra good crops. In the great producing district, in the San Joaquin Valley, where there was insufficient moisture last year to save the wheat crop, there have been from three to four inches of rain, in comparison with an average of 1⅛ inch in the valley last year. In San Franciso there have been 10 inches, against three inches last year; in Martinez, seven inches, against two; in Maryville, 10 inches, against four; in Sacramento, eight inches, against 1⅛; in Stockton, 5 inches, against 1⅛; in Fresno, 4 inches, against 1⅛; in Los Angeles, 11 inches, against two..... The officers of the National and State organizations of wool-growers will meet at Washington, Jan. 10 to consider important questions relative to the American wool industry and its protection. The president of the National Association thinks that the Senate tariff bill does not provide adequate protection as it now stands.... The inspectors of the Bureau of Animal Industry of the United States, have unearthed a novel method of defrauding the United States Treasury. It has been the custom since the Bureau extended its operations to Queens County, N. Y., to appraise and pay about $35 a head for all cattle killed because of pleuro-pneumonia. The swindlers would buy cattle at $20 a head and inoculate them with the disease ..... The Hungarian maize syndicate has collapsed, having lost 3,000,000 florins.....Under an agreement lately made by the Western millers, 250 mills in the fall-wheat belt are to close down or run on half time during January, to lessen the output of flour. All the flouring mills in St. Louis, except one, closed January 2. At Minneapolis, the aggregate production of flour for last week was 60,000 barrels, against 59,480 the previous week, and 120,900 for the corresponding time a year ago. The direct exports for the week were 15,800 barrels, against 16,200 the preceding week. The receipts were: Wheat, 281,120. Shipments: Wheat, 208,320; flour, 51,676 barrels, and mill-stuff, 1,935 tons ..... Ferret breeding is a new and highly profitable branch of farming in Australia and New Zealand. One firm that has commenced the business on a large scale has contracted to supply 14,000 ferrets per annum for three years to the Government at $1.82 per head, the creatures being delivered when they are three months old. They are to be used in exterminating rabbits.....

No Need of Comment.

PRINCE'S BAY, N. Y., April, 1, 1887.
"My wife was fully relieved. We recommend Compound Oxygen to every one."
J. W. ANDROVATH.

"We have ourselves used Compound Oxygen. We confidently recommend it."

ACHILLES, Kan., April 22, 1887.
"I have great faith in Compound Oxygen."
A, LYLE MCKINNEY.

ALMOND, N. Y., May 20 1887.
"It is a marvelous remedy."
MRS. J. C. GOFF.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

"Herbrand" Fifth Wheel for Buggies.—*Adv.*

Crops & Markets.

SATURDAY, January 5, 1889.

According to the latest reports in the Northwest, West and Southwest, there has hitherto been practically no winter. There is very little frost in the ground, and, with the exception of a few isolated limited areas, there is no snow. Even Canada reports that while there have been a few days of sleighing this winter, at present all traces of snow have disappeared. All along the Ohio River, the weather has been very open, no snow, and the pastures good yet. The wheat looks well and the mills generally are supplied with wheat enough to last them sixty days. Texas reports no hard freeze this winter; in fact, they have plenty of moisture, and the weather could not have been more favorable for the winter wheat than it has been for the last sixty days. In Kansas, we find it unusally dry, and it is said that the subsoil of central and western Kansas has never been as dry at this season of the year as now. Taking the State as a whole, Kansas needs very favorable weather from now on to give her an average crop of winter wheat, and it is estimated that there is not over 15 per cent. of the old crop of winter wheat remaining to-day in farmers' hands. The movement of new corn during December in northern Kansas and Nebraska was large, so much so that the railroads found great difficulty in furnishing cars to move the crop. The recent decline, however, has checked the movement very much, and very little corn will move for some time while present prices remain. Reports from northern Dakota are that there is no No. 1 wheat in farmers' hands. The rejected grade is probably one-eighth of the crop which was raised, and the largest portion of that will be ground for feed. There has been a great deal of harrowing done during the month of December on account of the dry weather.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

BUT Mamie did not stay here. She ran across the dreary room, and standing on her toes, loosened the latch of the door that led to another apartment. The door pushed open at last, and she ran in and closed it behind her. The room was pretty compared with the other one; for it had evidently been arranged by a woman who had known a certain refinement. The window curtains were caught gracefully at one side, and little bits of ribbon and other trifles that women can make so much of, were fastened about the room.

On a scantily covered bed lay "Sarcy Sal"—at once the terror and the scorn of Drum Lake. She had been, as Mrs. McKelvey said, "an awful bad woman," but now her days of wickedness were ended. Alone, with only the sneers and contempt of her old friends, she was paying the horrible reckoning that had been gathering for her through years. Poor "Sarcy Sal"—and to think what *might* have been.

The sick woman turned her head wearily on the pillow as Mamie came running in. The great mass of golden hair rolled down over the coverlid as she slightly raised herself to help the little girl climb on the bed.

"Did you have a good time, Mamie?" she asked. "Splendid"—answered the little girl gleefully, "and see, mamma, what the Parson gave me"—and she took the ribbon from her hair to show to her mother.

The sick woman took the ribbon carelessly, and held it nearer the candle. She was about to hand it back to Mamie, when her eye fell upon the letters written on the corner, M. B. to H. A. S. G.

"Who gave you this?"—she gasped, suddenly starting with an effort from the pillow. "Parson"—said Mamie, wondering at her mother's excitement. It was all she could explain. She had not heard the "fool's" other long-sounding name, nor could she have remembered it had it been told her.

The wretched woman looked in wild terror at the ribbon for a moment. Then her strength failed, and she fell back with a dreadful cry of—"God pity me, and let me die!" She covered her face with her hands, and sobbed like a child, as she had not done for years before.

Mamie threw her arms about her mother's neck and sobbed with her—"Don't ky, mamma, I love 'ou."

The miserable woman mastered herself by a mighty effort. "Never mind, darling," she gasped, and she soothed the little curly head till Mamie sobbed herself to sleep. There they lay. The little girl slept soundly with her arms about her mother's neck. "I love you," she had said, and it was all her prayer, all her creed. But the woman could not sleep. She lay through the long night, moaning over and over again the only prayer she dared to make, "God pity me and let me die!"

You will remember that we left the minister sitting by the fire in Mrs. McKelvey's kitchen. We feel well disposed towards the melancholy little man and would gladly allow him to remain in that comfortable position. But in order that a truthful narration of the events of this history may be given, we must move him. He sat very patiently in his place for a long time, thinking, no doubt, of his Easter sermon.

Mrs. McKelvey broke the silence at last. "I see ye 'ave a fiddle in yer room, Parson, do 'e play it, sir?"

"Now and then, Mrs. McKelvey—are you fond of music?"

"That I be, sir. Bill an' me is wonderful fond of it. Bill kin tell jest 'ow a tune orter be played. Say, Parson, why couldn't 'e bring out yer fiddle an' play while we does our work. Pears ter me we kin git through sooner."

The Rev. Mr. Grayling did not need any second invitation to go in search of his violin. He came the nearest to perfect happiness when he had his adorable fiddle under his chin. He rose from his seat very readily at Mrs. McKelvey's invitation, and went at once for his musical instrument.

"Now, Bill"—said Mrs. McKelvey, as the door closed behind the minister, "don't 'ye git carried away by no music so that 'e can't peel them pertaters."

Mrs. McKelvey knew that music was as essential to a full development of her husband's nature as salt was to his food.

Mr. McKelvey said never a word. He only grasped his potato knife more firmly, and spread out his feet as if to intimate that the music that transported him for any distance, must be of a captivating nature indeed.

The minister's violin hung from a nail driven in the wall of his room. He took it tenderly down and held it to the light where he examined it carefully. I wish for the sake of romance I could say that it was one of those rare old instruments with a history that reads like a novel. I am writing from the facts, however, and truth compels me to say that the Rev. Mr. Grayling's fiddle was a poor, cheap affair such as one could buy in any music store. But if it had been made of gold, the "fool" could not have handled it more tenderly. He carried it very carefully back to the kitchen, and resumed his old seat by the stove.

The Rev. H. A. S. Grayling A, B. etc., with nothing but his Easter sermon to think of, and the same gentleman, with his violin in hand, were two different persons, strange as the idea may seem. The little man looked almost happy as he sat by the stove the second time. From somewhere down in the pockets of his dangling coat, he pulled a faded silk handkerchief, and placed it under his chin as a rest for the violin. Then with half-closed eyes, and head slightly rocking, he drew his bow over the strings of the instrument.

Either the fiddle was very much out of tune, or else the minister possessed a highly cultivated ear, as for nearly ten minutes he did nothing but tune the instrument till it really seemed, as Jack Gray called it, "a box of aggerny." First he would tighten a string and then let it out, only to go through the same performance a dozen times.

It must indeed have been a most monotonous entertainment for Mr. and Mrs. McKelvey, but they said nothing, evidently buoyed up by the thought that a most remarkable musical treat was sure to follow such a careful preparation. The "fool" himself seemed to enjoy it thoroughly, so it was not all lost.

Mr. McKelvey, the great musical critic, the man who knew "jest how a tune orter be played" watched the parson carefully, though he did not for a moment neglect his work. If he could have expressed his thoughts without attracting the attention of the entire neighborhood, they would probably have been about as follows—"'E kin jerk a good bow, an' do a clean job, when 'e gits ready."

But, sad as it may seem, Mr. McKelvey and his wife were not to listen to the minister's solo. Just as the parson finished his tuning, in fact he had risen to his feet and turned his back upon the audience, the kitchen door opened and Jim Foster walked in.

Had it been any one else, I actually believe the McKelveys would have risen, voice and all, to drive the intruder away. But Jim Foster was a particular favorite with the boarding-house couple, for he had actually made the statement, before a large company, that "McKelvey's kid tuck the cake away from any kid he ever see."

Now I will put it fairly to any of my readers. If a man of Jim Foster's experience and observation should make such a remark about *your* baby, would you say one word if he interrupted the best musical entertainment you ever attended? Not at all; you would smile on him as sweetly as did the McKelvies, and pretend that you were delighted to see him, hoping all the time he had some new compliment for the small specimen of humanity in the cradle

"Good evenin', mum and Parson How are ye Bill?" was Mr. Foster's salutation. Jim did not really have any particular solicitude for the state of Mr. McKelvey's health, but I think he wished to recognize the fact that he considered Mrs. McKelvey and the Parson, in a certain sense, superior to their companion.

Mr. McKelvey nodded, Mrs. McKelvey smiled, and the minister after some little hesitation, put down his violin, and resumed his seat.

Jim came to business at once. "Could I see ye outside fer a minnit, Mis'. McKelvey?"—he said with a wink in the direction of the minister, as if to indicate that the proposed interview would concern that individual.

(TO BE CONTINUED.)

"EDITOR'S BACK STAIRS."

THE INTERESTING VIEW OF THE LATE DR. J. G. HOLLAND.

The columns of the newspapers appear to be flooded with proprietary medicine advertisements. As we cast our eyes over them, it brings to mind an article that was published by the late Dr. Holland in *Scribner's Monthly*. He says: "Nevertheless, it is a fact that many of the best proprietary medicines of the day were more successful than many physicians, and most of them, it should be remembered, were at first discovered or used in actual medical practice. When, however, any shrewd person, knowing their virtue, and foreseeing their popularity, secures and advertises them, then, in the opinion of the bigoted, all virtue went out of them."

Is not this absurd?

This great man appreciated the real merits of popular remedies, and the absurdity of those that derided them because public attention was called to the article and the evidence of their cures. If the most noted physician should announce that he had made a study of any certain organ or disease of the body, or make his sign larger than the code size, though he may have practised medicine and been a leader in all medical counsels, notwithstanding all this, if he should presume to advertise and decline to give his discovery to the public, he would be pronounced a quack and a humbug, although he may have spent his entire life and all his available funds in perfecting his investigations.

Again we say "absurd."

If an ulcer is found upon one's arm, and is cured by some dear soul of a grandmother, outside of the code, it will be pronounced by the medical profession an ulcer of little importance. But if treated under the code, causing sleepless nights for a month, with the scientific treatment, viz., plasters, washes, dosing with morphine, arsenic and other vile substances, given to prevent blood poisoning or deaden pain, and yet the ulcer becomes malignant, and amputation is made necessary at last, to save life, yet all done according to the "isms" of the medical code, this is much more gratifying to the medical profession, and adds more dignity to that distinguished order than to be cured by the dear old grandmother's remedy.

This appears like a severe arraignment, yet we believe that it expresses the true standing of the medical profession in regard to remedies discovered outside of their special "isms" One of the most perplexing things of the day is the popularity of certain remedies, especially Warner's safe cure, which we find for sale everywhere. The physician of the highest standing is ready to concede its merits and sustain the theories the proprietors have made—that is, that it benefits in most of the ailments of the human system because it assists in putting the kidneys in proper condition, thereby aiding in throwing off the impurities of the blood, while others with less honesty and experience deride, and are willing to see their patient die scientifically, and according to the code, rather than have him cured by this great remedy.

Yet we notice that the popularity of the medicine continues to grow year by year. The discoverer comes boldly before the people with its merits, and proclaims them from door to door in our opinion much more honorably than the physician who, perchance, may secure a patient from some catastrophe, and is permitted to set a bone of an arm or a finger, which he does with great dignity, yet very soon after takes the liberty to climb the editor's back stairs at 2 o'clock in the morning to have it announced in the morning paper that "Dr. So-and-so was in attendance," thus securing for his benefit a beautiful and free advertisement.

We shall leave it to our readers to say which is the wiser and more honorable.

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:
"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:
"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:
"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:
"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:
"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:
"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Josepn Harris, Moreton Farm, N. Y.:
"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined."

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

PRECAUTIONS IN BUYING LAND.

L. T. S., Des Moines, Iowa.—For some years I did office work in Chicago; but am going to buy a farm if I can find a suitable one at a fair price. I have had no experience whatever in making investments in land; what precautions should I take to secure a valid title?

ANS. This is a very important subject, for carelessness in the purchase of land is a fruitful source of expensive litigation and serious loss. A title to land may be obtained by Government grant, judicial decree, inheritance, will, deed, or by long-continued open, notorious, peaceable and uninterrupted possession under a claim of ownership. As a title may pass by judicial decree or may become involved or clouded without such decree, a purchaser who looks no further than the registry of deeds may learn an expensive lesson. To all appearances there, the title may be perfect; yet the town records may show an attachment; the court records may show that a judgment against the land has been rendered, while the records of the court of equity may show that a conveyance has been ordered to enforce a bond for a deed, or to annul a deed obtained by fraud or mistake, or the owner may have become bail for a friend before any one of 50 justices of the peace, and although it may be impossible to obtain any record of it, it will constitute, in some States, a lien upon the property, and, finally, back of all and superior to all, there may be liens for betterments and unpaid taxes. When one contemplates buying land the ownership of which is claimed by inheritance or under a will, it would be prudent for the would-be purchaser to cause an examination of the records of the probate, surrogate or orphans' court—the court, whatever its local name, where estates are settled. If there is no will, no disputed claims against the estate, and no minor or other person under disability interested in it, the purchaser should see that all debts and liabilities of the deceased have been provided for, and that his grantor has taken sufficient deeds from all persons interested. Still he will have to run the risk that a will may yet be found. If the estate has been settled in regular form, he will be aided in his investigations by the records, and ordinarily claims of creditors not presented within a reasonable time, will be barred, freeing the land as to them. Whether there is any will or not, the intending purchaser should investigate whether there is any hostile interest in the land on the part of any widow, widower, heir, legatee, or other person, especially one under disability and not represented. If there is a will, it must be examined to see that it is valid upon its face. Unless it has been duly proved and the time for appeal has expired, it may be well to ascertain whether any suspicious circumstances, such as mental feebleness, insanity, or undue influence, attended its execution. If the testator leaves children, born or unborn, or decendants of a deceased child, and they are not mentioned or referred to in the will, they will have an interest in the land, which the purchaser must take into account. A child born after its father's death has the same rights as another, and, like any minor, may have until he is 41 years old—till he is of age and 20 years more—to assert his rights. The above are the chief precautions which a person about to purchase land ought to take to secure a valid title to it.

TAXABILITY OF WESTERN MORTGAGES HELD IN CONN.

L. T., Westfield, Conn.—Are Western farm mortgages held by persons living in this State taxable? I claim that taxes on the property are paid there, and that persons holding mortgages on such property should not be taxed here on account of their mortgages.

ANS.—Yes; Western farm mortgages owned by citizens of Connecticut are taxable in that State. Section 3,830 of the Revised Statutes provides that "the list of any person need not include any property situated in another State when it can be made satisfactorily to appear to the assessors that the same is fully assessed and taxed in such State to any party, or out of this State as money at interest." This whole question arose in the case of Kirtland *vs.* Hotchkiss (42 Conn., 435), in which the decision was that "debts due to a citizen of this State from a citizen of another State for money loaned there and secured by a trust deed of land therein, on which land the debtor is to pay full taxes without abatement for the debt, are taxable against the creditor in this State."

A FEE SIMPLE.

L. T. M., Matoon, Ill.—What is the real meaning of a "fee simple" in land?

ANS.—A fee simple is an estate of inheritance belonging to the owner, and transmissible to his heirs, absolutely and simply, without condition attached to the tenure. It is the largest possible estate which one can have in land. It is a pure inheritance clear of any qualification or condition, and it gives a right of succession to all the heirs generally. It is when lands are given to a man and his heirs absolutely without any end to or limitation on the estate. Every restraint upon alienation is inconsistent with the nature of a fee simple; and if a partial restraint be annexed to a fee as, for example, a condition not to alienate or transfer the land for a limited time, or not to a particular person, it ceases to be a fee simple, and becomes a fee subject to a condition.

FEES OF EXECUTORS.

S. T. M., Albany, N. Y.—In reading over a law case the other day, I learned that the fees of an executor amount to five per cent. on all sums not exceeding $1,000, 2½ per cent. on sums between $1,000, and $10,000, and one per cent. on all amounts above $10,000. If there are two executors, does each get the above percentage, or is it divided between them?

ANS.—The old rule was to allow only one commission and divide it between them according to the services each had rendered; but a later act provides that when the personal estate is not less than $100,000 over and above all indebtedness, each executor, if there are not more than three, shall be entitled to the full amount of compensation he would have received if he had been the sole executor.

INJURY TO TRESPASSERS FROM VICIOUS ANIMALS.

A. F. B., Catskill, N. Y.—In spite of notices to the contrary, people persist in taking "short-cuts" through my farm; should my bull injure one of them would I be liable for damages?

ANS.—No; unless the animal was known to be vicious. Any person who keeps a domestic animal, which to his knowledge is of a ferocious, or mischievous disposition, is bound to restrain it at his peril, and if it escapes and does damage, the owner is liable for the injury committed, even though it resulted from the carelessness of the person injured, or he was a trespasser, if his own negligence did not contribute to the injury.

R. W. L., Salem, Ind.—A sells his farm to B and gives him a good and sufficient deed therefor. He remains in possession, however, for over six months, as B lived in another State and wasn't ready to move at once. By the carelessness of another—a member of B's family—no official record of the transfer of the farm was made, and A, learning this, sold the farm to C and went to some place unknown. C bought the place, so he insists, in good faith, though at a considerably lower price than that paid by B, and for less than it was really worth, and he recorded his deed at once. B now finds that his deed is held to be worthless; has he any redress?

ANS. No; unless he can find A, or prove that B knew of the previous sale of the farm when he purchased it from A.

L. S., Worcester, Mass.—1. Is a wire fence a legal fence in this State? 2. What is a legal rail fence here?

ANS. 1. Yes. 2. One 4½ feet high.

THE POST OFFICE CLUB.

THE parrot received strong support the other night. It seemed to do him good, for he has brightened up considerably since then. The support came from a man from Gloomville. That is a pretty dreary place. Nothing goes right over there. Everybody seems blue and discouraged all the time. People in Gloomville are never happy; they brood and fret and worry. It is very different from the way they do business in Sunnyvale, on the other side of our valley. In Sunnyvale people are bright and cheerful. Farming pays over there because they count happiness at its proper price per pound. It gives one a feeling of rest to ride through Sunnyvale, while it makes one tired to go near Gloomville.

Our friend from Gloomville stood near the stove as the parrot crawled out of his box. I don't think his boots had ever been polished. I am sure his hat had never had a brush rubbed over it. He was a hard-looking customer. It was so long since he had tried to brush up and look like somebody, that he had forgotten how people appear when they are happy and contented. The parrot picked this individual out as a man after his own heart. He crawled up on the stove-pipe, scratched his beak with his claw and croaked:

"Farmin' don't pay!" Our friend from Gloomville was interested at once. "You're right, it don't," he briskly said. "There ain't nothin' into it but work an' no profits. The harder ye work the more these big Trusts an' monopolies make, an' the less we git. I'm ready to quit workin' sos't somebody else kin make money. Taxes and tariffs is jest eatin' us all up, an' yet there ain't nothin' right. Roads ain't good fer nothin', folks we 'lect ter office don't do nothin' but steal, an' folks in town don't do nothin but set down an' make money outer the farmers. I'm jest ez good ez they be, but they're so stuck up I don't git no show. Prices is low, season's bad, help skerce—ain't nothin' right. Farmin's a dog's life an' don't pay nobody." And the parrot almost screamed for joy as it broke in with

"Farmin' don't pay!"

I wouldn't be at all surprised if the bird moved over to Gloomville so as to be nearer his real friends. SMALL PICA.

Trees, Seeds and Plants.

SEED POTATOES.
Northern grown; two of the best kinds in the world. Write for prices.
C. L. FULLER, South Berlin, Rens. Co., N. Y.

CHARIOT RACE FROM BEN-HUR.

A REALISTIC representation, beautifully engraved upon a handsome 1889 calendar, by John A. Lowell & Co., Boston, can be procured by sending six cents in stamps to P. S. EUSTIS, General Passenger and Ticket Agent, C., B. & Q. R. R., Chicago, Ill.

SPRAYING FRUIT TREES to destroy injurious insects is recommended by all experienced Horticulturists and by this system only can perfect fruit be secured. For full directions and outfit for hand or horse power, address FIELD FORCE PUMP CO. Lockport, N. Y.

BIG BUCKEYE FIELD CORN. **NEW TOMATOES** Our illustrated Annual of Tested SEEDS, BULBS, TOOLS, &c., mailed free to all seed buyers. Two Colored Plates. Tone, Touch, Workmanship and Durability.

WILLIAM KNABE & CO.,

BALTIMORE, 22 and 24 East Baltimore STREET. NEW YORK, 112 Fifth Av. WASHINGTON, 817 Market Space

1,076.

The Rural New-Yorker's seedling potato, No. 2, will be sent to all yearly subscribers without charge. It yielded in the late celebrated "Potato Contest" at the rate of 1,076 bushels to the acre, the report being sworn to by six well-known judges. This seedling is thought to be the nearest approach to a perfect potato yet produced. The price of the Rural New-Yorker is $2.00 a year. It will be sent on a trial trip of 10 weeks for 25 cents in order to show progressive farmers, who do not now read it, that it is the best farm weekly in the world. "It has done more to promote the interests of agriculture in its experiment grounds than all the experiment stations put together." So say the editors of the N. Y. Times, Tribune, World, Farm Journal, Inter-Ocean, etc; so say all who read it and know. It is pure, sparkling and original. Its illustrations are from nature. It commands the best writers in the world. Subscribe at once. Address the Rural New-Yorker, 34 Park Row, N. Y.

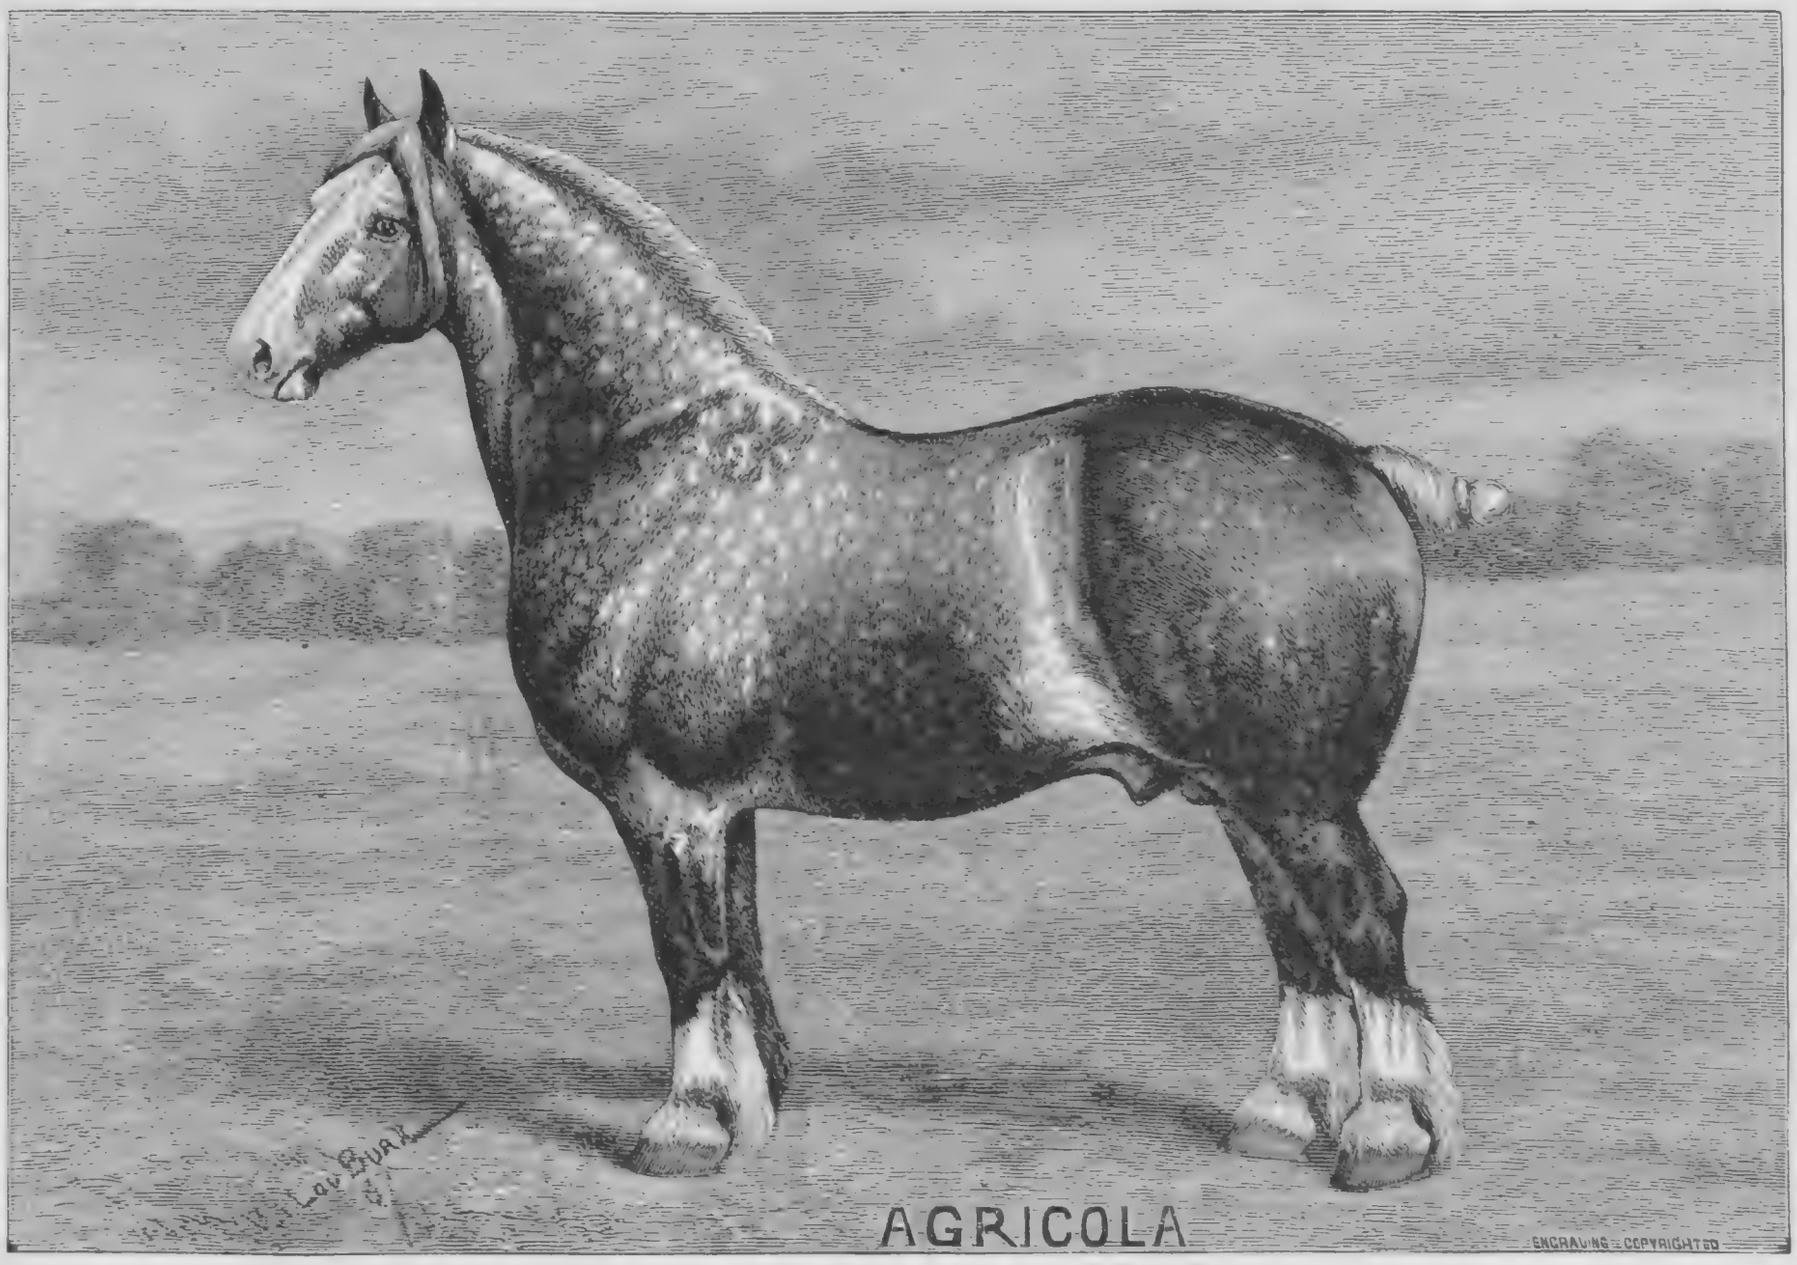
Horseman.

SHIRE HORSE, AGRICOLA.

HIS excellent English Shire stallion is owned by Messrs. Galbraith Bros., of Janesville, Wis. He is a noble specimen of this famous breed, which is becoming very popular on this side of the Atlantic. That Agricola ranks among the very best of the breed, is shown by the following record: "Agricola has won, among other prizes, first at the Royal Manchester and Liverpool Show in 1882; first and champion over all ages at the same show in 1883; first at the Lancaster Spring Stallion Show; first at Leyland; first at Nelson, and first at Skipton, all in 1886. In 1887 he won first at Ormskirk Spring Stallion Show, third at the Royal Society's Show at New Castle; first at Ormskirk, Southport, and Bootle Shows, and champion prize for best stallion in the show-yard. He has been exhibited only twice in America, viz: at the American Horse Shows of 1887 and 1888. In the former year, his stable companion, Caractacus, won first, the well known Holland Major second, and Agricola third. At the last show, however, Agricola turned the tables on Holland Major by winning first place in the strongest class of Shire horses ever seen in America."

A picture of Agricola is shown at Fig. 9.



ENGLISH SHIRE STALLION, AGRICOLA. Fig. 9.

Floricultural.

THE ROSE FRANCOIS MICHELON.

(*See page* 34.)

JUST as among men there are always some few who tower head and shoulders above their fellows, whether physically, intellectually, or morally, and are universally considered "great men," so among roses there are some varieties whose claims to be accepted as "great roses" are undisputed. Moreover, as in the world of men, although there are plenty of good and useful, not to say indispensable, members of the community, the number of really great men is small, so in proportion to the infinity of beautiful roses in cultivation the really great roses, such as General Jaqueminot, Charles Lefebvre, Marie Baumann, Alfred Colomb, La France, Baroness Rothschild, Louis Van Houtte, Marquise de Castellane, A. K. Williams, Madame Gabriel Luizet and Ulrich Brunner, are by no means numerous.

So writes our esteemed contemporary, the London Garden, from which our portrait of the rose, François Michelon, is re-engraved—see Fig. 7. This rose is no less esteemed here than in England. In the list of really great roses, it must be admitted that this is well entitled to a place. It was produced by Levet in 1871, a seedling of La Reine. The color is a dark rose, tinted with lilac. It is of large size, very full and of globular form. It is fragrant and free-blooming. The habit of the plant is upright; the thorns are not numerous. In England it rarely blooms in the fall. In this country it blooms as well in the fall as any of the hybrid remontants, while it continues to bloom later in the summer.

Farm Economy.

A NEW FERTILIZER.

EXTRAORDINARY results are reported from the use of sulphate of iron, or the common copperas of commerce, when it is used in connection with the potash and phosphate fertilizers. The Marquis of Paris, who is more of a successful fruit-grower than a nobleman, and more of an extensive market gardener than either, has been the first to recommend and employ it extensively. His practice is, after applying other fertilizers, to sow copperas at the rate of about one ounce to the square yard of surface, for all garden crops, and for tree and shrub fruits as well, and he reports very good results. Not long ago, a scientist of some reputation experimented with copperas, and came to about the same conclusions; but as these experiments were conducted on the usual minimum scale, nothing valuable was established and nothing came of it, because it has come to be recognized by practical men that the personal force and belief of the experimenters provoke the wished-for results. But in the case of the Marquis-gardener, the beneficial influence of copperas when used in connection with other fertilizers was demonstrated, and the fact will be accepted and adopted by his professional brethren. In the relations of these circumstances our scientific agriculturists may perhaps read a useful lesson, and to this effect: that if the average farmer and fruit-grower suspects the integrity of unusual results obtained on a minimum scale, and perhaps rejects their teachings altogether, he at once takes off his hat and pays the tribute of respect to acres of successful demonstration.

B. F. J.

[Our friend may not be aware that the R. N.-Y. has made four experiments in the use of sulphate of iron on corn and potatoes. The yield was less in every case where the copperas was used.—EDS.]

THREE-HORSE POLE.

(*See page* 35.)

MR. TERRY'S recent statement of the advantages of a three-horse pole has called out several letters from those who desire to know how such an arrangement can be fitted to the wagon. At Fig. 8 we show a form much employed on heavy wagons in this city.

Horticultural.

POTATOES FOR SEED.

WM. FALCONER.

THERE is a general impression among farmers and gardeners hereabout that potatoes raised by ourselves are not as good for seed as are those raised in Maine or Nova Scotia, and a large business is done here in potatoes grown far north. My own experience is in favor of Maine seed potatoes; but this is because I do not grow potatoes purposely for seed. Still, in the case of our earliest potatoes, I have to use home-grown seed, because I expect to have our earliest potatoes planted before the ice in the Maine harbors has broken up enough to admit of shipping the potatoes from there. True, this can be overcome by getting our seed potatoes in the fall instead of in the spring. At the same time it is a well known fact that some of our truck farmers always grow their own seed potatoes. Mr. Hallock, of Suffolk Co., who grows Early Ohio in large quantity for the Boston market tells me that he always selects, saves, and grows his own seed, and prefers it to any that he can get anywhere else. Mr. Abram Van Sicklin, of Jamaica, Queens Co., who is one of the largest and most successful truck gardeners around New York, saves his own potatoes for seed; but he tells me "there is a point or two in this potato seed business not generally known." He plants his potatoes that are to be reserved for seed very late; this year it was the second week of June before he planted them. The potatoes from these late plantings don't average as large tubers, or as heavy a crop as those from earlier plantings; but they don't sprout in winter as do tubers saved over from early plantings. These last have to be sprouted once or maybe twice during winter; hence they are deteriorated to a considerable extent for use as seed, for the first sprout is always the best, and makes the healthiest and most prolific plant. But the tubers from the late plantings, like the Maine-grown potatoes, if properly kept, do not sprout in winter; hence when planted out their growth is first-sprout growth with its advantages. Mr. Van Sicklin tells me that no matter how good a white-skinned potato may be, his customers

don't care about it; marketmen have a decided prejudice against such potatoes, especially in the case of early ones. The Early Rose and other pink-skinned potatoes always sell best; but late in the year, when potatoes are plentiful from all quarters, the objection to white-skinned potatoes is not so marked.

LIME

AS A "SOIL IMPROVER."

How Does It Set Plant Food Free?

A POPULAR FANCY.

Folly To Use It Alone.

DOES IT MAKE THE FATHER RICH?

DOES THE SON GROW POOR?

FROM T. H. HOSKINS, M. D.

The RURAL refers to me, for reply, the following request from an Illinois subscriber: "*I would like to hear from those who have had experience in the use of lime for the purpose of increasing fertility. What quantity per acre? Slaked or unslaked? It seems to me that this black prairie soil has abundance of fertility, but that it needs to be set free.*"

It has become a pretty well established fact that lime is not a necessary substance to apply to the land for the purpose of directly nourishing the crop. Few, if any agricultural lands lack lime enough to feed a long succession of crops; while not only chemical fertilizers, but stable-manures contain much more than the necessary quantity of lime, in proportion to their other components. We must look, therefore, in some other direction for an explanation of the well-known practical fact that lime is a great amelioration to *some*, yet not to *all* soils. Through the older parts of New England, no benefit seems to be derived from it, with the single exception that it often proves of great benefit "to liven up the soil" of old, over-manured gardens, which has become "sour," and is in any way out of condition, and which is the habitation of vast numbers of injurious insects, worms, snails, etc. But it is not to be supposed that, because this is the experience of the farmers of the older settled parts of New England, lime may not eventually be useful on much New England soil, especially in the rich valleys away from the coast. I believe that in the Champlain Valley lime is sometimes found a very useful application.

On the black prairie soil of the middle West, which has had its virgin productiveness skimmed out in a long succession of grain crops, there is a good chance that liming may be of some temporary advantage, though this can be, and has been, carried to excess on similar soils—such overlimed soils losing the cohesion necessary to afford support to the roots of crops, and to retain moisture. Liming has had the most marked success in America, on the long-farmed lands of Eastern Maryland and Virginia, and lime, in connection with green sand-marl, which is rich in potash, has been of great benefit to that region. Yet it is only as a temporary and auxiliary practice, in connection with other processes of renewal, that such treatment is found satisfactory over a long series of years.

Unquestionably, one chief effect of lime is upon the physical condition of soils, and this effect may be beneficial or injurious on the same soil at different times, as well as upon different soils. It has some chemical effects of benefit under peculiar conditions, such as in the over-dunged gardens above referred to, and also upon land injured by the presence of a large quantity of sulphuret of iron. What it is, exactly, that lime does to a soil, where it benefits it, has been difficult to determine, and undoubtedly the best exposition of the present state of our knowledge upon the subject is to be found in Professor F. H. Storer's "Agriculture," Vol. 2, p. 139, *et seq.* I cannot undertake to give, with any considerable fullness, what is there stated; but it may be said, briefly, that lime increases the porosity of a too compact soil, thus permitting the elevation of nutritive matters from the subsoil by capillary attraction, as well as furnishing minute passages for the fine roots downward. Lime has also a tendency to cause the finest particles of fine soils to unite with coarser granules, in this way greatly improving the texture of clays, and of fine loams, such as would naturally be too muddy and cohesive. This is the character of much prairie soil, especially of the magnesian wheat lands of Illinois, which tend to become puddled by cultivation, and thus impervious to water, either in its downward course in wet weather, or its upward course when the season is dry. These very fine soils are extremely difficult to manage, especially after they have been long under tillage, on account of this tendency to become puddled. The use of lime to cure this condition is an important one.

Lime is believed to have a direct chemical effect upon the soil, by uniting with the hydrous silicates, so as to expel from them potash, ammonia, or magnesia, for the use of crops. But for this purpose the sulphate of lime (land plaster) is more effective than quicklime. I have already referred to the action of quicklime in hastening the decomposition of humus. In doing this, which is called by practical gardeners "sweetening the soil," the lime releases much inert nitrogen, and makes it available for the nutrition of crops. Recently drained bogs or "muck beds," are thus greatly benefited by a free dressing of lime, which hastens the putrefactive process, quickly converting the cold muck into a warm and productive seed-bed for crops. But still another action takes place in soils rich in vegetable matter, under right conditions of temperature, moisture and aëration, whereby an application of quicklime may greatly favor the formation of nitrates. The nitrifying ferment "prospers exceedingly" in presence of a sufficient quantity of carbonate of lime, and, indeed, will hardly do good work without it.

As to the quantity of lime to apply, it has been reckoned that about 150 bushels per acre is as much as is necessary for a first application, except upon very cold clays, when as much as 250 bushels have been used with profit.

Subsequently, lighter dressings, at intervals of seven to 12 years, may be used; but the apparent benefit lessens, and will finally cease, unless the land is faithfully and intelligently managed otherwise. It is utter folly to depend upon lime, because it has had a wonderfully good effect at the first application. The common practice is to draw out the fresh lime, as it comes from the kiln, and distribute it in little piles of a bushel or less, evenly over the field. A little depression is made in the soil to receive it, and the pile is then covered lightly with earth and left until it has fallen to a powdered condition, when it is distributed upon the surface as evenly as possible, and worked into the soil.

In some parts of the country, where stone lime is not to be found, there are often deposits of calcareous marl, which may be made to answer a good purpose; and along the sea-shore marine shells make excellent agricultural lime, when burned. Leached ashes act in much the same way, besides supplying considerable plant food. It should be added that it is vain to apply lime to land with the hope of profit, unless the land is naturally good. A barren soil can never be helped by liming.

Orleans Co., Vt.

THE ROSE FRANCOIS MICHELON.

After the London Garden. Fig. 7. See Page 33.

FROM PROF. J. W. SANBORN.

I have used lime on a soil not as rich as described by your Illinois correspondent, and observed something of its effect. I have avoided its use, except in an experimental way, save a considerable quantity used on a granite soil. In the latter case, it was used as a top-dressing for grass without satisfactory results. I have avoided lime for the reason that I have never been willing to farm at the expense of old age or of the next generation. Lime acts as a soil disintegrater, and does not add fertility, as your subscriber implies, except in very rare soils. Anything that acts as an agent of soil decomposition, and which in this way makes available as plant food matters already in the soil is desirable, especially if stock on the farm are fed on the resulting products, and the manure is returned to the soil. If the crop is sold from the farm, then soil impoverishment is only hastened. This process of liming may temporarily pay, but it is at the expense of the future, while we pay for the agent that does this permanent mischief.

I have preferred to pay more to secure a fertilizer that acts both chemically on the soil and as a direct source of plant food. I would not be understood as saying that in the hands of a prudent man lime is not a useful and profitable agent in securing an increase of crops; but that it is dangerous when used by a farmer who uses it under the belief that it adds just so much fertility to the soil. The one will feed the crops raised to his stock as well as use the lime in moderate amounts; the other will sell his crops in this part of the country under the short-lived delusion that liming is sure to furnish continuous crops.

The black prairie soil is one rich in vegetable matter and most likely to respond safely to the use of lime, provided it is used in moderate quantities. Its excessive use would result in too free liberation of nitrogen from its insoluble compounds, and its consequent loss, either by leaching or volatilization. Any tendency to acidity in such soils, which is liable to exist where they are undrained and rest on impervious subsoils, would be corrected. From 100 bushels to much larger amounts of lime have been used in the past, but now that its character is better known, it is used more sparingly, or from 100 bushels downward. Where it is used to correct the physical character of the soil through its action on clays, both mechanically and chemically, large amounts are needed, in a relative sense. On the soils described by the Illinois inquirer, I would use only moderate amounts, but I would make such applications more frequently than has been common. I used 300 pounds per acre and increased the crop nearly 100 per cent. as an average of two years' trial. The third year, 1888, the difference was in favor of the lime, but there was not so heavy a gain. The year was too good a corn year to show great differences. The lime was used in an air-slaked condition. It should be allowed to slake in order to have a fine material for distribution. A larger quantity than was used by me, may be used yearly with safety, and it is better not to use large quantities at longer intervals. It is better to use small amounts every year rather than get a severe action of it on the vegetable matter faster than crops can utilize the product.

Columbia, Mo.

FROM E. DAVENPORT.

One can scarcely ask a man a tougher question than whether or not to use lime in the soil of a particular locality, and the only answer I am willing to give, is "Try it on a small scale and see." I am aware that this is cold comfort to one who seeks advice; but opinions and theories are so varied, soils and climate are so diverse, and, withal, the action of lime is so little understood, that it is decidedly unsafe to reason from the experience of one as to the results with another.

Many of the effects of lime upon the soil are well understood, and a long paper might be written upon the subject: but I do not suppose that is what the Illinois inquirer wants. If I were in his situation, I would apply lime in considerable quantities to a small area, and watch the result very carefully; and while awaiting development, to the end of forming an intelligent opinion, I would study some such works as Storer's Agriculture, which is well up on the subject, and gives the latest facts known. I would use marl if near at hand; and if it is not, I would use burned lime which should be slaked before it is applied. Besides removing half the weight, burning is the cheapest way to reduce it to a powder. Marl will, as a rule, fall down well by the action of the weather.

It must be borne in mind that lime is in no sense a manure. While it is an indespensable ingredient of plants, there are few soils that do not contain more than is sufficient for this purpose. Its action is, to say the least, mainly corrective, and it should be applied for this purpose and not as plant food; that is, in quantities expressed in tons, rather than as a fertilizer in pounds. I would try two or three tons to the acre, bearing in mind the old adage—"Lime enriches the father, but impoverishes the son."

FROM FRED GRUNDY.

I never have tried lime on our black soil for the purpose of increasing fertility, nor can I learn of any person who has. The character of the water in shallow wells plainly indicates that there is an abundance of lime in the soil; but whether it is near enough to the surface to be available as a liberator of fertility I am unable to say. Much of our black soil is heavy and inclined to be wet, and, until it is thoroughly under-drained, the immense quantities of plant food it contains are not available to any great extent. Underdraining loosens this heavy soil, rendering it porous and friable. Plants send their roots deeper and tap the vast stores of fertility in the subsoil, and for some years the crops are as heavy as when the land was first plowed. For four or five years after this prairie soi

was first broken up, it remained very light and porous, and enormous crops were grown upon it. But as the old grass roots decayed and disappeared, the soil seemed to run together and pack like clay. If tramped or worked in the spring while a little wet, it becomes so hard and cloddy when it dries, that nothing can be done with it until late in the summer. If worked at just the right time, when neither too wet nor too dry, it will remain fairly friable through most of the season. Underdraining and clover bring it into a condition similar to that of newly broken prairie, and seem to renew its strength completely; and I am satisfied that neither lime, sand, nor anything else of that sort will accomplish a like result. Our black soil is rich in fertility, and, if treated properly, it will grow immense crops of cereals for years and years; but it will resent ill-treatment almost as emphatically as a Jersey cow.

Christian Co., Ill.

FROM F. S. WHITE.

From what little experience I have had with lime, I am satisfied that it would be very beneficial on some soils and for some crops. If I had a heavy clay soil and wanted to grow corn, wheat, oats, or a crop of cabbage, I would use air-slaked lime freely, and I would also use it on a sandy soil for the same crops. I have always thought that our black, rich soil of the West had lime enough in it for all crops. I am sure we do not need to apply lime here yet, except on such soils as I have mentioned. Lime applied to plants has a very drying influence, and it should be used sparingly, and if it is applied to the soil it would seem that more could be used in a wet than in a dry season. I have used lime several seasons in my cabbage ground, and I find it slow to mix with the soil here. Different soils and different localities would show different results, so I think the advisability of using lime is a question to be settled by practical experiment. The cost of lime is another question to be considered. We could not afford to use it here, unless the prices of our crops were higher.

Polk Co., Iowa.

FROM J. W. INGRAM.

Scarcely any lime is used on the land in Northern Pennsylvania, on account of the great distance it would have to be brought and the cost of its transportation. There are but few limestone rocks to be found in this part of the State, and these are composed chiefly of innumerable small shells cemented together, the shells containing all the lime. When burned, the lime has considerable strength, and is called "gray lime." In the southern part of the State, where I have frequently traveled, and especially in Dauphin and Lancaster counties, immense quantities of white lime are used on the land to increase the crops. It is drawn from the kiln and put on the fields in piles nearly as large and as close together as ordinary manure piles, and afterwards these are evenly spread over the ground and harrowed in. I was told that lime was a benefit to all crops, but more especially to wheat and the other cereals, making the straw brighter and stiffer, and causing a larger yield of plumper grain. In my opinion, an application of caustic lime to the raw prairie soils of the West, although it would be of no benefit to corn, would put the land into a more favorable condition for raising wheat and oats.

Bradford Co., Pa.

Rural Topics.

SUGGESTED BY A PICTURE.

T. B. TERRY.

The wife's rightful position; the curse on Eve not indefinitely transmissible; man's natural tendency to domineer; a true helpmate; give the wife the keys of the safe as well as those of the kitchen; legal injustice to wives; the "dower" insufficient; man and wife full partners; inconsiderate and niggardly husbands; no better time for reform in domestic relations than just now.

THE picture on the first page of the Thanksgiving Number of the RURAL pleased us greatly. We looked at it long and earnestly, and repeated the "True Thanksgiving Song" with full hearts. But, after a time, there came a feeling that something was not quite right about the picture. It seemed to leave an impression on the mind that wasn't quite satisfactory. At last, a passage of scripture was recalled, that made all plain—"And he shall rule over thee."

That one command of his Maker, man has rarely failed to obey. The man in the picture seems to take to it naturally. His position shows it; the way he grasps that ear of corn would convince any one. Oh! dear RURAL, when you had such a good chance to make a man take his rightful position for once, and acknowledge the full partnership with his help-mate, why didn't you do it? Why didn't you put the sharer of all his joys and sorrows by the lord's side, with his arm around her, even if he didn't beat time quite so accurately for the creatures below?

To be sure the Creator did lay a curse on Eve; but I know you do not believe that it was intended that it should stay on women for all time. They have certainly been punished enough. It would be un-Godlike, unmanly, to keep that curse forever hanging over them. It has been already largely removed. What has done it? Christianity. It must be right, then. Let the good work go on until woman is acknowledged in every respect the equal of man, and his full partner in life, as the great Creator undoubtedly intended in the beginning she should be.

But how easy it is to fall into this "rule-over-thee" way. Come to think it over, I must plead guilty myself. In all I have ever written for the papers, I do not remember that I have given my partner one bit of credit for what we have accomplished. No, I have taken it all on my own lordly shoulders. And still for nearly a quarter of a century we have worked hard together, she doing her full share, if not more. Let us think a little. The first year we came on to the farm, my partner loaded all the hay. We were too poor to hire a man. We had help but one day that year. When I was learning to plow, for I was entirely green at farming, who drove the horses and encouraged me? Who has been ready at any time to help, out-of-doors or in, where she could do the most good, willing to live on little, yea, contented and happy, until we could work our way out? I tell you, friends, it was that blessed wife and partner of mine, and many thousands of you have just such partners; see to it that you acknowledge and treat them as such, and do not play the "lord and master" over them.

The beginning of a New Year is a good time to start an improvement of this kind, where there is need of it. The subject is too broad for one to attempt to go over it all in a newspaper article, so allow me to confine what I may say to two points: First, brother farmer, if you should die this year, would your farm or even half of it go to your wife, who has done as much as you towards earning the money and paying for it? If not, fix that matter to-day. In Ohio, a man and his female partner may work and save for 30 years to pay for a farm. The man dies first, and if there are children the law does not give that poor woman the ownership of one single acre of that farm; she gets simply the right to use one-third of it during her life-time. Think of the terrible injustice this may work. Think before it is too late, if you love your wife, or have any love for justice. Justice demands that you do no less than deed her half of the farm. For myself I have deeded all the farm to my wife, so in no case can she be cheated out of her rights. It is time enough for the property to go to the children when both the original partners are through with it. The wife can will the property back to the husband, or, in Ohio, she can deed it back and he can keep the deed and not put it on record unless she should die first.

In any State the matter can be fixed so as to work injustice to no one, if it is attended to in time. In a few years, it will be safe to leave this matter for the law to settle, as our laws are fast coming to acknowledge man and wife as equal; but until that good time comes, when public sentiment has been worked up to simple justice, we farmers who love our wives and recognize their claims as full business partners, must take it in our own hands. Do it immediately, otherwise you may be to blame for a "dark sorrow that mars" your dear one's next Thanksgiving Day (see last line of the "True Thanksgiving Song.")

The next point is very simple. When two partners are doing business together, should one carry the pocket-book and handle all their joint earnings and savings, and the other, when she wants any, have to ask for it in a begging way? Not much. And still that is about the way many women have to do, and they are thankful when they ask, if they are not met with a harsh refusal. There is a terrible wrong and injustice here. There is but one right course. Have no secrets. Let the wife know at all times just how you, or rather you and she, stand in the world. Consult together about all large expenditures. Have confidence enough in each other's judgment to ask no questions about little amounts. Have the pocket-book as accessible to one partner as to the other. No true woman will ever abuse such a partnership, and there are more true women in this world than there are true men. I am not a woman; but I believe women have the same feelings that we men have, and I do know how grinding it would be for me to have to ask my wife for every dollar I got, even if she always gave it to me graciously.

Last winter, after having talked on this point at a farmers' institute, the writer was taken by the hand by one of the good old mothers of the audience. I knew her husband, and knew him to be one of the richest farmers in Ohio. The good lady said, with eyes full of tears, "Mr. Terry, I do not know that my husband ever positively refused me any money when I asked for it; but," she added, "if there was any way in the world in which I could earn what I want, unbeknown to him, as old as I am, I could do it sooner than to ask for it.'

Oh! friends, there was a terrible injustice there. I do not think it was at all intended on the one side; but it was felt on the other all the same. Was this an isolated case? Well, I have stood before thousands of farmers' wives since then and have told this simple story, and I know from their looks that it is not.

Now, my brother men, will you not see to this point to-day, also? Do not make your dear wife look up to a "lord and master" any more, and meekly beg a few cents of you when she wants them. Do not *give* her a little now and then. That makes her a beggar. Do not *pay* her so much a week or month for her own. That makes her a hired servant. Make her rather a full partner, a free woman, and not a slave. Let her see that her husband is not a master, but a noble man in whose heart justice reigns as well as love.

After I had finished a hard day's work, not long since, my wife said: "How much have you made to-day?" I replied; "It is hard to say exactly; but I believe this day's work may be safely set down at $5." "And I have made $1." she says. "I have done the washing and ironing which I could hire done for $1." "No, my dear", I replied, "you do not put the matter rightly. 'We have made $6. between us,' is the way to put it. We went into partnership 24 years ago; but then you are too modest. Who has got me three nice meals? Who takes care of and makes my home pleasant, thus making it possible for me to do strong and telling work? Who did that washing and ironing herself just because she couldn't hire it done quite nicely enough to suit her? We must pay for the best when we will have it. If you want to charge up your labor to-day, charge $3 and it will be just and fair." Wasn't I right, friends?

Summit Co., O.

Indust'l Societies.

THE HISTORY OF A FARMERS' INSTITUTE.

Large attendance and lively interest in Michigan farmers' institutes; how the Kalamazoo County institute was started; farmers and professors co-operating; the Grange the prime mover; local hospitality to visitors; a farmers' institute by farmers; organization of a county farmers' club; country villages preferred to cities for meetings; principles on which the annual institutes have been conducted.

I NOTICE in a recent issue of the RURAL, a complaint from a correspondent that the farmers of New York do not take proper interest in farmers' institutes which are held for their benefit. He seems to think that when so much pains are taken to supply first-class lecturers, the farmers ought to avail themselves of the opportunity to hear what is said, and learn what is taught. Now I do not know anything about the institutes in New York; but I do know a good deal about those in Michigan, and the complaint suggests the query to my mind: Have they not begun at the wrong end of things there? Are they not trying to heat the mass from the top instead of from the bottom? If so, it may take some time to get it warmed through. It is not so in Michigan. At every farmers' institute the biggest room in town is crowded with farmers and their families, and the greatest interest is manifested. Perhaps a little history of how institutes were started here may be of benefit elsewhere.

Something over a dozen years ago, the State Board of Agriculture provided for a series of six annual institutes, to be held in various parts of the State, under the direction of the professors from the agricultural college at Lansing. Climax is a little village of between 300 and 400 inhabitants at "the corners," in the midst of one of the prettiest little prairies in Southern Michigan, and surrounded by a thriving farming community. At that time it had a Grange, and the Master of the Grange was a graduate of the Michigan Agricultural College. It struck him that Climax would be just the place for a farmers' institute, so he broached the matter to the members of his Grange, and after not a little argument and persuasion, induced them to invite the State Board of Agriculture to assign one of the institutes to Climax. By the use of his influence with the Board, the institute was secured. One of the conditions was that a local committee should make all the necessary local arrangements and provide one half the speakers for the occasion. The Grange, being the only organized body ready to deal with the matter, immediately set to work to make the necessary arrangements. The co-operation of all the citizens in the vicinity was secured. Invitations were extended to the best known and most successful farmers for many miles around to prepare papers on special topics, on which they were known to be well posted. A sufficient number responded to fill the programme. Everybody far and near was invited to attend. The Master of the Grange was chosen presiding officer of the institute. The best music to be had in the vicinity was provided for the occasion. The institute was held in the largest church in the place, which was filled to overflowing. The professors from the college and the farmers mingled together and got acquainted, both performing their part in the programme, the farmers doing their full share in sustaining the interest of the meeting. The institute lasted two days. The people of Climax and vicinity took the visitors home with them, fed and lodged them, and treated them in every way as welcome guests, as they were. The institute was in every respect a grand success.

The next year the same man said to his Grange:

"Let us have another institute this winter."

But they said:

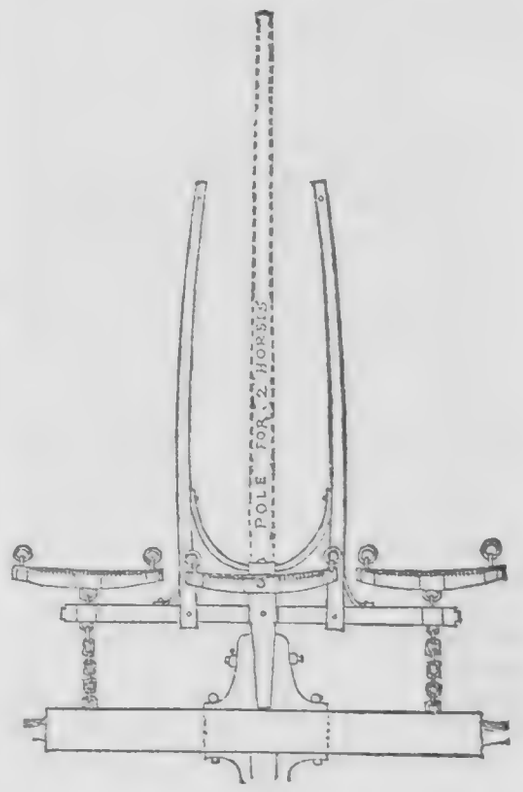
"The State will not give us another one so soon."

"Very well, then, let us have one on our own account."

"But we cannot sustain it alone."

"Yes, we can, I will risk it. It is worth trying anyhow." It was done. Under the same management, and following the same plan, a second institute was held in Climax, quite as interesting and successful as its predecessor. The presiding officer on both occasions urged the formation of a club or organization to continue the institute. At the second one, the organization was effected under the name of the Kalamazoo County Husbandman's Club. It has been a flourishing society from the very start. Its twelfth annual institute will be held the first week in February next, in Richland. The main parts of the papers and discussions have been furnished by the farmers of Kalamazoo county and vicinity. Some help has been obtained from year to year from the professors of the agricultural college. The institutes have all been held in the small villages of the county, in the midst of the farming communities. The city was shunned as not having the right sort of atmosphere and surroundings for such meetings.

Every institute has been "the best one yet." These principles have been at the bottom of the whole business: 1. The institutes have been made the farmers' own meetings which the professors were invited to attend and take part in—not the professors' meetings where the farmers were invited to come and be instructed. 2. They have been held in a congenial atmosphere, with congenial surroundings. 3. Persons coming from a dis-



THREE-HORSE POLE. Fig. 8. (See page 33.)

tance have been made welcome guests by the people in the vicinity where the institutes have been held. Farmers have gone home as visitors with farmers, viewed the farms, stock, buildings and improvements, and thus many pleasant acquaintances, and even friendships have been made. It has not been in any sense a charity. The guests have been welcome ones and many have gone to their homes at night feeling sadly disappointed when there were no visitors left to accompany them, and share their hospitality. I believe the same policy will produce in New York results similar to those which we are all so familiar with here in Kalamazoo county, Michigan. The winter is before us and now is a good time to try this plan if it has not already been done.

F. HODGEMAN.

Dairy Husbandry.

PROFITABLE RESULTS FROM A SMALL DAIRY HERD.

Butter-making as a profitable change from unprofitable grape, potato and fruit growing; satisfactory record of a herd of 14 grade Jerseys; feed; when butter production is most remunerative; growing public taste for new butter; why cows should come in at intervals through the year.

GRAPES are largely produced in the vicinity of Lake Keuka, and potatoes elsewnere in Steuben County bordering on the Conhacton Valley, and both have an excellent market reputation. There is also a respectable show of winter apples which, grown in this elevated region, are noted for their good keeping qualities. The prices prevailing a year ago for these articles were fairly remunerative, particularly those for potatoes, which induced the planting of an increased acreage last spring. With a large yield of each over the whole country, with grapes hunting for buyers at 1½ and two cents per pound in the autumn, with potatoes and apples bringing only 25 cents per bushel at the end of a muddy, weary haul of many miles, there was not found a margin of profit. This unfortunate condition of things raised anew the question whether there is not some other business better adapted to the already worn soil of the region, and less likely to be overdone than so much potato growing—one whose products would be less subject to extreme depression of values, and to which more attention could be profitably given. I refer to the making of a superior quality of butter in larger quantities for which an elevated region, soft spring water, a soil naturally adapted to the growth of grasses, together with constant improvements n methods and machinery for manufacturing the article would seem to furnish all requisites

With a view to comparison, and possibly to strengthen a purpose any one may have formed to modify his system of farming as herein indicated, I give here a carefully compiled record of my small dairy operations for the year 1888, and I believe that as good or better results are easily within reach of many farmers.

Counting as one cow a small two-year-old heifer and an older animal that, owing to a mishap, was in actual use but six of the 52 weeks in the year, the herd numbered 14 head, all grade Jerseys, averaging slightly over three-quarters blood. Parenthetically it may be stated that six of them were three or four years old, all being something short of maturity. The figures given cover an even year—from Jan. 1, 1888, to Jan. 1, 1889

Pounds of butter,	3,960
Per cow,	283
Pounds sold,	3,604
Family supply,	356
The average price was 25.6 cents per pound, so that the value 3,960 pounds of butter was	$1,013.76
Skimmed milk in making $185 net in pork and pigs was,	125
Skimmed milk also fed to nine high-grade heifer calves and 50 poultry in winter,	75.
A pair of twin four weeks ⅞-blood veals, net,	16.31
Milk and cream sold and used in a family of ten, say,	29.93
Total product,	$1,260.00
Per cow,	90
Do. in butter,	72.41

A year ago the writer was able to report, in a local paper, an average yield of 306 pounds of butter per cow, or 23 more than for the year just passed. The reduction is ascribed to a change in milkers, drought-stricken pastures in autumn, pumpkinless corn-fields, and a larger use of new milk in feeding calves. But the better prices obtained for butter, pork, and calves, bring the total proceeds per cow, substantially to the figures of the year before, or $90.

My cows have grass only during the early growing season, supplemented in August and September, with a morning feed of green fodder corn, and, later, with pumpkins, or soft corn in exceptional seasons, like the last, when there is an excess of this feed owing to premature frosts. To the winter rations of oat straw and chaff, corn stalks, and early cut hay largely consisting of Orchard grass, is added for each cow in milk, a peck or so of sliced Golden Tankard beets sprinkled with two to four quarts of meal, consisting of two parts of corn and three of oats by measure, fed in the stanchions.

Turning to my monthly record, it is found that 38 per cent. of the yearly total is credited to the first and last three months, and 62 per cent. to the intervening six months. It would have been better for my pocket if the proportions had been reversed; that is, if the larger yield came during the six late fall and early winter months, and the smaller percentage during the six months from April to September inclusive, when the great bulk of the butter of the country is made. The fear of milk fever or other mishap, if cows are permitted to come in during the heat of September, has hitherto prevented such wise adjustment, my experience having been that only heifers or quite young cows are proof against the deadly milk fever in hot weather. But it may be better to take even this risk, in order to lessen mid-summer and increase early autumn production.

The public taste is being steadily educated to demand fresh butter. A dealer remarked that each passing year he found it more difficult to handle held summer stock with profit to himself and satisfaction to the producers. The fact suggests the wisdom of increasing production in private farm dairies during the winter season when prices for butter, pork, veals and eggs are sure to be better than in the summer, and when the farmer has more time at his command. Comfortable stables, with a fair addition of meal and roots to the ordinary winter ration are showing fairly satisfactory results in my case, and I can commend a trial to my brother farmers. It looks as if they would be obliged to make one, or give up the business because of the changing taste referred to. Formerly June butter was regarded as the thing especially desired for family use during the succeeding winter and spring; but the increased amount of fresh creamery butter that has of late years been placed in the market, has changed all that, as the market reports increasingly show.

I will only add that, instead of having all the cows of a dairy, large or small, coming in during the spring, or in the fall months, it would be clearly advantageous to have them come in at different dates through the year, as the cream from each new cow improves the color and freshens the flavor of the entire make of the butter, besides shortening the time of churning. SPURIOUS DAIRY PRODUCTS.

PROFESSOR J. P. SHELDON.

Difficulty of finding a title expressive enough; degeneration of the "dairy"; evils due to bogus butter and cheese and their pestiferous makers; legal checks put on dishonesty in bogus butter, but dishonesty in bogus cheese still tolerated; losses entailed on dairymen by fictitious names for spurious products; the curse of lard cheese; the injury it does to the sale of the genuine article; American protection against genuine foreign competition, but none against spurious native competition; Americans "a funny people."

THE title I have employed for this article, to do duty as a sort of sponsor for it, does not exactly satisfy me, and I only use it for want of another and a better. It is a trifle misleading; it is not strictly accurate as an indication of what I mean; it inferentially casts, or might be taken to cast, a slur on the word "dairy," which occurs in it, and which is one of honor and renown; and it does not convey a sense of one half of the detestation I feel for what I mean by it, which will presently appear. I could not, however, at the moment, think of a title which "exactly filled the bill," and so I had to let it pass, *cum grano salis*. It vexes me a little, all the same, to prefix the pure word "dairy" with the impure word "spurious," and I must apologize to my agricultural readers for using a phrase which, for want of a better, occupies a position which it is not entitled to fill.

By the term "Dairy Products," we mean milk, and cheese, and butter, all of them honest and genuine, whatever their quality and condition may be, and it is a burning shame that anything which is not honest and genuine should ever have come to be classed with them, under any conditions whatever. Until recent years, the dairy was a place which bore a reputation that was not sullied by the nefarious practices of those who have used it for a cover for dishonesty. It was suggestive of cleanliness and purity all through. Its very name conveyed an odor of sweet milk, and a glimpse of golden butter. George Eliot immortalized it in Adam Bede, and Charles Dickens declared that if mankind were to return to the worship of animals, the cow would be the chief Divinity. It was the scene of wholesome labor, and the source of honest profit, almost universally, in the days that are gone. The farmer's wife shone in it with credit, and the good man reaped a substantial reward. It was the center toward which all the outside labor of the farm was directed, and a cruel thing it is that spurious articles should have injured its reputation, and diminished the profit which it was wont to yield.

I charge all this disaster to bogus cheese and butter, and to those who make them. These people, under the specious pretext of utilizing animal fats, have done to an honorable industry an injury whose extent is simply incalculable. They have grown rich in despoiling others. Their aim is to steal a march on dairy farmers, and to cheat the public. In both, they have succeeded monstrously, and the process is still in full swing. The butterine man uses milk and butter, in part, and the bogus cheesemen use the caseine of milk as a plausible base for their spurious productions, and hence it is that they have attained so much success. Money is clean, anyhow, however dirty the source from which it may have been obtained, and profit is pleasant, no matter whence it comes; so these people think, of course. And the game goes merrily on, while dairy farmers are defrauded of a large part of their just profit, and I suppose this will go on until the nations rise up in indignation and put an end to such unscrupulous practices once for all.

Something has been done in your country and ours, and in others too, to place some restriction on the unblushing sale of margarine as butter, and the profits of dealers and workers alike have been properly curtailed; but nothing has been done to bring bogus cheese to book. The retail dealers in margarine, in this country, complain that a once lucrative trade has shrunk alike in profit and in volume. The public still buy margarine extensively, but they do so with their eyes open, and at a price which more nearly approaches the intrinsic point. Buy it they will, and buy it they ought, let us frankly admit, for it is a useful thing when made of honest and cleanly materials. What we complain of is the abominable fact that it was ever called by a name which identified it with the dairy. This it is that has done most of the harm to dairy farmers, for had the spurious stuff from the first been called by a name which properly and effectually disconnected it from the dairy, not a tithe of the mischief would have been perpetrated. As it is, an ancient, honorable, and legitimate industry has been deliberately and insolently plundered by one which is probably ephemeral and certainly dishonest.

But what about "lard cheese," and the mischief it is doing to the legitimate dairy? This stuff, too, is made in factories, in part from milk, and is unblushingly called "cheese," without any affix or prefix. Again, the pretext is that animal fats, which might otherwise be neglected, are put to the best use possible by being incorporated with skim-milk cheese. Here it is that the deception comes in, and the public are swindled, while a deadly injury is inflicted on dairy farmers. Skim-milk, which ought, for the most part, to be fed to calves and pigs, is made up into a product which, by the admixture of lard and other fats, is made to simulate the cheese of the dairy farmer, and is sold as a genuine article. And what is the result? Well, people buy it, taste it, think it rather funny, and give up cheese eating altogether. They find it to be anything rather than an aid to digestion, as Shakespeare considered cheese to be. Lard cheese had not been invented in Shakespeare's time, and we can only deplore the fact of its subsequent evolution. I know a man who once ate some of this stuff, toasted, at supper; he was hungry at the time, or he wouldn't have eaten much of it; he survived, but the Doctor declared he had had a close shave of it, and he has never tasted American cheese since. And so it is; lard cheese is an American production, and the British public are rapidly coming to distrust and suspect American cheese, generally, on account of it. In plain, sober truth, bogus cheese is very seriously discounting the reputation of genuine American cheese in the English market, and so it is that American dairy farmers are being plundered.

I wonder how long your people will submit to this sort of thing. In free-trade England, we admit almost anything, and let it stand or fall on its merits. But America is, *par-excellence*, the country of commercial and industrial protection You protect your people against a genuine foreign competition,—a competition which would be fair and square—why, therefore, in the name of thunder, don't you protect your people against a spurious and impudent native competition? You protect the skin, so to speak, of your great and noble country, and you tolerate a festering abscess in your vitals. Indeed, you Americans are a very funny people. You could crush a vast civil war, and you seem to be powerless against bogus cheese. Oh, fie! surely you don't perceive the evil of it, or you wouldn't permit it.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

DONNELLSON, Montgomery Co., Jan. 2.—Times are very close in this locality, although we had above an average crop year. The previous year's failures were the cause of our distress, for to make the loss good it cost the farmers all their ready cash, and many incurred debt for feed to get through the winter and make a crop. At present, feed is plentiful, and stock are in good order. Hogs are numerous and "going like hot cakes" at $4 to $4.70. Cattle are plentiful, but sales are dull at $2 for choice animals. For horses, there are no offers as yet. Clover and pastures are lovely. In short, old '88 has had more joys than sorrows, and its memory is to be loved and cherished. Wheat looks well, though but a small acreage was sown. A. W. R.

Iowa.

DES MOINES, POLK Co., Jan. 1.—The past year was neither good nor bad for farmers It found a great many of our farmers in debt after the two previous years of drought, some paying heavy interest, and all hoping for better times. It has given us great crops of almost everything, and while we feel very thankful that we have been able to produce so much, and that there is plenty in the land to feed all the people and all stock, yet prices are so low and our market for farm products so poor that we will not, as a farming class, be able to meet all our debts, and a great many farmers will have to commence another crop encumbered with debts. Still, but few of our people seem to be cramped; most of them seem to be looking on the bright side. We have had a very merry Christmas, and the trade in presents for the joyous festival was unusually large. Our fall and winter so far have been ones long to be remembered, as among the finest ever known in Iowa. Our fall was very dry; in fact, too dry for plowing, so that very little fall plowing was done; but the corn crop was all gathered in before the holidays. The thermometer has not been as low as zero yet. On Christmas night we had a snow storm, and the snow was drifted four feet deep in places, yet the weather has not been cold. Water is scarce in most places, and it is hard to get enough for stock. The snow has been melting somewhat and we have had several light rains, which have helped. The ground is barely frozen under the snow. One of my neighbors dug potatoes the day before Christmas, and found that but few of them had frozen. Vegetables to an unusual amount were stored for this winter, and the weather has been so warm that they are not keeping well. This is the prettiest New Year's Day I have ever seen here. I feel that I have been greatly benefited by the visits of the RURAL during the past year, and hope all its readers have been so too. F. S. W.

Virginia.

RICHMOND, Henrico Co., Va., Jan. 5.—Tobacco planters have been so discouraged by prevailing low prices of dark leaf that they are holding it back. Common old stock is selling at three to four cents per pound. The weather for the last three weeks has been mild and open and quite comfortable without fires. The business outlook is fair to good in tobacco, but there will be many losses for 1888, to be gradually met and felt in 1889. Indeed very little money was made in tobacco last year and what was made was only in exceptional cases with special brands of the weed. During the past week new West Virginia bright crops have been sampled, and sold by auction, bringing very satisfactory prices. One crop from Putnam county brought an average of 44 cents per pound! L. T. M.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

PREPARING LAND FOR AN ORCHARD.

J. B. Mc C., Mt. Morris, Pa.—I want to plant an acre of peach, apple and plum trees on a poor white-oak and chestnut, yellow sandy hill, the soil of which is underlaid with clay. It appears well adapted to fruit. Stable manure is difficult to get, but Forest City superphosphate has given me a good catch of grass, and helped my crops generally. I wish to prepare the soil so as to produce good crops while it is growing richer. What kind of fertilizer should I use, and how much per acre, and what crops would be likely to give the best returns and benefit the fruit most?

ANS.—The best fertilizer for fruit trees is unquestionably a mixture of coarsely ground raw bone and unleached hard-wood ashes. For a first dressing, 1,000 pounds of the bone, and 50 bushels of the ashes (both well worked into the soil) would be none too much, especially as the land is "poor." It is not said whether the land is poor by nature, or by bad farming; but we infer the latter, as it it said to be "well adapted to fruit," which naturally poor land is far from being. If the land is to be cropped while the trees are young, the crops should be manured the same as though the trees were not there, and they should always be hoed crops. Small grains are death to a young orchard. Low crops—beans, roots, etc.,—are the best. While the trees are small, strawberries, well manured, will do well among them. Currants, gooseberries, or black raspberries will succeed in and between the rows until the trees get well into bearing. Profit from tree fruits is quite as much dependent upon care and good culture as in the case of any other crop whatever. When it is proposed to crop between the rows for a number of years, it is best to make the rows considerably wider apart than the trees in the rows. Then the cultivation can be continued for a considerably longer time.

WHAT AILED THE STEER?

M C. M., Blackstone, Mass.—When I went out to milk one night recently, I found one of my three-year-old steers lying down and sick. I couldn't make him get up. The doctor came in about two hours and gave him some physic, and said the trouble was impaction of the rumen. He cut into the rumen and removed its contents; after which he inserted about two pounds of salts into it, and then sewed the opening up. The contents of the rumen seemed to be packed pretty hard, but were not dry. The steer died in about 30 hours, nothing more being done except to give him some oat-meal gruel. Was it impaction of the rumen, and was the treatment proper?

ANSWERED BY DR. F. L. KILBORNE.

You should have given a full history and the symptoms of the case, if you expect us to give a satisfactory opinion as to the disease and treatment. In the absence of any facts to the contrary, we suppose the steer was taken suddenly sick, with no apparent or known cause for the attack; that there had been no change in diet, and that the only marked symptoms were the lying down and refusal to rise when urged to do so.

If these are the facts, the history and symptoms are not what we would expect in a case of impaction or over-loading of the rumen. We suspect the doctor failed to correctly diagnose the disease, and consequently gave the wrong course of treatment.

YELLOW OR JAUNDICED PORK.

J. J. H., Pardoe, Pa.—The other day I butchered six hogs, each about one year old, which had all been fed together. They ran during summer in an apple orchard. Their food was principally milk during summer, finishing off with corn since the winter apples began to fail. When I dressed them, I found two of the largest and most healthy-looking somewhat peculiar. The entire carcasses were of a yellow or saffron color, the lard after being rendered, still retained the same color. The color of one pig was black; that of the other white. What was the cause, and is such pork fit for food?

ANSWERED BY DR. F. L. KILBORNE.

The color of the flesh was probably due to a re-absorption of bile into the system, followed by the staining of the tissues with the bile pigment. The causes that may produce this re-absorption are so numerous and often so complicated, that it would be impossible to say, without making a personal examination, what caused the trouble in the present cases. While I cannot advise any one to offer such meat in the market, because, strictly speaking, it is not clean, healthy meat, I am of the opinion that it is suitable for food, and, except a prejudice against the unnatural color, I believe there is no special reason why it should not be so used. It is certainly more wholesome than large quantities of meat that finds its way into the market.

SWELLING ON A COW'S KNEE.

M. C. G., Johnson's, N. Y.—On the knee of my three-year-old cow in milk, there is a lump as big as a fist, produced, I suppose, by a bruise. It is spongy and soft. She is now in a box stall. I thought of putting a seton in the swelling; would it be safe to do so? What is the proper treatment?

ANS.—Try painting the swelling every three days with compound tincture of iodine until the skin is considerably blistered; then apply it less frequently. The seton should not be inserted, because it is liable to increase, instead of removing, the trouble. And, in any case, an extensive swelling about a joint should not be opened except by a competent veterinary surgeon, as the joint, or a synovial sac might be opened, and that would be very difficult to close and heal. If the above treatment fails, call a veterinarian to examine the cow.

GRAFTING APPLE TREES.

J. C. M., (no address).—What is the proper time for grafting apples? Where can I get a work on the subject?

ANS.—1. We prefer to graft apple trees just before the buds break. They may be grafted earlier and later. The writer has succeeded in grafting apples even after the buds have pushed. But the cions must be dormant. We have thoroughly explained the process many times, and will probably go over it again before spring. Any of the pomological works explain grafting and budding, such as Thomas's American Fruit Grower, and Barry's Fruit Garden.

Miscellaneous

C. N. R., Canton, Pa.—What is the address of some manufacturer of No. 1 grain drills.

ANS.—A. B. Farquhar, York, Pa.; P. P. Mast & Co., Springfield, O.; Spangler M'f'g. Co., York, Pa.

G. S., Westfield, N. Y.—Our canning factory wants me to raise a small, red, smooth tomato to put up as a fancy article. What kind would you suggest?

ANS.—King Humbert, Wonder of Italy, Nesbit's Victoria, or the Pear-shaped. They are all nearly alike.

L. H. T., Elmira, N. Y.—The authorities at Washington will furnish you with a circular entitled Instructions Relative to Entries Under Homestead, Pre-emption, and Timber Culture Laws, that will give you full information regarding "homesteading." Address General Land Office, Department of The Interior, Washington, D. C.

L. D. A., Texas Valley, N. Y.—1. I sent the RURAL some gooseberry plants two years ago; what about them? 2. How can I exterminate snails?

ANS.—1. The plants did not live. 2. We do not know, but should try Buhach, salt and water, and the kerosene emulsion. Some of our readers may be able to answer the question definitely.

J. C., Petaluma, Cal.—1. Under the head of catalogues, etc., is noticed an Introduction to Entomology, by Prof. Comstock: is this free, and are such things in general free, when the price is not mentioned? 2. Is it better to burn leaves, corn-stalks, potato vines, and all such rubbish as collects on the farm, or to put them in the compost heap? 3. Did the RURAL print an article on the best disposition to be made of straw? If so, in which number?

ANS.—1. The price of Prof. Comstock's book is $2. This price should have been given when the volume was noticed. The idea is that all pamphlets for which no prices are stated are supposed to be free, though it is always courtesy to inclose stamps when writing for them. 2. That depends upon many conditions, like the cost of labor, the location of the rubbish, etc., etc. On our new farm which is sadly in need of manure, we have collected large quantities of leaves, vines and stalks, which, after being used as bedding, have been thrown into the manure heap and mixed with wood ashes. Other vines, brush, chips and rubbish were collected in heaps on the ground designed for potatoes. In the spring, these heaps will be burned and the ashes will be scattered. 3. You will find the article you speak of on page 623 of the RURAL for September 24, 1887.

DISCUSSION.

MORE HEN TALK.

O. H., GREELY, COLORADO.—On page 709 of last year's RURAL, "Jerseyman" had a savage article about "city farmers." Among other things he laughed at the idea of making a fortune out of hens. I have said many times that I believed I could support a very large family from fowls alone. This was several years ago before the recent low prices for chickens and eggs. At this writing, eggs sell readily here at 30 cents per dozen, and in September spring-chickens were selling slowly at 25 cents and 30 cents each. The Kansas and Nebraska people send fowls into Denver so that they sell at very low rates—so low, in fact, that we could not raise them at much of a profit with corn at 66 cents and wheat at $1. per bushel. Of late years, I have seen barrels of Nebraska dressed fowls selling at from six to nine cents per pound. We sometimes see flat cars on the Union Pacific piled high with coops of fowls—probably thousands of them—going through from Nebraska to the Pacific coast. Last spring, eggs dropped once to 10 cents per dozen and sold for weeks at 15 cents, so I am not so sure of the profits of the hen business as I was when prices were far better. I often wonder how it was that I sold, when a boy, three and four-pound spring chickens at the Fourth of July, for the Boston market, for from $2 50 to $3 50 *per pair*, and cannot begin to do it in Denver.

I know one thing—we boys used to make a good deal of money from our fowls, and we knew how to manage them. I am very positive, and we had no glass houses and had never heard of anything like an incubator except the following, which we read in Lippincott's Gazetteer, in an article on Egypt: "Of all the trades pursued in this country, the most remarkable is the hatching of eggs by the artificial heat of ovens—a peculiarity of Egypt handed down from ancient times. The poultry reared in this way are wholly without the instincts which relate to the care of offspring; the artificial method of hatching, therefore, when once resorted to, soon becomes necessary, and the natural system of incubation is totally superseded."

Now, if I were to make a poultry test, very much as the RURAL made a potato one, with the intention of seeing how much money I could make from the smallest capital, I would act as follows here in this dry climate of Colorado. I take the hint from the poor Mexican women of New Mexico, who, travelers assure me, raise quantities of eggs and fowls on a small investment.

If the problem was to see how one could make the most clear money from fowls, in one or two years, considering the investment of money and labor, I would contrive pits in the earth at regular intervals, on a four-acre lot. Each pit should be about three feet deep, and sheltered by a sloping roof of some inexpensive material, like a battened door, or poles, willows, grass, hay, straw or earth. The effort should be to construct a shelter, offering the following advantages in some of its various parts: warmth, dryness, coolness, light, darkness, secludedness, and safety from nocturnal visitants.

The hen entrance should be such that it could be instantly closed by the hen-farmer, to keep out unwelcome visitors; or to keep the fowls in at stated times. The perches should be so placed as best to insure the safety of the colony. The hens will lay in dry-earth nests very well. About 24 hens to the colony would be enough. One man would have to work hard to care for 1,000 or 2,000 fowls. That man should be the owner. If I wanted eggs mostly, I would have the White Leghorn, an easy keeper and a good layer. As for an egg-producing article of diet, I believe the world never yet saw the beat of sweet beef-bones chopped into pieces about the size of peas. A ration of this, with a variety of grains, crumbs, sour milk and water, and eggs will be plentiful. Bone crackers are offered for sale in many places. In this climate, hens very sensibly enjoy the coolness of a cellar in summer, where they will sing and coin money for a fellow, as Uncle Marcus used to say, "like all possessed." I have tried it.

CONSUMPTION OF HORSE FLESH.

W. L. H., BROOKLYN, N. Y.—The consumption of horse-flesh by people on the Continent of Europe, and especially in France, has long been legalized under certain restrictions. What is disposed of in this way is sold for what it really is, or, at any rate, severe penalties are provided for its sale as anything else. In England, however, it appears that a good deal of it is sold as beef. I wonder whether American butchers are innocent of such practices. At a recent meeting of the butchers of Manchester and Salford, (which are practically a single city) it was stated that 100 shops in both places were regularly engaged in the sale of horse-flesh, and that the "joints" were delivered in carts after dark. The slaughter-houses were watched, and some of them also protected by dogs in order to prevent casual inspection. Good horses could not be sold for eating purposes under from 25 to 60 cents per pound, whereas the average prices of horses for slaughtering ranged from $15 to $25. Municipal and government authorities were asked to regulate the traffic. Experience among wild and civilized people amply proves that horse-flesh is a savory and wholesome article of diet. Its quality, of course, depends, to a great extent, on the age and condition of the animal, and as nobody anywhere raises horses for meat production, those only which, for some cause, are unfit for work are, as a rule, sold to meat consumers. It is, therefore, all the more necessary that, while traffic in horse-flesh should not be prohibited, it should be strictly regulated by law, both for sanitary purposes, and to prevent imposition on the public. There is no doubt that prejudice alone forbids the use of this kind of food. Would it not be well to take advantage of circumstances to render it useful if not popular? For instance, the great obstacle to the maintenance and efficiency of large armies in the field is the difficulty of providing a sufficiency of wholesome food just where it is wanted. Now, the horses of an army are, as a rule, quite healthy, though sometimes they are rather thin. Their flesh would therefore be always wholesome, though sometimes not very juicy—but then it would, at the worst, be as palatable as the hard tack or fat pork which the soldiers often find so very appetizing. The fatality among horses in an army in the field is very heavy, even apart from the deaths in battle. Why not utilize as human food the large supply of meat thus furnished? Of course in cases of distress, it is often utilized: but food thus forced on men is seldom used by any of them after the necessity for it is over. The meat is wholesome; a well disciplined army is bound to accept the rations served out to it; why shouldn't wholesome, handy horse-flesh form part of such rations? The men would thus become accustomed to the article, and would be likely to use it after they had been discharged, and others would soon follow their examples, especially as its wholesomeness would be assured by the government. For Americans there is one strong recommendation for this plan—it would have to be tried first on the monstrous armies of Europe; for while destructive war is not unlikely to begin any day on the other side of the Atlantic, on this side productive peace is certain to be of indefinite continuance.

A DISPUTED POINT IN CORN CULTURE.

S. W. H., METUCHIN, N. J.—That cornfield? What is the matter with it? The corn failed to ripen off, and the reason for this was, I think, because I did not go through it with a small plow and sever some of the roots. This ought to be done when it first comes into silk; but heavy showers with high wind in July twisted the corn so that I could not follow the row. With this exception, I have not failed to do this for the last ten years. I use a No. 18 one-horse plow with the handles narrowed up, so as to enable me to run close to the row, but not close enough to lift the hills. I find that corn ripens a week or ten days earlier if this operation has been performed. Still I would advocate comparatively level culture in the early part of the season. Four years ago, I had a part of this same field in corn. In the latter part of June when the crop was about three feet high, we had so much rain that, owing to the softness of the ground, I could not work the field until the first of September. Even then, the horse got mired; but I got around the field in lands once while the corn was in the milk. Ten days later I went over it twice in the rows, leaving two and four rows at intervals for experiment's sake. Near the last of August a neighbor passed the field. "Well, I declare," said he, "what corn stalks, but not an ear. You have a poor show there. Why," said he, "my corn has roasting ears on it." I could not get him to come and see the corn before I cut it up, which was the last of October. It turned out 110 bushels of ears per acre, and had I gone over every row, the yield would have been greater. I have often seen a field of corn of very rank growth, with stalks almost ready to burst so full of sap were they, and leaves reaching away across their neighbors, as if crying out, "Give us more room," and I wondered if it would ever be satisfied. Were the season long enough and it found material to feed upon, I believe

that a narrow, deep furrow on each side of the row, checks the growth, and throws the force into the grain.

E. L. B., GROTON CITY, N. Y.—I have always been told that if the milk from a farrow cow was put in with that from new milch cows, we would get no butter from the farrow cow's milk, because the butter would be so much longer in coming that it would be left in the buttermilk. I never had any means of testing this, but here is my experience with our last churning. We have eight cows that we have been milking since last spring. In the last churning, there was a little milk from a new milch cow—just what the calf did not take. The condition of the cream, etc., was as nearly as possible the same as usual. Through November and December, it has taken from one-half to three-quarters of an hour for the butter to come; but it took only 12 minutes for it to come in this churning. The amount of butter, as nearly as I could judge, was about the same as before from the same amount of milk. I certainly never knew the butter to come so soon at this time of the year. I thought I would profit by what I heard at the institute at Cortland, so I weighed the milk for one churning. Here are the results: Pounds of milk for five days, after taking some out for use in the family: 27, 22, 24, 22, 28, 22, 26, 19, 24, 22.—Total 236. Pounds of butter, 13. 236 divided by 13 equals 18 2-13.

G. B. T., SOUTH ORANGE, N. J.—In the RURAL of January 5, under "What Others Say" is an account of the "Average yield of corn per acre." Four States are named as giving a larger yield than New Jersey. After a careful estimate by measuring the ears of corn taken from a given number of shocks, and counting the shocks in the field, I have determined that 3,000 bushels of ears of corn grew on less than 20 acres of land on the "Red Gate Farm," in Sussex Co., New Jersey, this last season. Let us hear what farm or field has done better than this.

I. J. B., TITUSVILLE, N. J.—We have a few trees of cider and other varieties of apples worked on the Doucain stock, that were set in the orchard in the spring of 1864. They are now from six to 11 inches in diameter at the ground, and perhaps 25 feet high. They are as large as the free stocks, and look as if they would live a long time. They were worked low and have borne good crops of fruit. I believe the Doucain will grow with most kinds if worked low.

W. S. C., CUYAHOGA FALLS, O.—At the top of column two, page two, of the RURAL for January 5, Mr. W. J. Green is reported as saying that the Monmouth strawberry, among others, should be sent C. O. D. whence it came. A mistake has been made somewhere. He condemned the Mammoth, not the Monmouth.

What Others Say.

A BUSINESS RETROSPECT.—The press of the country takes a cheery view of things in general. The Herald says the year of our Lord 1888 went into history gaily and trippingly. It leaves behind it a degree of general prosperity in this country which stimulates the gratitude of all classes and excites the wonder, if not the envy, of other nations. It has been more than kind, and, perhaps we may add that it has been more than generous to us. To a far greater degree than any other people on the globe we Americans are engaged in material development. We have not inherited a land which has been the battle field of a thousand years, a land of crumbling castles and drained resources, but a virgin soil which invites enterprise, awakens avarice, inspires the genius of invention.

We may congratulate ourselves that the business of the country is forging ahead with the firm tread of assured success. Thriving trade, promising opportunities for investment, not only indicate the increasing wealth of the few, but—what is of more consequence—a larger degree of contentment and a wider measure of happiness for the many.

THE PROFITS ON BEEF.—It appears that the lowest cost of getting cattle ready for market, according to the Chicago Tribune, is two and a half cents per pound, so that when the cattle raiser is paid anything over that figure he is in a position to make money. With the average bullock weighing 1,000 pounds, the cost of placing him on the market would be $25. He is bought in for, say, three cents, or $30, which gives the raiser 20 per cent on his investment. The $30 worth of bullock is then sent to the slaughter-house, and when seen again is in the shape of 500 pounds of marketable meat, the hide, tallow, etc., bringing say $7. These 500 pounds of meat are sold for six cents, or $30, which, with the $7 for hide, etc., foot up $37. This is a profit of 23 per cent. The retailer takes the 500 pounds of dressed meat for $30, and immediately cuts it into ribs and loins, of which he gets 125 pounds, and has 375 pounds of plates, chucks, etc., left. He gets 18 cents per pound for his choice cuts, or $22.50, and an average of seven cents for the coarse meat, or $26 25, or a total of $48.75. It cost him $30, so it will be seen that his little percentage figures up something over 60, yet he will tell you that he isn't making anything, and would persuade you that he is doing missionary work for the benefit of his health and the convenience of the public.

THE TOMATO EGG-PLANT.—We find the following in our excellent contemporary the American Agriculturist: "Our engraving represents a curious new plant which attracted a large share of attention at the last Burlington county, N. J., fair, where it was exhibited by B. F. Bishop, in the collection of the "Progressive Farmers' Club." The plant has the general appearance of a common egg-plant, while its fruit, when ripe, resembles a medium-sized, ribbed tomato. Its skin is very glossy and bright red, much like that of a Cayenne pepper. The history of the plant, so far as we could learn, is that the year before last a single specimen of it came up among a large number of Black Pekin egg-plants, growing in Southern New Jersey. The specimen from which our illustration (representing the fruits and leaves one-third natural size) was drawn, was raised from seeds of this original plant. The flesh of the fruit is very solid and dry, apparently unfit for use, but as a curiosity and ornament the plant is worthy of a trial by those in search of unusual novelties. The cultivation of the plant is the same as that of the common egg-plant."

The R. N.-Y. would say to its neighbor that the Tomato Egg-plant has been offered by seedsmen for 25 years, and longer for aught we know, and its name is the "Scarlet Chinese Egg-plant."

ROAD LEGISLATION.—The best test of the civilization of a country is found in the condition of its roads, and good roads are indispensable to the material prosperity of a country. The RURAL'S late Road Special has directed unusual attention to the advantages of good country roads, and the subject of improving our road legislation and our systems of highway administration is referred to in the annua messages of Governor Ames, of Massachusetts, and of Governor Beaver, of Pennsylvania, transmitted to the Legislatures of those States last week. Governor Ames recommends the passage of a law authorizing the appointment of an officer having a general oversight of the roads and bridges of the commonwealth, and authority to report annually regarding the condition of the roads and bridges, with suggestions for the improvement of the same. Governor Beaver suggests that the road laws of his State be thoroughly revised and codified. Now, it is to be hoped that good results may come from agitation of this subject, not in these two States alone, but all over the country.

MANITOBA'S WHEAT CROP, 1888.—The Manitoba wheat crop before frosts was estimated as high as 12,000,000 bushels. But the frost did considerable damage, affecting, it has been estimated, one-quarter to one-third of the crop. The damaged grain, however, is not wholly spoiled. The farmers have, according to Bradstreet's, paid their notes given for farm implements to the extent of 90 per cent. of the whole. The Dominion, taking all the colonies together, will have scarcely any wheat for export, and may have to import from the United States to a limited extent.

ARTESIAN WELLS IN THE ARID REGION.—New Mexico and Montana are asking Congress for appropriations for the purpose of sinking artesian wells in the hope that they could be used in irrigating arid land. It is hoped that the appropriation asked for will be made. A sufficient appropriation of this character should be made to sink experimental wells in every important part of the arid region. It is especially desirable that they should be sunk in southern Nevada. There is a vast area of country in the southern part of that State which, according to the Denver Republican, would be very valuable if it were reclaimed from its arid condition. It is possible that this result could be attaind by sinking artesian wells.

THE FARMER OF THE FUTURE.—Blackwood's Magazine is one of the oldest and best of that class of periodicals, not only in England, but in any part of the world. In a very fine, thoughtful article on English agriculture in a late issue, it speaks as follows on the above topic; and what is here said of the English "farmer of the future" is equally applicable to the American:—The successful farmer of the future must be well grounded in the general and technical knowledge of his business. He must look closely and more carefully into the internal workings of his farm than was necessary in former times. He must watch keenly every movement of the foreign producer, study the condition and prospects of the markets, and be prepared to produce such commodities as are likely to bring him the best returns. He must not tie himself to the growing of certain crops and the rearing of certain stock merely because his forefathers did so, or because he himself found them profitable in times gone by. He must cultivate an 'open mind,' be ready and willing to avail himself of any new system or modification of practice calculated to benefit him, being careful, of course, not to attempt upon a large scale practices that are risky or have not been proved by actual test. He must not be above giving his attention to little points of detail, or to tiny driblets of income, for in agriculture the 'day of small things' has assuredly come. Method, precision, industry, forethought, economy, sound and ready judgment, and intelligence—these are the elements of successful business. They are as essential to the farmer of to-day as to the busiest business man in our greatest commercial center. Conducted by a race of farmers thus qualified, there need be no fear as to the future of British farming.

VINTAGE PROSPECTS IN EUROPE.—From an article on this subject in Bradstreet's, we learn that although in some quarters the vintage in Europe has been medium, in too many districts the crop must be regarded as a failure. While, with the striking exception of the Médoc, quantity as a whole is under the average, in no locality is quality likely to be as good as it was last season. In the Bordeaux district while the quantity is larger than it has been for several years, the quality is inferior.

In Champagne the crop has been a complete failure. Few of the grapes gathered can be used for making champagne, and these can only produce a wine of the poorest description. Nevertheless, the prices demanded by growers are higher than those of last year. In the Saumur district also the results of the vintage are insignificant both in quantity and quality. Burgundy has been more fortunate. Where the vineyards are free from phylloxera the yield is above the average. In Cognac the yield is larger than has been known for several years, but neither in strength nor quality will the brandy equal that of last year. On the Rhine and Moselle the wine, in quantity about two-thirds of a full yield, cannot reach a medium excellence. From Italy the news is equally discouraging; though the quality in some districts is of fair average, the quantity of wine made shows a material diminution from that of last year. In Austria and Hungary the yield amounts to about one-half of an average, the quality being better than was anticipated. From Greece, Turkey and Roumania, the reports are much more cheerful. Although the quantity leaves something to be desired, yet in the more important matter of quality there has been a distinct success.

BRIEFS.

A REPORT by Major J. W. Powell, director of the geological survey, was sent to Congress on Jan. 2. He calls attention to the fact that about two-fifths of the entire area of the United States, exclusive of Alaska, is dependent on irrigation for its fertility, and it is mainly on these lands that the future settlers on the public domain must make their homes. He asks that $350,000 be appropriated to carry forward the survey during the next fiscal year. He estimates that a region large enough to make four or five States like Pennsylvania, now almost entirely infertile, will bear great harvests, if the project of irrigation shall be wisely and energetically carried on.....

"GOD makes short rib sides, and man makes lard," is the way a Chicago man once illustrated the facility for increasing the one product beyond the producing power of the hog.....

YOU remember, don't you, says the Christian Union, that remarkable echo you used to court when a child? At the other end of the pasture lot was a knoll, then a low marsh and, on the other side of that, an old barn. Standing at a certain point on the knoll, every sound you made was tossed back at you with surprising abruptness and clearness. It seemed as if the neighboring woods were peopled with elves, big and little, good-natured and belligerent, hilarious and grief-stricken. And how sympathetic in their expressions the spirits were! Shout, they shouted; laugh, they laughed; whistle, they did the same; sing, and they filled the valley with music. Every newspaper has its echoes, or ought to have; and the louder, clearer, and more varied its voice, the more vigorous and invigorating its chorused echoes reverberated by its correspondents. Without these, the editor may shout as loud as he pleases, but his voice is wasted on the fog. It is evident that he has no audience; and a one-sided conversation soon becomes dull and profitless.....

THAT popular farm writer, Jacob Biggle, says that the best bacon is made from pigs that weigh about 100 pounds when dressed, and have a good coat of lean meat along the back Only the sides are used, and these should be cut lengthwise in strips about six inches wide, or nine, so as to get even cuts from the side. For 100 pounds of meat, use six pounds of salt, four ounces of saltpeter, and five pounds of brown sugar, well mixed and rubbed into the meat, which should be piled flesh side up. Every three days it should be rubbed till the mixture is all absorbed by the meat; then it is ready to be smoked. If it is to be kept through the summer, one pound more salt may be added. Smoke with hard maple, birch, or hickory chips, or corn-cobs till the meat is a delicate brown, or dark straw color. Instead of rubbing, if preferred, it might be packed in a pickle of the same preparation as above, and kept under by weights for six weeks..... ..

A LAZY head man will cost more than any farmer can afford to pay, for he will spoil all the other men on the place. Under his management, the work will never get done, and the more men there are around the more you will be in the lurch. Especially if you are not always about the work yourself, it is absolutely essential to have an honest, interested, pushing man as leader of the farm force. To have any other sort invites disappointment and failure.....

OLEOMARGARINE, lard, and other nefarious adulterations have spoiled our trade in cheese says Henry Stewart. It has been notorious for some years past that good cheese was exceedingly difficult to procure in the United States, and that it has constantly lost ground in the English market because of its inferior quality. And, while we have been falling into a demoralized condition, the Canadians have beaten us by manufacturing the best possible quality and by refraining from the use of adulterants.....

INSECT Life published, by the U. S. Department of Agriculture, with Prof. C. V. Riley as the Editor-in-chief, says that the Buhach Producing and Manufacturing Company, of Stockton, Cal., very generously offered to sell the Department some time ago seed of Pyrethrum cineraræfolium, at the following rates: One pound, $50; 5 pounds, $200; 10 pounds, $350; 50 pounds, $1,250; which shows that there is money in the cultivation of this insecticide plant in the United States. We have already shown that the plant can be successfully grown over a large portion of the country, and it seems remarkable that this firm should have enjoyed a monopoly so long.

The R. N.-Y. was among the first to test the hardiness of this plant after it was made known that the powder of its flowers raised in California was just as effective in destroying insects as the imported so-called Dalmatian Insect Powder. Plants started from seeds at that time [some six years ago] are still alive and thrifty.....

LAST Sunday, one of the New York City papers got up a "symposium" as to how a moderate sum of money could best be invested profitably and safely, and real estate mortgages held the first place in the answers, and real estate itself the second.....

THE N. Y. TIMES takes the view that our present system of destroying diseased cattle, is closely akin to putting out fires by the fire companies. It is only a temporary relief, and does not prevent future outbreaks, because the causes are not removed. The slaughtering method of dealing with this disease has been in operation in England for many years, and yet the disease breaks out here and there in widely-distant places every month. One recent out-break cost $250,000 to stamp out by the present ineffective method .....

A CORRESPONDENT of the O. C. Farmer was led to set out an asparagus bed in his home garden five years ago, and it was the best job he ever did in his life. His family is large and he has, for the past two years, had enough to supply his table abundantly. It is worth $25 every year to him, and all the plants, labor and fertilizer expended on it have not yet cost $10.....

YES, an asparagus bed is a good bed to have and to hold. We hope that every

reader of the R. N.-Y. that does not raise asparagus will conclude to do so next spring. A bed 33 feet square will in three years give asparagus enough for a family of four.....

MESSRS. TERRY, Gould and Cook think highly of the new Cutaway harrow..... ...

THE AMERICAN GARDEN for January, thinks, with the R. N.-Y., that Dr. F. M. Hexamer would make an efficient and trusty Commissioner of Agriculture. It also mentions, as we have done, that either P. J. Berckmans, or E. M. Shelton would be first-rate men for the position. It further mentions Eugene W. Hilgard, of California, and Thomas Meehan, in the same category. They, too, are unquestionably able, true, men. It seems to the R. N.-Y. that if the Commissioner is to be chosen from the West, it would show an appreciation of his valuable services while Commissioner under Hayes, if Gen. W. G. LeDuc were again appointed.....

E. S. GOFF, in the Garden, speaks of having beautiful sweet pea blossoms in early November. The seeds were put into the ground last April, the very day the soil became dry enough to work, and many days before it was warm enough for them to grow. But is it usual for sweet peas planted so early to continue blooming throughout the season? Judging from past experience, it is not usual. Mr. Goff attributes the marked success in this case to deep planting, thorough watering during the dry summer weather, and keeping the flowers picked so that no seed was permitted to form. In seasons when these precautions have not been observed, the plants have dried up in August, and their highest beauty has lasted but a few days after their period of full bloom. He regards the systematic picking of the flowers as even more important than the watering in dry weather, but both are essential. Not a pod must be permitted to form.....

A NEW and distinct variety of potato will be offered under the name of Bliss's Rough Diamond. They are of Peachblow shape. The skin is tough and "corrugated." It is thought to have great keeping qualities.....

MR. TERRY says, in the Ohio Farmer, that if he were in the dairy business now, he would stick to it instead of changing to potatoes. The planter and digger make it so easy to grow potatoes on a large scale that thousands will rush into it. Those who invested in these tools at the very first made some money, and can stand the low prices which are almost as sure to come as they did in the wheat market soon after the binder came into general use...

WINTER is the time to do good mental work, says Mr. Crawford, in the above mentioned journal. That is true; the nights are long and we get all the rest we need. We are not exhausted with bodily exercise which "profiteth little." The surroundings are favorable for one important work we have on hand—getting ready for spring. Is it not a fact that spring usually comes before we are ready?.....

LET each one ask himself these questions: What can I raise that will yield the greatest profit? How can I best inform myself concerning what I expect to grow? What fertilizers, seeds, plants and tools do I need? What each one can raise most profitably must be determined by himself. He must study his market, his land and himself.....

EVERY man, continues Mr. Crawford, has certain advantages, but some never learn what they are, for want of thought. One can not know too much about the crops he cultivates. The great majority of us know too little. Fortunately there are abundant means of becoming posted for all who are anxious to learn. If one has a specialty, he should read all that has been written on it.....

PERHAPS the farmer can get along without buying fertilizers, but the horticulturist can not. As all his efforts are directed towards changing plant food into a more valuable product, surely he can not afford to be too saving of the raw material. If his capital be too small to buy all he would, let him cultivate a smaller area and make that rich. One should study the catalogues with a view of learning all about the different varieties, and send his order for supplies in good season. He can not afford to be hindered after he is ready for them. Besides, the most desirable varieties may be sold out in early season. New sorts should be tried only in a small way, depending for the main crop on those that are known to be reliable.....

WHEN the corn is shelled, the cobs are worth caring for, for various useful purposes, suggests Mr. Stewart. They make the best fuel for the smokehouse, giving the hams and bacon a delicate and agreeable flavor, free from the pungency of oak and other woods which contain much acid. When steeped in kerosene oil, they make good kindlings for fires, and they are equally good for this purpose when saturated with a solution of one pound of saltpeter in two gallons of water and dried. They then burn fiercely, giving out quick heat sufficient to kindle a coal fire. But they are also good for feeding, as they contain as much nutriment as straw, and where straw is scarce the whole ears may be ground together with advantage. The husks are still more nutritious, and may be ground up with the ears in appropriate mills made for the purpose. For feeding stock cattle and for fattening, ear corn in the husk is an exceedingly cheap and desirable food.....

MR. W. H. RUDD, an experienced poultry raiser, says, in the Massachusetts Ploughman, that he finds incubators very much superior to hens in every way. They are always ready, never forsake their eggs or exasperate their owner by any of the "ways that are dark and tricks that are vain" incident to the average sitting hen, but hatch the chicks on the very day they are wanted, free from lice, which is one-half the battle of raising them, and ready for the brooder, which contrivance he is vastly more successful with, even in midwinter, than he has ever been with hens..

MR. RUDD advises no one to embark in the poultry business at one bound. He has never known success to follow any plan but that of entering it gradually. Neither would he, as some do, advise commencing the business of raising poultry for market and depend upon hens to do the hatching and rearing until having become familiar with the incubator—because, comparatively speaking, only early market poultry is worth raising—and depending upon hens for this and upon the profits to support a family, is leaning upon a broken reed, and the person who thinks differently will discover the error after having tried it. If the incubator is to be dispensed with, much better rely upon eggs as the chief source of income and raise only enough chickens to keep the number of layers good. The cockerels which are sold will materially reduce the cost of the pullets. .....

THE point Mr. Rudd strongly emphasizes is this: Where one desires to prosecute the poultry business by natural means alone, rely upon eggs for the principal income, because it has been abundantly proven that there is a reasonable profit in it; but where the main income is expected from the much larger profit of dressed market poultry, and especially the early sales which bring twice or thrice or four times the prices of the later ones, do not attempt it except by artificial means, for it cannot be done except to a very limited extent.....

MR. RUDD keeps only Plymouth Rock fowls. Brahmas will drive the ordinary man to the almshouse before they begin to lay. When they are large enough for early broilers, they are all legs, and the leading hotel keepers who want broilers will not take them.....

MR. RANKIN has never raised any chickens naturally that were absolutely free of vermin. By hatching artificially, the chicks are free of lice and are not, therefore, stunted in their growth.....

MR. RANKIN says that cotton-seed meal is forcing and very good for hens. He always feeds a little of it.....

DENMARK is a great dairy country, the cows averaging about one to every two people. In six years the increase in the butter exportation has been about 200 per cent. Although a small country there are 200 co-operative dairies. Milk is paid for by the quantity of cream contained in it.....

ABSTRACTS.

——CENTURY FOR JANUARY: "To know others, study thyself; to know thyself, study others."

"THOU hast concealed thine age? Surely not thy folly!"

"THE surest way to drive honors from you is to go to them."

"WOMEN are more likely to love those whom they hate, than those who appear to them ridiculous. For of the ridiculous we deem ourselves the superior; but those we hate are seldom our inferiors."

——SUNDAY SCHOOL TIMES: "It is hard to tell which of the two is the more pitiable,—the over-nice reasoner, who never comes to any conclusion, or the vacillating, double-minded man, who never decides to act. He is like the farmer in the Book of Ecclesiastes, who is always observing the clouds and the wind to make sure of the exactly right time for his work. As 'the Preacher' says, that man will never sow and will never reap; or, as Sir Philip Sidney says, 'Whosoever, in great things, will think to prevent (anticipate and forestall) all objections, must lie still and do nothing."

"KIND hearts are the gardens,
Kind thoughts are the roots,
Kind words are the blossoms,
Kind deeds are the fruits;
Love is the sweet sunshine
That warms in o life,
For only in darkness.
Grow hatred and strife."

——GARDEN & FOREST: "THERE is no need of any more botanical gardens in the world run for the purpose of supplying bouquets and dinner-table decorations for the politicians who control the appointment of the managers; or to serve as a means for advancing commercial or private interests."

"It is well known that the varieties of potato most highly prized in England, will come to nothing here under out-door cultivation, and an enterprising marketman near this city has now growing in his green-house some Ash-leaf and Walnut-leaf Kidneys, in the hope that some one will pay him a dollar a pound for his tubers, on account of their supposed nutty flavor, or because they are strictly English."

——FARM AND FIRESIDE: "The Department of Agriculture, to attain its highest success, must be run on a basis entirely free from partisan politics."

——IDEM: "Turning over new leaves by everlastingly changing crops from year to year, is an operation that savors of gambling, with the chances against the gambler. If this has been your practice, it is high time to turn over another new leaf by quitting it. Stability and small, regular profits are better than the uncertainties—the high profits and perhaps the greater losses of the gambling-table."

——U. S. DEPARTMENT OF AGRICULTURE BULLETIN—Insect Life: "The RURAL NEW-YORKER potato contest has been decided and the RURAL Seedling No. 2 yielded at the rate of 1,076 bushels to the acre. No. 3 lost the day and was nearly a failure on account of the ravages of the common Flea-beetle, Crepidodera cucumeris. Probably the yield of No. 2 would have been greater but for this cause. This insect has been particularly destructive during the past season upon the Rural Grounds, confining its attack to the leaves and terminal shoots. It is now proposed to start a potato contest for ladies, the patches to be not less than one-fortieth of an acre. The details, however, are not fixed."

——FARM JOURNAL: "We have become a convert to the special food theory, and have gone back on *all* corn for making meat of any kind and especially for all young, growing animals. We mix bran, wheat or rye, with corn meal, and we do not give our animals any more of this mixture than we used to of clear corn meal, and they grow faster and do better. This corn meal notion is a big leak. We are glad to know that careful experiments verify these new ideas. Now, farmers, make an advance and feed less corn, and you will save money."

——"A LITTLE at a time and often," is a good rule to follow in oiling carriage axles.

——"DIP the points of nails and spikes in grease before attempting to drive them into hard wood."

——LIFE: "President-elect Harrison's pathway is strewn with flowers—forget-me-nots."

——PUCK: "De darkey's hour am jes' befo' day," said Uncle Aaron, as he invaded his neighbor's chicken-roost at 3 A. M.

——"THE PEOPLE who never get right in this world are those who get left."

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

Trees, Seeds and Plants.

If you want the best Garden you have ever had, you must sow

MAULE'S SEEDS.

There is no question but that Maule's Garden Seeds are unsurpassed. Their present popularity in every county in the United States proves it, for I now have customers at more than 31,000 post-offices. **When once sown, others are not wanted at any price.** Over one-quarter of a million copies of my new Catalogue for 1889 have been mailed already. *It is pronounced the most original, beautifully illustrated and readable Seed Catalogue ever published.* It contains among other things, cash prizes for premium vegetables, etc., to the amount of $3,500. **You should not think of purchasing any Seeds this Spring before sending for it.** It is mailed free to all enclosing stamp for return postage. Address

WM. HENRY MAULE,
1711 Filbert St. **PHILADELPHIA, PA.**

OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds

Earliest Cauliflower in existence.

D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* in the world.

D. M. FERRY & Co's Illustrated, Descriptive and Priced

SEED ANNUAL
For 1889

Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

D. M. FERRY & CO., Detroit, Mich.

Stayman's No. 1 Strawberry.

Large and Fine, produced at the rate of **30,000 quarts per acre. Price $2 per dozen; $10 per 100**

JEWEL the earliest and best black grape known. Equal to the Delaware in quality. **Price, $1.50 each. Send for testimonials.**

STAYMAN & BLACK,
LEAVENWORTH, KANSAS.

Pearl Strawberry. The handsomest, best flavored, most perfect-formed berry, best colored and MOST PRODUCTIVE. Ahead of JESSIE on the same soil and cultivation. 1¼ ACRES produced $743.87 worth of berries the past season Send for circ. Plants $10 per 1,000. *Fine Meeche's Quince and Apple trees* in abundance. WEST JERSEY NURSERY CO., Bridgeton, N.J.

200,000 TWO AND THREE-YEAR APPLE TREES, Hedge Plants and Apple Seedlings, at low prices. **BABCOCK & STONE,**
North Topeka, Kan.

XTRA Flat Dutch Cabbage Seed, grown with great care from only the most perfect selected Heads. Descriptive price-list of choice garden seeds free.
E. E BURWELL, Branch P. O., New Haven, Conn.

SEEDS Our sales in **1888** *double* those of 1887. Why? Because we sell only the *Best*, at Reasonable Prices.
SEED POTATOES, *large stock, great variety.*
Small Fruit Plants and Trees. Catalogue Free.
FRANK FORD & SONS, Ravenna, Ohio.

Beautiful Strawberries. We are now offering for the first time and only by us, the beautiful **Eureka,** and a strawberry that yielded at the rate of **127 Bushels** to the acre at one picking the past summer—60 other varieties; **80 of Grapes; Thompson's Early Prolific** Red Raspberry, the earliest of all; Palmer Rash the most productive early Black; **Thompson's Early Mammoth Blackberry,** etc., etc. If you mention this paper we will send you Catalogue free, telling about these beautiful berries & others Everybody wants it

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JANUARY 19, 1889.

"He who getteth himself honey,
Though a clown, he shall have flies.
In the end God grinds the miller;
In the dark, the mole hath eyes."

READ Prof. Porter's article on page 41, "The Yard-stick or the Plow."

And the game goes merrily on, while dairy farmers are defrauded of a large part of their just profit, and I suppose this will go on until the nations rise up in indignation and put an end to such unscrupulous practices once for all.—PROF. SHELDON, page 36.

"QUES.—Why am I a farmer?"
"ANS. –Because I can trust the Lord more, and people less for success in this business, above all others." J. M. Y.

What we complain of is the abominable fact that it was ever called by a name which identified it with the dairy. This it is that has done most of the harm to dairy farmers, for had the spurious stuff from the first been called by a name which properly and effectually disconnected it from the dairy, not a tithe of the mischief would have been perpetrated.—PROF. SHELDON, page 36.

DO NOT fail to read Mr. Terry's article on page 35. Every word of it, in the R. N.-Y.'s estimation, is true. It touches the heart with its evident sincerity while its forcible truths are spoken in the simplest, most touching manner. Thank you Mr. Terry—many thanks.

I know a man who once ate some of this stuff, toasted, at supper; he was hungry at the time, or he wouldn't have eaten much of it; he survived, but the Doctor declared he had had a close shave of it, and he has never tasted American cheese since.—PROF. SHELDON, page 36.

NO LESS than three potato originators have written us that the R. N.-Y. potato No. 2, is precisely the same as their own seedlings. "There is no doubt about it." No less than six persons have written us that the R. N.-Y. Trench System is their system. One says, "I began it 60 years ago."

You protect the skin, so to speak, of your great and noble country, and you tolerate a festering abscess in your vitals. Indeed, you Americans are a very funny people. You could crush a vast civil war, and you seem to be powerless against bogus cheese.—PROF. SHELDON, page 36.

THANK you, ladies, very much, for your interest in the Women's National Potato Contest. We can scarcely believe it. Souvenirs for all of you who produce creditable yields, are what we desire to secure. The eyes of the world will be upon you, ladies. Will you object to that? The Contest is a worthy one and will do good.

The process of liming may temporarily pay, but it is at the expense of the future, while we pay for the agent that does this permanent mischief.—See PROF. SANBORN, page 34.

DURING the past two weeks of damp, unseasonable weather, nearly every fowl in the neighborhood of the Rural Grounds has had the roup. A near neighbor who keeps about 75 hens and gives them excellent care, treats this disease with almost unfailing success, and this too without resorting to any medicine or roup nostrums whatever. The roupy bird is shut up in a darkened coop and the coop is placed in a warm part of the barn. She is fed nutritious food while thus confined, but in small quantity. Usually from three to four days of this treatment suffice for a complete cure.

FIVE hundred bushels of potatoes *on an acre of impoverished* soil is what the R. N.-Y. expects to raise next season under the Rural Trench System, aided mainly by fertilizers. Let us see. It further expects to raise at the rate of over 700 bushels on one-fortieth of an acre. It further proposes to raise over 100 bushels of shelled corn on a measured acre, as 10 years ago it averaged more than that on five acres.

THE best vegetables, new and old, including celery, cabbage, lettuce, beets, Brussel's sprouts, borecole, carrot, celeriac, cucumber, egg plant, garlic, onion, leek, mushrooms, radish, spinach, okra, peppers, rhubarb, squash, tomato, pumpkin, peas, beans, sweet corn, cauliflower, celery, etc., etc., *early and late for field and garden.* These will be treated in a *Special* soon to appear, by the best practical writers of the country.

THE R. N.-Y. considers the article by Mr. Terry, on page 35, one of the most eloquent and admirable tributes it has ever seen. It is true, every word of it, and we venture to say that there is hardly a right-minded, fair-thinking man who will not acknowledge its truth.

"Have confidence enough in each other's judgment to ask no questions about little amounts. Have the pocket book as accessible to one partner as to the other. No true woman will ever abuse such a partnership, and there are more true women in this world than there are true men."

Right you are, Mr. Terry, just as right as you can ever be. Well said. The writer of this is not at all ashamed to say that his wife is just as good a financial manager as he is, just as well able to handle every cent of money belonging to us, and a great deal better able to manage any expense that has to do with household matters.

THE R. N.-Y. is going to see how much corn it can raise on a measured acre; how many potatoes on a measured acre. Then the ladies of the R. N.-Y. have entered for the Women's "Potato Contest." Again it is going to try to raise at the rate of over 700 bushels of potatoes per acre on more than double the area of last year's "Contest" plot. It hopes also to print many reports as to the R. N.-Y. No. 2. (from the little specimen sent to each applicant-subscriber), that will show it to be the best late or intermediate potato in existence. It also further hopes, should the Flea-beetle be kept in check, to show that the R. N.-Y. No.'s 3 and 4 are the biggest yielders of all varieties at present known, while the quality is extra fine. It still further hopes to send out a few grains of six different kinds of its hybrid rye and wheat and cross-bred wheat plants, and that a number of other varieties will have become so fixed as to be ready for dissemination another year. We have great hopes from these new varieties. Oh! it hopes for lots of things from the New Year. It is anticipating lots of fun for itself and for its good readers. It is altogether happy, and would gladly aid in making them happy as well.

LIEUT. GOVERNOR JONES ACCEPTS.

THE R. N.-Y. solicited Lieut. Gov. Jones to act as one of the judges in the R.N.-Y.'s potatocontest next summer. His reply is as follows:

"It will afford me a great deal of pleasure to serve as one of the judges at your next potato contest."

Our next potato contest promises to be a matter of no little importance, and it is desirable that well-known people be selected as judges, so that there may be no manner of doubt as to the impartiality of their report.

There will be three plots. First, the full acre plot of irregular ground and an impoverished soil; second, the Women's plot, and, last, the *regular* contest plot, which will be twice as large as that of last year. All are to be treated strictly in accordance with the R. N.-Y. Trench Method.

A NOTE FROM PRES. BERCKMANS.

"THE next session of the American Pomological Society will be held at *Ocala* (not Sanford), Florida, Feb. 20, 21 and 22. There will be a large attendance, judging from many lettters I daily receive. In a few days I shall be able to announce that reduced rates have been secured from railroads. The Ocala people are doing everything possible to entertain their friends and they hope to welcome many from every section."

P. J. BERCKMANS.

THE WOMEN'S NATIONAL POTATO CONTEST.

ESTIMATED value of souvenirs contributed up to January 10th, $850.00

H. L. BARRICKLOW, Rising Sun, Ind. $5 in grape-vines and ornamental shrubs.

G. W. FRY, Dunlap, Mo., a choice of a setting of eggs of either Silver Wyandottes or R. C. B. Leghorns.

NORTHRUP, BRASLAN & GOODWIN Co., Minneapolis, Minn., $10 in any kind of seeds from their 1889 catalogue.

GEO. B. LORING, M. D., Washington, D. C., $5.00 in cash.

W. B. ALWOOD, vice-director of the Virginia Experiment Station, $5 in cash.

M. MURRAY, Centre, O. Five premiums, each consisting of two pounds of Ross's Favorite potato (new).

S. FROGNER, Herman, Minn., $20 in potatoes, as follows:

10 prizes of one *peck* each of Early Minnesota (new.)

10 prizes of one pound each of No. 18 (not for sale.)

10 prizes of one pound each of No. 64 (not for sale).

10 prizes of one pound each of No. 50 (not for sale).

The pound prizes to be sent postpaid; the peck to be sent by express at recipient's expense.

JONES, OF BINGHAMTON, N. Y., $10 in two platform scales.

WHY NOT?

AND there is not one, as yet, to accept of the RURAL's wager. What's the matter with you, good people? The money will go to a charitable purpose. *Probably* the R. N.-Y. will be defeated. It was defeated last year, and now, on a plot more than twice as large, it wagers $50 or $100 that it will next year raise at the rate of over 700 bushels of potatoes to the acre. Why not accept it, friends—you who have money to give away to some worthy charity? Let the season be what it may; in spite of insect depredations; in spite of too much rain or of drought; in spite of poor seed, of varieties that may not yield well—in spite of *anything*, the RURAL is willing to wager $100 that it will raise *seventeen and a half* bushels of potatoes on one-fortieth of an acre. And we propose to do it *economically. What can be done on one-fortieth of an acre can be done on an acre if the same conditions are secured.* It is our intention to plant an acre also, and in 1890 to make the same offer for the acre that we now make for the smaller area. The land is at present rough, uneven and impoverished. We shall do our best with it *next spring*, and see how large a yield may be obtained under the Rural Trench System, faithfully reporting the results to our readers. Meanwhile, friends, we are waiting for you to accept of our *present* wager, and it is difficult to see why it is not readily accepted. Please tell us of an authentic record where as many as 17½ bushels of potatoes have been raised on an area of 1,089 square feet.

FIRST SEVERE BLOW AT THE TRUSTS.

THE first severe blow against Trust monopolies has just been delivered by Justice Barrett, of the New York Supreme Court, in a luminous decision against the North River Sugar Refining Company, one of the most important members of the Sugar Trust. Before the organization of the Trust, the sugar refineries of the State were conducted both by corporations and partnerships. To form the Trust, all the partnerships were turned into corporations, which agreed that all the shares of their capital should be transferred to a Board of Trustees consisting of 11 persons. The share-holders did not sell their interests, but received in exchange for their deeds "trust certificates," just like the certificates of stock in any corporation. The Trust consisted of all the refineries in New York State together with the most prominent concerns in other States, and its object was to prevent competition and control prices. The directors of each of the original corporations became mere agents of the Trust, and each corporation paid over the profits of its business to the board of 11 men, and from the aggregate profits dividends were declared on the Trust certificates.

Corporations enjoy certain privileges from the State, and are amenable to its laws. By joining a Trust, which is in the form of a corporation though it is not one, they shirk their obligations while retaining their privileges. The Judge decides that the company has forfeited its charter because it went beyond its corporate powers in merging itself in the Trust. He bases his decision on no particular law, but on the broad principle of "plain law and plain sense" that the law is able to protect itself against such abuses of the privileges it grants, "which, if allowed to thrive and become general, must inevitably lead to the oppression of the people, and ultimately to the subversion of their political rights". The application of this principle of common law is not confined to the State of New York, but extends to every State in the Union. It is difficult to overestimate the importance of this decision, should it be sustained by the Court of Appeals, to which the case is sure to be taken. True, it applies only to corporations forming Trusts, while that exemplar of all Trusts, the Standard Oil Company, declares it is not affected by it, as it is composed, not of corporations, but of individual stock-holders. While, as Judge Barrett suggests, "further legislation, both preventive and disciplinary," is desirable "to check and punish" the wrongs done by these monopolies, it is a cause of thankfulness to the general public that so trenchant a judgment has now been rendered against them, which may serve as a wholesome precedent in other cases and in other States.

BREVITIES.

READ what Dr. Kilborne says about yellow pork, on page 37.

JANUARY 10, and no frost in the ground. Potatoes are sprouting badly.

"'WHY DO I FARM?' To my mind the main articles in the Thanksgiving Number answer that question pretty well."

"THERE is a point or two in this potato seed business not generally known." See Mr. Falconer's article on the first page.

MR. PRATT, on page 36, ascribes a portion of the loss in the average butter production of his herd to a change of milkers. It is certainly remarkable how much difference in a cow's yield a new milker can produce.

MR. HOWARD, page 37, outlines a plan for a poultry experiment. Wouldn't the soil of that field be rich the next year? Speaking of poultry experiments, when are our experiment stations going to try something of the kind?

MR. HODGEMAN, on page 35, gives the history of a very successful farmers' organization. Is he right in his guess that the managers of the N. Y. State meetings are trying to "heat the mass from the top?" Think this over.

THE experiments on feeding steers of various breeds, conducted at the Michigan Agricultural College, aroused considerable interest among cattle-men. Now it is proposed to conduct a similar experiment with sheep of the different breeds.

YOU will notice that the first of the experiments as to the weight of milk required to make a pound of butter, is recorded this week under "Discussion." In this case it required 18 2-13 pounds of milk to make a pound of butter. Can your cows beat this record?

Field Crops.

THE SWEET POTATO.

A sweet potato convention suggested; the need of it argued; sweet potatoes in the Gulf coast country; the patches a brilliant display of flowers.

THE sweet potato has many strongly-marked and permanent varieties, but when one hears or reads of them by name, he cannot at all feel certain of what he is hearing or reading about, owing to there being no settled nomenclature for the different varieties of the product. In traveling over the Southern States you will find the same variety sailing under a different name in almost every settlement, usually going by the name of the man who first introduced it there, or the name given by him, or that of the man who is making a specialty of it. For instance, we have a pale red variety known here as the Musgrove, there as the Dooley, at the other place as the Hayti Yam, and in still another place as the Red Bermuda, and so on. Under such circumstances, it would be impossible to order the variety from a distance with any certainty of getting what one wanted. I have often urged the people interested in sweet potato culture, to hold a convention for the purpose of establishing a regular sweet potato nomenclature. I think the existing inconveniences, as just hinted at, certainly demand it. Nothing we cultivate on so large a scale as we do the sweet potato in the South lies under such perplexing uncertainty as to names of established varieties.

The sweet potato is one of the very important products of the country lying along the Gulf of Mexico east of the Mississippi River, and along the lower Atlantic further east. It is the easiest crop to raise that the Southern people grow. The yield is enormous. With comparatively little attention, it gives us a yield of from 200 to 400 bushels to the acre, and the trouble of keeping it over to the next season is scarcely worthy of mention. We throw the potatoes up in heaps of 15 or 20 bushels, in the open ground, place over the heaps a few inches of straw, (usually pine straw,) and over the straw a few inches of earth, and the work is done. They will be found as sound and good there next May as when they were first "banked," as we call it.

To-day (November 27), the people of the Gulf coast region are busily digging their sweet potatoes. The yield for the season is very good, as a rule. There has been no frost to touch the vines up to this date, consequently the patches are regular flower-gardens, so to speak. To the Northern sweet potato grower, who is not thoroughly informed relative to the peculiarities of the crop down here, this mention of flowers will be something of a surprise. The sweet potato is a heavy bloomer with us, beginning to show its flowers about the last of July, continuing till frost. The flowers are of a pale blue color, and much resemble those of the small-flowered morning-glories. In some seasons the flowering is heavier than in others; the present has been one of those heavy-flowering seasons. So numerous are the flowers on the vines of a patch now in sight from my window, that the entire surface of the growth presents a bluish shade. Freely as it flowers in this region, the sweet potato does not appear to mature any seed. I have never yet been able to find a single perfect seed pod.

Mobile, Ala. J. P. STELLE.

Educational.

THE YARD-STICK OR THE PLOW?

PROF. D. G. PORTER.

Supereminent opportunities for cultivated enjoyment on the farm; incitements there to individuality and independence; absence of harrassing anxieties; the grim struggle with Nature tends to develop heroism and manhood; farming viewed from different standpoints; education as an attractive, not a repellent force on the farm; agriculture an excellent business opening; increased facilities for success in it; "American husbandry the ideal of human occupations;" need of full special winter courses for farmers' sons at agricultural colleges.

I WISH to make an emphatic indorsement of the RURAL'S advice to the sons of farmers who think of abandoning the farm in order to become clerks, bookkeepers, etc. I said in a recent communication that there is no industrial occupation which offers such natural facilities for education as farming.

I now say that there is no situation at all accessible to the industrial classes, in which a man can so well enjoy an education as in agricultural and rural life. To the educated man there is a constant delight in the association with nature, which the farmer enjoys, in the infinite variety of plants and trees, animals and birds, in the magnificence of mountain and meadow, forest and stream, in the changing beauty of the day from dawn to star-light, in the grand procession of the heavens, in the quiet beauty of evening and the grandeur of storms. All these education fits the farmer to enjoy, while to the dweller in cities, whether educated or not, they are largely a matter of theory in which he has little actual experience.

There is also an element of largeness and liberty about country life, which is well calculated to develop individuality and independence of character; so that a man accustomed to it feels an uncomfortable sense of closeness and repression in the city. There is also a material independence connected with farm life, which men in other situations can seldom enjoy; and material independence is in most cases a necessary foundation for independence of thought and action. If the farmer does not get rich, he at least does not fail, as a large majority of those who enter on business careers do, and he knows that no one can disturb him in the possession of what he has.

Again, the farmer is free from the burden of wearying, harrassing anxieties which has driven many a city man to his grave, especially if his sons stay on the farm with him instead of leaving him to depend on such strangers as he can pick up, for help. Then there is an element of heroism in country life, which the knight of the yard-stick seldom has an opportunity to develop. Heroism in man is always associated with physical achievement of some kind. In summer's heat and winter's cold, in the labors of forest and field, in the competition of manly sports, in the mastery of beasts, in buffeting with Nature in her sterner moods, there is opportunity for real, heroic achievement, such as commands the approval of men and the admiration of women, and tends to make a man satisfied with himself. Nature often opposes a stout, but kindly resistance in order that her children may grow strong and heroic in the encounter; and the element thus developed is of high value as a factor of genuine manhood. But it must be remembered that many and many a time it is education, mental culture and elevation that make the difference between heroism and drudgery. To one man his occupation is irksome, and has only a sordid significance; to another the same occupation is a pleasure in itself, and the opportunity of a noble development. It is the spirit in which a man takes up his walk that makes the difference, and this spirit is largely a matter of education, culture, and breadth of mental vision.

The fear is sometimes expressed that education would take the farmer's sons away from the farm. This in my opinion is a groundless fear. I admit that once the tendency and the object of education was to take boys away from the farm, and to fit them for professional life. But we have already passed that stage. The idea now is, and should be, to educate the man; and education is valuable wherever true manhood is honored. Especially should the American agriculturist be an educated man. His position in life requires it. He is not a tenant at the mercy of a landlord. He lives in independence and comfort on his own domain, and is rearing and educating a family. Every atom of education he can obtain will come in play. It is better that the labors of the field should be enlivened by discussions on history and science, than that the conversation should be mere idle, unelevating gossip as is so often the case; and the farmer's home should be a center of culture, where literature and art should be familiar topics.

As regards the business aspects of the case, the RURAL has well pointed out that there are already hundreds of candidates for every possible chance of a clerkship or other similar position. Indeed, the rush in these directions reminds me of the remark of a distinguished English visitor that for every American trying to get a living by honest labor, there are about six others trying to get rich by speculating on him. A condition that could even suggest such a criticism is not creditable or wise. And it should be remembered that the possibilities of American agriculture have greatly increased, while opportunities in these other directions have diminished. There are now improved agricultural machinery, commercial fertilizers and the silo, each of which has diminished the toil and increased the profits of husbandry. There is organization to protect farming interests and to increase the intellectual and social attractions of farm life. And, above all, there are the natural educational facilities not yet developed, but which, when developed and improved, are capable of making American husbandry the ideal of human occupations, the best field in which to rear and train a noble race of American citizens. I agree with the RURAL in thinking that these considerations should be urged, and that more of our young men should thus be kept on the farm or brought back to it. There are already enough "deserted villages" in the country, especially in New England, as a result of the movement of our populations towards the cities.

> "And a bold yeomanry, their country's pride,
> When once destroyed can never be supplied;—"

or can be supplied only with an incongruous foreign element whose rapid increase already threatens the permanence and predominance of American ideas.

There is many and many a farmer even now in our Northern States, who can easily and speedily realize the poet's ideal of

> "Culture's charm and Labor's strength
> In rural homes united."

Does any one ask how this can be done? Let me say, in reply, unite with your brother farmers in asking the managers of your State university, endowed in part by the Morill Land Grant and for your especial benefit, that they provide for your sons, not an agricultural course of a few months, but a regular academical college course, to consist of at least four winter terms commencing the 20th of October and closing the 15th. of April. These terms will include from two-thirds to three-fourths of the work of a whole college year which in any case consists of less than 200 days of study; so that your sons in this course will not fall so very much behind those who have had the whole year for study, while their expenses will not be more than one quarter as much, considering the value of their services on the farm in summer.

You will probably get the college course proposed as soon as your sons are ready; for the principal difficulty will be in getting them ready to enter. But the conditions of admission will not be severe at the start, and some of your sons will "get there" if they have half a chance. One term at college will make a decided difference with your boy. He will bring the college atmosphere with him when he returns to work in the summer. His brothers and sisters, and you yourselves will be interested in his college studies and his college life. When he and his class-mates have graduated, by teaching in the district schools in the winter, they can make these schools answer the purpose of preparing for the college course such of the rising generation as desire it; and under these circumstances, what a race of educated, cultivated men and women the rising generation of farmers' sons and daughters will become!

Brother farmers, this is your opportunity; see that you improve it This is the educational birthright of your sons and daughters. Do not barter it for a mess of pottage.

New Haven County, Conn.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

MOST people of narrow means who are gifted with generous instincts feel their poverty most acutely when they wish to give, not only charities, but little tokens of friendship and good-will. Especially is their poverty felt at Christmastide. We read recently of a Japanese family who for many generations have pursued a simple plan for providing money for such uses. Setting aside a money box for the purpose, they put in it the surplus from unnecessary expenses. Thus, if they decided to spend four dollars for a robe, they would try to purchase a plainer garment, and put the money saved in the box. The same with food or luxuries of any kind, the means thus secured being devoted to charitable purposes. This they called an offering to the Great God of Unselfishness.

* * *

How very few people are too poor to do something of this sort. The plan may also be recommended to those who are anxious to put something by for a rainy day, and yet feel unable to set aside a regular amount. Whenever a nickel or dime, or a quarter seems likely to be spent for something foolish or needless, drop it into the box. We object most strongly to parsimony or avarice, but there is so much extravagance on the part of the people in moderate circumstances that one cannot too strongly urge the necessity for prudence. Of course, the savings must be very small, on the part of many. But a girl might, now and then, "scrimp" on the price of a ruffle or a ribbon, or drink water instead of soda when shopping; she would be none the worse at the time, and later she would feel the benefit of her little self-denial. Why not begin it now, and see if you do not feel the advantage when buying your next Christmas gifts?

* *

WE are apt to regard the country as the abode of rugged health, and it is a little discouraging to read a recent paper by Dr Lucy M. Hall on "Sanitation in the Country." She began by describing a typical country house surrounded by dense shade trees, producing gloom and mold; with the best parlor always shut up closely, lest the carpet should be faded by the sunshine, or the furniture specked by a fly; with small, ill-ventilated bedrooms either in the middle of the house or on the cold and dark northern exposure; with the well in the house or very near it; with the outhouses joining the main building or in close proximity; with a cellar uncemented, damp, and often wet, and with the kitchen garbage thrown out near the house.

The lecturer declared that many country housewives were afflicted with a mania to keep out sunlight. She said that pale and ailing women among well-to-do country people exceeded any other class. These women take no out-door exercise of any kind, and the result is an appalling array of pallid daughters and narrow-chested sons.

She suggested as a remedy for these evils that country houses should be built with large and sunny living-rooms, and shade trees at a respectful distance; with wells safe from the drainage of earth-closets and stables, and all the out-buildings remotely situated; with bed-rooms on the second floor; with cellars cemented, and extended under the entire house; with temporary awnings instead of permanent projecting porches, and with everything constructed upon sound hygienic principles. As a remedy in existing houses, she suggests open windows, plenty of sunshine, the removal of gloomy shade trees, and the demolition of contiguous barns, pig-stys, henneries, and other offensive out-buildings. In addition to this, there should be a better education in sanitary matters. Many of the assertions made in this lecture seemed sweeping, but it is an undoubted fact that we need greater attention to hygiene in country life. Fresh air, sunlight, and out-door exercise are three necessities greatly neglected by many country girls and their mothers, and in spite of their cleanliness and industry, a good many sanitary precautions seem neglected or out of the question.

OUR ARTIST'S "FRENCH HEELS."—The RURAL is an excellent paper and it is an honor to the American farmer and fruit-grower. But I want to protest against the French heels which its artist, Mr. Berghaus, has been allowed to introduce into the progressive farmer's family of late. In the very suggestive and excellent cartoons published for Thanksgiving and New Year's Day, he has shown the farmer's wife and the little daughter as wearing the abominable French heel shoes, thoughtlessly perhaps and without design, but the lesson is just as unwholesome for all that.

These pictures are doubtless studied by a very large circle of readers, and because the RURAL seems to say so, many will be apt to think French heel shoes are all right. But I don't believe the RURAL means to sanction any such thing. It is not in harmony with the sound and sensible principles which seem to underlie its whole conduct. Don't let us condemn the farmer's wife and daughters to

A GOOD DIGESTION.

"Where be your gibes now? your gambols? your songs? your flashes of merriment, that were wont to set the table in a roar?"

HAMLET.

HOW many of you have ever connected cheerfulness and merriment at meal times with a good digestion? And yet, not even good cookery has a more pronounced effect on the digestive organs than happy thoughts and pleasant speech while at the table. This is strongly exemplified among my friends, the Quinbys. There never was a more jolly, or a more healthy family. Happiness and health beam in every countenance from ruddy-faced Mr. Quinby who seems a sort of personified chuckle, to the crowing, dimpled, year-old baby, Toddles. A meal at their house is an episode never to be forgotten—the merry quips, the bad puns, which seem the funnier the worse they are, the general air of contentment and good nature, make an impression not easily removed. Five sons and five daughters, and all as harmonious as birds in a nest, I was going to say, but any one who has watched a nest full of struggling, pushing birds, each trying to get the first worm, will agree with me that the author of "Birds in their little nests agree," is not to be commended either for his knowledge of natural history or his veracity.

At the house, by mutual consent every unpleasant subject seems to be dropped out of sight and mind during meals, and although nothing better than a "dinner of herbs" frequently graces their board, there is always "contentment therewith." No worries are ever discussed at such times. Even a dish that has suffered at the hands of stupid Gretchen, instead of being greeted with frowns and ill-natured criticism, becomes a theme for fresh jollity.

But what a different atmosphere at the Rawleys Mr. R—. bemoans his losses, his expenses, or his debts, scolds his sons, nags his daughters and complains of the food. Mrs. R—. who doesn't believe in letting "a man have everything his own way," laments that her house is smaller, and her furniture shabbier than that of the Smiths who live across the way. She discusses the shortcomings of her servants, and the disobedience of her children, and the children, not to be behindhand, indulge in many a side squabble.

"Breakfast," says Leigh Hunt, "is a foretaste of the whole day. Many a meal that has every other means of enjoyment, is turned to bitterness by unwilling, discordant looks, perhaps to the great misery of some person present who would give and receive happiness if at any other table."

I do not wish to bore you by going into the medical science of a fact with which any physician will acquaint you, namely, that cheerfulness during a meal promotes digestion. You can prove or disprove it for yourself by simply trying it for a season. If you have been used to finding fault with your wife's cooking, try praising it by way of a change, and note the result. ALICE CHITTENDEN.

ABOUT WOMEN.

IN the Women's Training College for Teachers, in Cambridge, England, recently, a school of scientific carpentry has been started. The young ladies are trained in the use of tools one afternoon in the week. No attempt is made to teach a trade, says the Builder's Journal, but only an effort to develop a certain degree of manual dexterity on the part of the young women. The experiment has been so highly satisfactory that Miss Hughes, the principal, says:

"I cannot speak too highly of the educational value of scientific carpentry. I am delighted with the result here, although we can spare very little time for it. The relief from mental work is immense, the exercise excellent (one rule is, we learn, to saw equally well with the left and right hands so as to develop both sides of the body equally), the pleasure is very great, and the powers of observation, accuracy and common sense that can be developed by this manual work are simply marvelous. It is also the very best possible training for a future technical training."

Verily I see before me a millennium when every woman, as well as every man, will be not only the architect of her own fortune, but of her house as well—when we shall become so self-helpful that men will no longer be necessary, and when in order to find grace in our sight they must reach a higher standard of perfection than many of them have yet attained to. Husbands will learn to speak gently to wives who can handle an adz, a saw and a hammer as easily and dextrously as a rolling pin or a flat-iron. They will, on the other hand, have fewer compunctions about letting us split our own firewood.

Jesting aside, however, this new departure, although perhaps not pertaining to the "higher education of women," will undoubtedly prove more useful to the majority than a knowledge of Euclid and conic sections. Little things about the house are continually going to pieces for the want of a little timely carpentry, that Jack either has not the time or skill to attend to, for there are nearly as many men as women, who literally cannot drive a nail.

A CHICAGO paper gives a picture of a "lady of the old school," that every girl must be the better for having read, and which we subjoin:

"The mysteries of the kitchen had no terror for her, and she fully understood the art, as one of the old cook books expresses it, of 'shaking hands with a saucepan.' Her table linen was spotless, and every plate and cup and saucer, every knife and fork, every piece of glass and silverware, gleamed in resplendent purity As she sat at the table, opposite the gentleman of the old school, and surrounded by her family, her face was a benediction, for happiness had its abode with her.

Under her firm and womanly hand her children were dutiful, her servants respectful, and her husband, safely trusting in her, gladly gave her his love and praise. But if she was mistress in the kitchen, she was queenly in the parlor. There she received her friends with an ease and grace that made the most awkward easy and graceful, each one reflecting, as in a glass, her own charms. Many a bashful young man and many a modest maiden have called her blessed because her fine manners did not chill, but rather warmed them into animation and life. Her fine tact left no guest, however humble, obscure or in a corner, and none ever left her presence without feeling how much wittier they were than they had supposed. Her dress was not more costly than her purse could buy, and was as appropriate to her as the plumage to a bird. Its very detail harmonized so perfectly that it was almost indescribable, and the only impression it left on the beholder was that she was well dressed. Serenity shone from her eyes and contentment smoothed every feature, and although the trials of life came to her as they came to all, she ever endured them with religious patience." PALMETTO.

GOLDEN GRAINS.

DR. BEHRENDS doesn't approve of the popularity of Robert Elsmere. He says it is a house upon the sand, a beautiful bubble, collapsing at the first breath of earnest protest. The world has no need of such a substitute for the old historic gospel.....

"CHARITY to a man's own soul is the very soul of charity" is a saying we have read somewhere, and it is true. All that a man does or thinks or says has its reflex action on himself, hence no act of charity to others can help but be an act of charity to a man's own heart.....

WE are not worse at once—the course of evil
Begins so slowly and from such slight sources
An infant's hand might stem its breach with clay;
But let the stream get deeper, and Philosophy—
Aye, and Religion, too—shall strive in vain
To stem its headlong torrent. —*Scott.*

ARTIFICE is incompatible with courteous frankness of manner. Rochefoucauld has said that nothing so much prevents our being natural as the desire of appearing so.....

WE are apt to forget our duty toward our immediate relatives and friends. Dean Stanley says that each one of us is bound to make the little circle in which we live better and happier; each of us is bound to see that out of that small circle the widest good may flow; each of us may have fixed in his mind the thought that out of a single household may flow influences that shall stimulate the whole commonwealth and the whole civilized world.....

"HE most lives who thinks the most,
Acts the noblest, feels the best,
And he whose heart beats quickest
Lives the longest, lives in one hour
More than in years do some whose
Fat blood sleeps as it slips along their veins"

THE CHRISTIAN UNION says that the men who give their work character, distinction, perfection, are the men whose spirits are behind their hands, giving them a new dexterity. There is no kind of work, from the merest routine to the highest creative activity, which does not receive all that gives it quality from the spirit in which it is done or fashioned. Work without spirit is a body without soul; there is no life in it.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

One of the best resolutions for the young year that we know of is to try to make some one happier each day. You may not always succeed, but the effort is well worth the trial, for he or she who maketh the effort bringeth happiness unto his or her own soul.

WINTER WARMTH.

MARY WAGER-FISHER.

TO keep the blood up to its normal heat in winter, is the secret of warding off the long line of ailments that result from getting cold, or chilled. This can be best accomplished by warm clothing and good circulation. It sometimes happens that the flannels are thin, and to buy new ones is not within the compass of the family purse. But even with worn underwear much can be accomplished by basting warm linings across the shoulders, both front and back, and protecting the top of the arms and knees in the same way. Some of the best ready-made woolen undergarments are woven so that both the chest and the abdomen receive a double layer of the fabric. For boys and girls always in a hurry—the kind that rush out-of-doors without top-coats in cold weather—warm clothing is such a safeguard against pleuritic attacks, inflammation of the lungs and throat, etc., etc, that there seems to be nothing better in the way of household economy than to make these youngsters proof against sudden chills by judicious padding. For sleeping, the night-gowns should be warmly lined across the shoulders, or people should wear, over the gown, a woolen sack or jacket, which warm garment for the shoulders and arms will save much discomfort and even illness in the case of sleeping adults who are not over-robust. The human body is weakened by every cold which attacks it, and to keep it free from ailments of every kind, is to keep it strong and hardy. It is not necessary that clothing should be fine or costly to be warm; but warm it should be, even if patched and ugly to a startling degree. Some one has said that one had better be a fool than be dead!—and it is certainly better to look like a guy than to suffer from the cold. Women who are much in-doors need especially to protect the neck, the sides of the face about the ears, when going out in cold weather, and it is much more sensible and profitable to wear a hood than a bonnet or hat in winter-time when riding or driving. A newspaper, folded and laid across the chest under the coat, when one is to face a biting wind, is a great protection to the lungs.

The evil so many women have felt of the insufficient warmth afforded to the legs by petticoats, has led to the discarding of under petticoats altogether. The lower part of the body is clad very much as men clothe theirs, with warm woolen drawers coming to the heels, over which the stockings are drawn, and then another set of over-drawers or pantaloons of still greater warmth of cloth, or wadded silk or cotton, as one can afford. The external appearance of the non-petticoat wearer does not differ from that of the much petticoated woman, except that she is freer and more graceful in her movements, and is relieved of the heavy, bunchy look that petticoats give. A woman who has no pattern to guide her in making these pantaloons for herself, can experiment with a cast-off pair of her husband's or brother's trousers, cutting away all the unnecessary appendages, and, of course, having the garments well washed and ironed. Her own should fit smoothly around the hips, and reach to the top of the shoes. Some ladies have them made of quilted silk, and some cut them from their quilted petticoats. They are such an improvement in dress in the way of comfort and health and of modesty, too, that they will win their way speedily.

Winter bathing is also very essential for warmth and health. A substitute for bathing is friction applied to the skin by means of a brush, rough mittens or towels. Standing on one's toes is a good exercise for warming the feet, slipping off the shoes for that purpose. This is good for the feet before retiring, if a quick cold bath is too violent for them. The virtue that lies in a rough towel is rarely appreciated. The vigorous use of it is worth all the cosmetics in the world as a beautifier. A daily hand rubbing of the arms, neck, cheeks, chest, indeed, of every part of the body, will keep wrinkles, flabbiness, weakness and pains at bay, as nothing else can. The pores are kept open, the tissues are healthy and hardy, the blood tingles with life, the flesh forgets to grow old, the teeth and nails are polished by it; in fact, when rightly and persistently used, the rough towel is worth its weight in gold.

One of the best exercises for every lady in need of chest development, is the use of Indian clubs. They can be made at home without cost, and in nearly every neighborhood some one can be found to show one of the best ways to use them. For a narrow-chested, round-shouldered boy or girl they are excellent. Another good exercise can be had by standing in the corner of a room, and with the hands on each of the two walls, inclining the body into the corner, so that one's very nose fits into the angle. Repeat this operation 20 times in succession to begin with. Children quickly catch the knack of doing it, and it brings their shoulders back beautifully, and is an ever-ready expedient.

To allude again to the friction produced by rubbing, I have known sore throat, earache, neuralgia, etc., driven off, when, at the outset of the attack, vigorous rubbing has been applied about the affected parts.

The cut-off legs of worn-out stockings, drawn over the stockings that are worn, form very good knee protectors for children much on their knees. The under sides of the cut-off legs are usually little worn, and should be turned to the front. Economical women buy children's stockings of the same color the year round. Creeping bags are made for infants, of calico, in two widths, of the length of the child from the neck to the heels The top end lets the arms through the side seams, and is gathered into a band large enough to slip easily over the head. The bottom end has slits cut for the feet to come through, or the bag may be cut up through the center a little way, and each side gathered into a band to fit around the ankle. It is reversible so as to be worn either side to the front.

CIVIL GOVERNMENT IN SCHOOLS.

LEILA S. TAYLOR.

ONE branch which I am glad to see is being added to the course of study in many High and Grammar Schools, as well as academies and private institutions, is civil government, or the science of statesmanship. It might well be introduced into all district schools, and should be required wherever there are boys or girls near the dead line of 15. If our country ever needed wide-awake, well-informed American citizens it is now, and the years to come will probably only increase the necessity for them. How few of those whose ballots determine the nation's fate understand her history, appreciate her mission, or foresee her dangers! How few realize the character of her constitution, or the nature of her government! What can the German, or the English, or the Irish, or the Swedish man, fresh from his native soil, know of our polity? The sons of these men go to our schools and there must they learn, if they ever do, the history, nature and requirements of the government their parents have given them as a birthright. Let our school committees see to it that no boy nor girl goes out from our country schools, till the principles and methods of the State and National Governments are understood.

There are several good text books on civil government. Among the best, are Townsend's and Martin's. First, the idea of government is explained and illustrated. The State is defined; law, penalty, and the different kinds of government are discussed Then follows a brief historic sketch of the growth of English law, and its development through colonial history, until its final crystallization in our present constitutions of the States and Nation. Then the different departments of the government are taken up, and discussed in their various forms and functions. The nature of the town, county, and State, with that of their numerous offices, and requirements is explained.

One method which may be employed by any wide-awake teacher, is to take the pupils

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

to a town meeting, and afterwards discuss it with them, step by step, thus giving them an object-lesson in civil form. Get town documents, an old warrant, for instance, and talk over each phrase and item. The science of government is discussed in these text-books, but, more than that, and of far more importance, the sacred obligations of citizenship are enlarged upon. The position and obligations of the citizen of a State are plainly enforced.

His rights and duties are clearly defined, and it is impossible for a conscientious and patriotic teacher to handle these themes before a class of bright boys and girls, without making them feel that it is a noble and sacred thing to be an American citizen.

If, in all our schools, are taught the relations and obligations of State and citizen, it will go far toward removing the present blindness and ignorance of the voting classes. Boys and girls will grow up educated not to scorn or slight their responsibilities as American citizens. If anything stamps a young man as empty-headed and weak-kneed, it is to hear him prate of political corruption and brag of his indifference to public affairs, boasting of being too clean to dabble in politics. It is like calling himself too clean to go and help his old mother cut of a mud-puddle into which she had fallen.

I never hear a young man speak in that way without wishing he could be left to the tender mercies of a mob or a commune.

One corrective of this false, unmanly, and un-American foppishness is this early training in the common schools. It is a good theme for family reading. Get a text-book, fathers and mothers, and in these long winter evenings read aloud and talk it over with the children, fitting them yourselves for the days and the duties that are to come.

BEAUTIFYING THE COMPLEXION.

WRITING of fine complexions, Harper's Bazar says that a clear, fresh complexion gives a look of cleanliness to the person possessing it, and the practice of cleanliness will best accomplish this result, as there is no beautifier equal to the daily tepid bath. But *any* water will not do, and hard water is almost worse than none. If not naturally soft, it should be made so with ammonia or borax. That wonderful old lady, Diana of Poitiers, who persisted in being beautiful at such an unreasonable age, is said to have used no cosmetic but a daily bath of rain-water. This is a wonderful preserver and freshener of the complexion, but at the present day it is a somewhat inaccessible remedy, [Not to the country girl.—ED.] A handful of bran to a basin of water has a very cleansing and softening effect, and oatmeal is equally good. As frequent a change of underclothing as possible also is a decided beautifier of the complexion, and this luxury, once indulged in, is not easily given up.

A salt bath, too, is excellent; and it is not necessary to go to the sea-shore for it, as a few cents' worth of rock-salt will supply the luxury for a month. A good-sized lump dissolved in a basin of water is all that is needed for a single application. Besides invigorating the system, this bath is said to freshen the complexion and restore the appearance of youthfulness. One certainly "feels good" after it.

Many simple purifiers, greatly in vogue two generations ago, when cosmetics were considered "sinful," have lost none of their active virtues. Among these old-fashioned remedies, a tablespoonful of sulphur, with as much molasses as is needed to mix it, taken every other morning for a week, and then, with an interval of three days, resumed again for another week, has quite a magical effect on a muddy or eruptive skin. Cream-of-tartar is also good: milk, if it does not disagree with the stomach, is a very beautifying beverage; and grape juice, pure and simple, gives the loveliest of tints, because it makes the purest blood.

A glass of hot water, as near to the boiling point as can be tolerated, taken about an hour before each meal, helps greatly to keep the complexion in order; and half a lemon may be added if desired, but no sugar. Powdered charcoal is often efficacious. A teaspoonful mixed with water should be taken three nights in succession, and then followed by citrate of magnesia to remove it from the system.

Prevention, however, is always better than cure; and a proper or improper diet is sure to tell upon the complexion.

OLD-FASHIONED HOUSES.

NOTHING adds more to the "cheeriness" of a sitting-room in winter than a sunny window full of plants and flowers. What a pity we cannot all have sunny windows. It seems to me that the old-time builders must have had an especial spite against the sun, since they managed so cleverly to shut him out of so many farm-houses. In many sitting-rooms into which he would send his rays if possible, the builder has sunk the porch into the house five or six feet, seemingly to guard against his entrance.

I once lived in one of those old-time houses where, if the architect had studied to that end, he could not have shut "Old Sol" out more completely. The house was low and rambling, with low eaves, and surrounded by trees. The only sunny room in it was the kitchen, and that was small and blazing with heat from the stove and sun together. The other living-rooms had all of their windows to the north. If there happened to be a sunny window, it would brighten a closet or pantry. Windows everywhere except in the right place! My plants had a sorry time of it in that house. There was one window in the sitting room that opened into a kind of alcove formed by the upright and wings, where the sun straggled in for a half hour each day. There I kept my poor starved plants. It was the dream of my life then to have windows cut through in every available place. Even a "sunk-in" porch would have been a treasure in that house. I should have had it inclosed with glass immediately, and transformed into a mimic conservatory.

Why will people go on living in such houses year after year, when a little deft carpenter work done here and there would make such a change, and render their rooms so cozy and bright? Aside from this, the injury done to a person's eyes while sewing or reading in those dark, old-fashioned rooms, is no small amount, as I can testify from experience. I wish the careful housekeepers that we read of, who keep the blinds closed, or the shades drawn down to keep the sun from fading their carpets, could exchange windows with some of their sun loving sisters.

Here are two of my stand-by cake recipes. They are reliable and never disappoint me.

CUSTARD LAYER CAKE.

Four eggs beaten with two cups of sugar until light, one half cup of sweet milk, two tablespoonfuls of butter, more if melted, three heaping teaspoonfuls of baking powder, two cups of flour. Flavor with lemon.

CUSTARD FOR THE ABOVE.

Take one cup of milk, one tablespoonful of corn starch dissolved in it and brought to a boiling heat, and the yelk of one egg to color it. Sweeten and flavor with lemon. Let cool and put between the cakes while they are warm.

MARBLE CAKE.

Light part: one and a half cup of white sugar, one-half cup of butter, one-half cup of sweet milk, one-half teaspoonful of soda, one teaspoonful of cream-of-tartar, whites of four eggs, two and a half cups of flour. Flavor with lemon.

Dark part: One cup of brown sugar, one-half cup of molasses, one-half cup of butter, yelks of four eggs, one-half cup of sour milk, one-half teaspoonful of soda, two and a half cups of flour, one teaspoonful each of nutmeg and cinnamon. FANNY FLETCHER.

FOR POLISHING FURNITURE.

A VERY nice screen of ebonized wood standing in a back parlor, had become defaced with white paint by having the door opened against it. Upon inquiry at a furniture store as to what could be done to restore it, I was told to rub all the spots, the way of the grain of the wood, with finely pulverized pumice-stone and oil—any furniture oil—and then polish with a soft, dry cloth. I followed directions and, to my delight, the screen looked like new. So I went through the house, and found many articles of furniture that needed attention, and which now shine resplendently.

M. A. PETERSON.

DON'T begrudge 15 or 20 minutes a day to brushing the hair. We know from experience that, if persevered in, it has a wonderfully subduing effect upon coarse, harsh hair.

BREAD FROM ROLLER PROCESS FLOUR.

MY method of making bread with compressed yeast and roller-process flour is very simple and quite different from the way of making bread of home-grown wheat, for which we found potatoes indispensable. For my family of seven persons, I use two-thirds of a cake of compressed yeast, leaving the remainder for making milk-rolls the next day.

We make bread and rolls three times a week. About eight o'clock in the evening, I prepare a pan of flour, sifting and warming it. Have ready three pints of new milk, or milk and water, if milk cannot be spared. Into this, stir the two-thirds of a cake of yeast dissolved, a teaspoonful of salt, and, having beaten it thoroughly, knead it hard and place it in a pan, covered, where it will keep warm all night. In the morning, work it into three large loaves, put into deep iron pans (well buttered) and let it rise again. Then turn each loaf out of the pan on to the molding board, and knead it lightly and rapidly, using no more flour than is required to keep it from sticking to the board. Return to the pans, have ready a little dish of melted butter and brush each loaf over with it, using a bit of soft muslin. This will prevent a hard, thick crust from forming. In 15 or 20 minutes, it will be ready for baking. Put it into a hot oven, and, if the top is in danger of scorching, cover with a thick paper or light tin cover. Do not put anything heavy upon it, for doing so will make it sodden. When done, turn out upon a clean linen cloth, and cool it before putting it in jars.

For our tea rolls which we bake between our bread makings, I use one quart of milk heated to the boiling point, and add to it one teaspoonful of salt, two dessertspoonfuls of lard, and two of granulated sugar. I let stand till it is lukewarm, then add the one-third of a cake of compressed yeast, dissolved in a little tepid water. I mix it in a soft sponge in the morning about eight o'clock, let rise and work it over, kneading it hard. I let it rise again, and turn it out on the molding board, working it lightly and rolling it out as for biscuit. I cut it with a biscuit-cutter and put a small lump of butter on top of each roll, folding over and pressing together. I now place the rolls in a deep baking tin, brush the top with butter, and let them rise once more, then bake about 20 minutes in a hot oven. When done, I have ready a little milk and sugar, to be washed over the crust. These are excellent.

MRS. C. S. SPEAR.

HOW CRANBERRIES ARE COOKED AND SERVED AT THE RURAL GROUNDS.

LOOK over carefully, rejecting the imperfect ones. Wash and drain, turn into a granite-iron-ware kettle, add water to half cover, cover tightly and cook until tender. When cool, press through a wire sieve—being careful to press every particle of pulp through—sweeten with granulated sugar, and boil slowly 15 or 20 minutes. Stir often to prevent burning. Turn into a flat dish of such size that the cranberries will be about an inch and a quarter in depth. When firm, cut into cubes and serve two or three, according to size, in small dishes. The effect is pleasing if the cubes are served in gilt-banded, white china.

VEILS of good size are now worn.

FRINGE is again coming to the fore.

CORDUROY has been fashionable goods for gowns this winter.

WE seem to have taken up the French fad of wearing flowers upon our winter bonnets.

News of the Week.

HOME NEWS.

SATURDAY, January 12, 1889.

AN epidemic of White-capism has suddenly afflicted half the States in the Union, if not more. It has spread East as far as New Jersey, where the usual threatening notices have made their appearance in several localities. Indiana and Ohio are still its headquarters, however, in spite of the efforts of the Governors of both States to suppress the lawless organizations. Everywhere the members pharisaically pretend to be better than their neighbors, and to be acting as censors of the morals of their respective communities, executing their own irresponsible sentences by visiting obnoxious parties in overwhelming numbers during the darkness of night, with their features concealed by white caps or other devices, and flogging them unmercifully. Women and cowardly men are the people whom they delight to torment. A bold resistance, even by a single person, generally puts the skulking rascals to flight. Where their identity has been disclosed, it is generally found that they are a set of rapscallions who themselves richly deserve the withes, although in some places they appear to be among the most respectable and law-abiding members of the community. Private grudge or enmity on their part, instead of moral turpitude on the part of their victims, is often the cause of their action. A number of deaths have resulted from their conduct. Moreover, just think of the misery caused by dread of their threats and the sting of their lashes! ....During the past year, lynchings have been unusually numerous in the South and West. There have been eight in North Carolina alone, and the Attorney-General of the State says that he has no doubt that many innocent persons were hanged; and that sometimes the men who were really guilty were the prime movers in the outrages, in order to fix their own guilt on others. The number hung or shot by Judge Lynch in several other States was still greater. There is no doubt that laxity in legally punishing criminals is the chief cause of these popular outbursts of lawlessness. Vastly more care is taken to protect than to punish the guilty, and the greater a man's guilt, the greater the protection the laws and especially the lawyers, afford him. The legal executions during the year in the whole Union were only 87, as compared with 79 in 1887, 83 in 1886 and 108 in 1885. Here are the numbers in the different States and Territories: Alabama, 5; Arkansas, 5; California, 5; Connecticut, 1; Delaware, 1; Georgia, 3; Illinois, 2; Indiana, 1; Iowa, 1; Kansas, 2; Kentucky, 1; Louisana, 3; Maryland, 1; Massachusetts, 1; Minnesota, 1; Mississippi, 4; Missouri, 4; New York, 9; New Jersey, 4; North Carolina, 2; Ohio, 3; Oregon, 1; Pennsylvania, 5; South Carolina, 5; Tennessee, 2; Texas, 6; Arizona, 1; Idaho, 2; Montana, 2; Washington, 1; Wyoming, 1; Indian Territory, 2. Of this number all were males but one; 57 were whites, 29 negroes and one Chinaman..... .... The Secretary of the Interior asks Congress for $350,000 to be immediately available for prosecuting the survey of the arid lands ... Proofs are fast accumulating in Minnesota Dakota and Washington Territories that a rich, well organized gang, many of them apparently of the highest respectability, are smuggling large quantities of opium from British Columbia. Large seizures of the drug have recently been made at several points in the Northwest and on the Pacific Coast, and a number of arrests have been made. It appears difficult, however, to secure convictions. ....Members of the Cotton Oil Trust monopoly are busy getting control of the manufacture of pine bagging in the South. The Trust is hesitating as to the prudence of monopolizing this new business; but its members are eagar to put millions in it, in the expectation of getting many more out of it.... ....The Frank Leslie Publishing Company, of this city, has been incorporated, with a capital of $1,000,000, and will henceforth control the great business which has, since her husband's death, been managed by Mrs. Leslie. .....The able and magnetic Rev. John Dooley, pastor of the Broome street Mission Tabernacle, this city, has resigned, to become superintendent of the Albany City Mission and Tract Society, next April.....A dispatch from Los Angeles, Cal., states that the mystery of the Murchison-Sackville correspondence is fully dispelled. The writer of the "Murchison" letter is one George F. Osgoodby, of Pomona, Cal., a New-Yorker by birth, of English parents, thirty-four years old. Murchison is a family name, attached to the Osgoodbys by marriage..... The publishers of the temperance paper the "Voice," charge that the Republican National Committee bought its mailing list and other private matter pertaining to the paper from two dishonest employés, who had stolen the matter, and who, besides cash down, received promises of fat government situations after March 4. The employés have been arrested and have confessed. Quay and Dudley are said to be implicated. The Knights of Labor also allege that some one sold to the same committee the mailing list of their organ, the "Journal of United Labor," for $5,000. The subscribers to both papers received "any amount" of Republican campaign documents through the mail. No denial yet.....The strike on the "Q" system has been declared "off," on the promise of the railroad people that they would not oppose the employment of their old striking hands either on their own roads or on others—a very small concession....Chief Arthur, of the Brotherhood of Locomotive Engineers, will, it is said, soon resign, because the present policy of the Brotherhood is not in accordance with his views. There's talk of "locking up every wheel in the country" next spring, unless the railroads make great concessions to the engineers, firemen, switchmen, etc.....The number of railroad employés now in this country is about 785,000. The 7,200 miles of road built last year gave employment to about 36 000 new hands. The average throughout the country is about five to a mile ..... A test case is to be brought in this State to try the constitutionality of the collateral inheritance tax .....Last Monday, a Mayoralty election took place at Windsor, Canada, (across the river from Detroit), at which the question of annexation to the United States was the issue, and if the annexation candidate had got 20 votes more than were polled for him, he would have been elected. The issue wouldn't have been made, however, had not the annexation sentiment been exceptionally strong there, owing doubtless to the proximity of the place to the United States, and especially to wide-awake, prosperous Michigan..... On the same day another Mayoralty election took place at Ottawa, with the National question as an issue. The English candidate was elected by 100 majority, though the French-Canadians made desperate efforts to elect their man. A bitter feeling exists and is growing between the two nationalities, and long-headed people foresee a serious conflict between the races before long .. .... While the national debt of the United States is decreasing every year, that of Canada is increasing. While the writer was traveling extensively through Canada some years ago, he was frequently told, half seriously, half jocosely, that the proper policy for the country would be to make a vast number of internal improvements in the way of railroad and canal construction, etc., even if a large debt had to be incurred to do so. Then when annexation took place. Canada would be well equipped for successful competition with the other States, and the Union would have to assume the debt of the new accession. To make the improvements beforehand at the general expense would be easy, to do so afterwards might be difficult. Has this idea anything to do with the great increase in the debts of the Dominion? ... . Frequent obstructive tactics and dead-locks in the Lower House of Congress during the week, as a few men seem determined to prevent all legislation unless they can get their own pet measures through in spite of the opposition of a large majority of the House. The Oklahoma and Pacific Railroad funding bills can hardly come up on this account, until the last six days of the session, and cannot then be passed unless the Senate will have already passed them. There are 12,000 bills now before Congress, and new ones are introduced every week to "make a record," as only a very few of those already considered can be acted upon. The Democrats want to make capital before they become the minority, and the Republicans want to delay desirable legislation till they can get the credit for it when they are in the majority and therefore the responsible party.....

As Good as Medicine.

Invalids like encouragement. The physician of kindly demeanor acts often as a remedy in himself. There is an indefinite yet delightful assurance of convalescence in every word, every gesture.

But better than this is evidence, evidence of past success, evidence of present efficiency. Such, for instance, as the following, in regard to Compound Oxygen.

FREEMANSBURG, N.Y., August 10, 1888.
"I would not have been amongst the living if it had not been for Compound Oxygen." MRS. S. RAPPLEYE.

NORWOOD, MASS., August 10, 1888.
"I have improved very much under your Treatment." MRS. USTICE STOCK.

NEWARK, N. J.. June 12, 1888.
"Mother and I are enjoying good health, no doctor having been called to our house for over three years, ever since I first sent for Compound Oxygen." MISS SUSIE STEELE.

MILTON, DEL., August 8, 1888.
"My wife says I must tell you she believes that she would have been in her grave if it had not been for Compound Oxygen."
J. B. MUSTARD, *Postmaster*.

The above evidence needs no comment. We would add, however, that we publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, January 12, 1889.

A BILL is now before the Pennsylvania legislature, which makes it a crime for any person in the State to sell or offer for sale any dressed beef, pork or mutton, unless the animal from which it was taken has been previously "inspected on the hoof," so as to make sure that it is in a healthy condition. Last year Chicago slaughtered 1,820,000 cattle for dressed and canned meat, besides vast droves of swine and sheep, and this measure is to shut out competition with the cheap dressed meats of the West. It is said to be in the interests of Eastern farmers, the prices of whose stock are kept unduly low by this dressed meat competition. Others, however, insist that it is merely the result of the machinations of Pennsylvania butchers and stock-yard monopolists, who have seen their enormous profits dwindle because so much of the meat for local markets is now supplied from Chicago. These say that farmers would be benefited hardly at all by the passage of the bill, as stock would be cheaply transported on the hoof from the West, and that the chief or only gainers would be the butchers and stock-yard men; while the public would have to pay considerably higher prices for their meat.....Byron Halstead, Professor of Horticulture at the Iowa Agricultural College, at Ames, has accepted a similar situation at the New Jersey Experiment Station, at New Brunswick .... There has been trouble between Mexican shepherds and herders belonging to the Chiricahua Cattle Company, on the Gila River, in Arizona. The shepherds were all killed for daring to graze their flocks near the company's range .....Accounts come of appalling suffering from starvation among settlers in western Walsh County, Dakota. Over 70 families, with four or five children each, have been living on porridge made by cooking their frozen green wheat and oats, stuff fit only for hogs. They went there with little money a few years ago, trusting to their crops for support after the first season. Crops mostly failed last year, and they had absolutely no money. They've had no flour for six weeks; their potatoes, which they shared as long as they lasted, are all gone, and they are on the brink of starvation. They have worn their clothes into rags; their shanties are open all over to rain, snow and blizzards, and there's little fuel. Aid will be thankfully recived by the Rev. C. W. Riches, Park River, Dakota. Send some right along—no fear of there being too much for a long, bitter winter and 70 starving, ragged families, with five thin, half-naked children apiece..... The Jute Bagging Trust is collapsing..... Owing to alleged favoritism on the part of the Pennsylvania Railroad Company, the Baltimore elevators are overstocked with wheat, and loaded cars are side-tracked as far north as York, Pa., while the Philadelphia elevators are nearly empty. While over 4,000.000 bushels of wheat are awaiting shipment in the Monument City, less than 325,000 bushels are in the Quaker City elevators..... . The prize of 80.000 francs offered by the French Government for a machine that could successfully separate the fibre of the ramie plant from the woody portion of the stem, has not been awarded to any of the ten competitors, as none had satisfactorily done what was proposed. The great strength, fine lustre and beauty of the fabrics made from the ramie, would undoubtedly place it ahead of cotton, flax and hemp were it not for the difficulty of cheaply separating the silky fibre from the resinous, woody substance with which it is incorporated. This has hitherto defied the ingenuity of mechanics and chemists. .. .. Representatives from 30 States, including all of the Eastern States, were present at the second annual meeting of the American Association of the Agricultural Colleges and Experiment Stations, held at Knoxville, Tenn., last week. Special attention was given to a dircussion of the work and organization of the new Agricultural Experiment Stations. It appears that in all the States, except two or three, the $15,000 a year given to each station are honestly expended in accordance with the letter and spirit of the Hatch law. It will be remembered that provision was made for withholding the appropriation from stations which misused it. It is to be hoped that this provision will not be permitted to fall into "nocuous desuetude."....

True Merit Appreciated.—Brown's Bronchial Troches are world-renowned as a simple yet effective remedy for Coughs and Throat Troubles. In a letter from Hon. Mrs. Pery, Castle Grey, Limerick, Ireland, they are thus referred to: "Having brought your 'BRONCHIAL TROCHES' with me when I came to reside here, I found that, after I had given them away to those I considered required them, the poor people will walk for miles to get a few." Obtain only "BROWN'S BRONCHIAL TROCHES." Sold only in boxes.—*Adv.*

Literary.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

"NOT as I wants no hard feelin's betwixt Bill an' me," explained Jim, "an' not but I thinks everything of the Parson here, but could I speak to ye outside, mum?" And he winked again in the direction of the minister.

Mrs. McKelvey threw a shawl over her shoulders, and went at once, knowing that it must indeed be something out of the usual line of events that would prevent Jim Foster from speaking out in public.

Mr. McKelvey apparently had perfect faith in his wife. He kept at his work, only stopping once to sharpen his knife on the leg of his boot. A close observer might have detected a look of sorrow on that part of his face left exposed by his beard, but let us believe that it was caused solely by the loss of the music.

Mrs. McKelvey and Jim found Ben Stone waiting for them on the outside. There are many things that tempt one to believe that Jim and Ben had been sent as a sort of committee to perform the business which they unfolded to Mrs. McKelvey.

"Now," said the landlady "you wanter talk quick fer h'I'm behind with my work."

Jim certainly consumed very little time in his introduction.

"Do ye 'spose that we can git the Parson ter fiddle fer the dance down ter Cobb's?"

Mrs. McKelvey held up her hands in holy horror. "The Parson at a dance!"

"I knowed what ye'd say at fust, but wait till I tell ye about it. Ye see we hired Hank J cobs ter come over from Carter's an' play, but the boys from camp say he's drunk an can't come. We danced a couple o' sets ter Bill Gammon's singin,' but his wind gives out too quick. I was gonter quit an' come up an have a visit with your kid, when Ben, he said that the Parson kin jerk a bow right alongside Hank. So I sed I'd come down an' see what the prospects is fer gettin the Parson. It'l be a big thing fer him. He kin git acquanted 'round, an' the boys 'll turn out big fer his preachin' termorror."

Mrs. McKelvey very weakly hesitated. She ought to have told him at once that the Parson could not go, but the thought of Jim Foster leaving a dance to visit with her baby was too much.

"But I don't believe ye kin git him ter go," she objected."

"But I've gut an' idee ter cover that pint," said the diplomatic Jim; "I'll jest tell him it's a sorter soray like. We'll introduce him 'round, and put him inter Cobb's front room, an' then call on him for a tune. Then we'll form on fer a two-by-four in the next room, an' while he's playin' jest make the dust fly. Then we'll cheer him big; an' call him out agin, an' the rest of the crowd kin dance. We've gut it all fixed up, an' ye kin help us big, mum, by tellin' him it's all straight."

This plan was certainly both bold and original. Mrs. McKelvey hardly knew what to do. She was very anxious to please Jim, and yet the idea of the Parson forming the orchestra in a ball-room, struck her as a performance not exactly prescribed by the Church of England. It was too great a question for her to decide. Let the Parson decide for himself.

"Go in, an' ask Parson," she said at last. "If you can git him to go, I won't put no veto agin it," and she turned back into the house.

"All right," said Jim gleefully. He considered the worst of the battle over. "Come Ben," he added, "les' go in an' tackle him," and he led the way into the kitchen followed by Mr. Stone.

As it may be that some of my readers may be called upon at some period of their lives to perform some delicate feat of diplomacy, I would ask them to note carefully Jim's method of approaching the minister. They may be able to obtain some very useful hints.

"Parson," said Jim, when they were fairly in the room, "this is my friend, Mr. Stone. He's go'nter come to hear ye preach termorror."

The "fool" rose to his feet to greet his parishioner. "I am glad to greet you, sir," he said as he walked over to shake hands with our friend Ben. This action roused Ben to a realization of the fact that he was the "Mr. Stone" referred to. He had been called "Ben" so long that the new combination sounded strange to him. Thinking his part of the conspiracy demanded some return for the minister's greeting, he shook the extended hand till the Parson winced. "How be ye, Parson," he said in his pleasantest voice—"how's tricks?"

"I am well, I thank you," replied the little minister, examining his hand to see if any of the bones remained. Tricks were evidently somewhat dull.

"Wall, that's bizness, health is wealth an' wealth is health.' I'm healthy an' yet I ain't wealthy," with which startling truism, Mr. Stone seemed to reach the limit of his conversational powers. He gave Jim an intimation of the fact by sitting down near Mr. McKelvey.

(TO BE CONTINUED.)

CATALOGUES, ETC., RECEIVED.

STUDENT LABOR.—This is the topic mainly discussed in the report of the Farm Department, recently issued by Prof. Johnson of the Michigan Agricultural College. Prof. Johnson has some very positive ideas regarding this subject, and, as the labor system has done much to sustain the Michigan college, those interested in the subject will want to read this article.

STEEL CASE HAY BALING PRESS.—Catalogue from P. K. Dederick & Co., Albany, N. Y. This is a very valuable machine, and it will pay all hay-men to investigate it. It possesses every advantage possessed by the wood-framed machines; with the added advantages of superior strength, solidity and permanency. Indeed, this press might well be called "everlasting," for it will surely outlive any common machine. Send for this catalogue and see what the press is.

CLYDESDALE AND ENGLISH SHIRE HORSES.—Catalogue from Messrs. Galbraith Bros., Janesville, Wis. This is an elegant volume—one of the most complete stock catalogues issued in this country. The fact is very evident to observing stock-men, that the business of producing good draft horses has of late been surprisingly popular. The following conclusions, taken from this catalogue, seem to us sound.

"There has never been, at any previous time in the history of this great country, such a uniformly strong, healthy sentiment in favor of draft horses as there is now, nor so large a margin of profit between the cost of them and the selling market value. Notwithstanding the fears and warnings of those pessimistic wiseacres who have been predicting the collapse of the draft horse business annually for the last half-dozen years, the demand never was stronger nor the prospects brighter than they are now."

The purpose of this catalogue is to advertise the superior points claimed for the British Shire horses, and the reader must admit that the arguments are shrewdly and forcibly put.

THE KNABE PIANO.—Catalogues from Knabe & Co., Baltimore, Md. It seems useless to attempt to praise this instrument when hundreds of our best musicians are constantly testifying to its excellence, by keeping it in use. It possesses merits that have given it a remarkable sale and a place in the very front rank of musical instruments.

FELT SHOES AND SLIPPERS.—Circulars from Daniel Green, 122 East 13th Street, New York. These articles are invaluable to those who suffer from cold feet. They are easy, comfortable, warm and durable. The good husband may well remember his wife with a pair of these slippers.

THE OLIVE, ITS CULTURE IN THEORY AND PRACTICE.—By Arthur Tappan Marvin, sent by the Orange Judd Co., New York, price $2. This is a complete and very interesting account of the cultivation of the olive and the harvesting and preparation of the crop. The author presents his own experience, coupled with a general compendium of all previous literature bearing on the subject. Californians who wish to develop the olive industry in their State, will find this book very instructive.

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

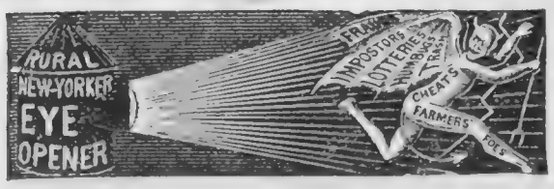
From Josepn Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined."

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

The Rural New-Yorker,
34 Park Row, N. Y.



THE "ELECTRIC SUGAR" SWINDLE.

The worst "blind pool" swindle ever perpetrated has just collapsed. It is known as the Electric Sugar Refining Company, and it has an office in this city, a "refinery" in Brooklyn, and a branch in Liverpool, England. In 1881-2 "Professor" Henry C. Friend, then about 40 years old, called upon several large sugar refiners in Chicago and New York, and tried to induce them to invest capital in a secret process, which he said he had discovered, for refining sugar by means of electricity at a nominal cost. He wanted them to get up a company with a large capital, which should pay him an immense sum for his "secret," which he insisted must remain in possession of himself and wife. All refused to invest money in such a "blind pool," though they were ready to invest any amount in the enterprise if, on investigation, the professor's claims proved to be well founded. The latter was persistent, however, and shortly afterwards managed to get up, in Chicago, a company with a small capital; but as he still refused to disclose his "secret," the "business" was not prosperous, money soon ceased to come in, and the concern collapsed, the investers losing every cent. Shortly afterward, in 1884, Friend came to this city, and at last succeeded in starting the Electric Sugar Refining Company, with a capital of $1,000,000, in 10,000 shares of $100 each. Several well known business men became interested in it, and soon the business was "booming." Why sensible men could be foolish enough to put money in such a scheme can be accounted for only on the ground that, like ordinary gudgeons, they could not resist the alluring promises of enormous profits. Friend and his wife had everything in their own hands. They were to remain in possession of the secret, and any attempt on the part of the company, their employes, agents, or lawyers to find out the secret, forfeited all their rights and any stock they may have held. It was also a condition that the request of the stockholders for the secret or any attempt to force it by legal process, should work a forfeiture, and, in case the professor died, the conditions should remain the same with regard to Mrs. Friend.

Of the 10,000 shares, 5,250 were owned by Friend, giving him a controlling interest; 2,793 were sold to 650 persons in England; 1,000, were given gratis to President Cotterell and Treasurer Robertson, and the remaining 957 were sold to people in this country, many of whom bought them for speculation. According to the general opinion, about $350,000 were paid into the Treasury as the proceeds of the sale of the shares. Of this amount, nearly $200,000 were advanced to Friend for the purchase of machinery; while about $45,000 were given him to be expended on the Brooklyn refinery, a ramshackle old building leased on condition that on the expiration of the lease, all the fixtures etc., should revert to the landlord. One of our city papers, however, prints a table to show that $928,000 were received for the shares sold, instead of the $350,000 admitted. It says all expenses were not over $170,000, so that $748,000 are still unaccounted for. Here and in England, the prices of the $100 shares ranged from $200 to $585, and it appears nobody really knows how many were issued, except, of course, the inside circle of conspirators. Friend died last March of a gallon-a-day-of-brandy, and was buried on Blizzard Day, and since then his smart, resolute widow, who has bought a fine house and farm at Milan, near Ann Arbor, Michigan, has been the sole possessor of the "secret." There is a dispute as to what this pretended to be. The officers of the company, in conversation and by circulars, stated that the process refined raw sugar direct from the cane to a higher standard than could be obtained by any other means; but no such claim is contained in the original contract, which merely says that it is a process for refining different grades of sugar at prices far below the market value thereof, making 90 per cent of pure sugar, with a loss of weight of not over five per cent.

From the first, Friend permitted no one, except his wife, to see the process in operation. When the refinery was started in Brooklyn, two rooms were partitioned off and lined with sheet-iron. When exhibitions of the process were made, all could see barrels of coarse sugar carted to the building; they were rolled into these rooms, which contained all the "machinery," chemicals, etc., and finely ground sugar of a superlative quality soon poured down through the chutes, into the bins in the room below, where the spectators were assembled. After Friend's death, his brother-in-law, Howard, did the work. A few days after New Year's, a cablegram from England announced that shares there had suddenly fallen from £80 to £1. Here there was at once a corresponding tumble. For some time previously the stock had been going down somewhat, but this instantaneous collapse was a thunder-bolt from a cloudless sky. The company wanted to begin a regular business, and asked Mrs. Friend to disclose the secret of the process She absolutely refused. Doubts as to the genuineness of the thing soon became certainties that it was a fraud. The secret rooms in the Brooklyn refinery were, after much trouble, broken open, and were found to contain some barrels of coarse, brown sugar, some of fine, white sugar caked in masses, a sugar grinding mill, and a few other things of no importance. The thing had been a gross fraud on the public from the beginning. The brown sugar, instead of being instantly refined, and poured down through the chutes as pretended, was set aside and the prepared white sugar was ground and sent down in streams to dazzle the admiring spectators. Only a small fraction of the $200,000 given Friend to buy machinery could have been spent for the few paltry appliances on hand, and only a small part of the $45,000 be claimed to have expended on the building, could have been laid out on it. Investigation shows that the affair was a swindle through and through. Neither the President nor the Secretary had invested a dollar in it. The previous President had been discharged because he had dishonestly pocketed the proceeds of 561 shares; but he wasn't prosecuted lest the disclosure should injure the credit of the concern. Everybody officially connected with it appears to have been "on the make." The outside stockholders on both sides of the water were gulled on all sides. Shares can now be had for $10 here, and for $5 in England. They are thought to be worth this for the chance of something turning up

There is a good deal of loose talk about criminally persecuting Mrs. Friend and her confederates; but it appears that there is little legal ground for such a course. The officers of the company, against some of whom grave charges of an ancient date are raked up, seem to have willfully deceived the public as to the claims made for the "invention" in the contract between the company and the inventor. The public, dazzled by the enormous profits promised by the company, blindly invested their money, and, as ought to have been expected under all the circumstances, have been beautifully swindled. There may be a process for improving refined sugar, as the samples produced are said to have been of a finer grade than can be made by any known process; but, if so, Mrs. Friend holds the secret, and resolutely refuses to disclose it. She also maintains that she holds the secret of a process, invented by her husband, for making ordinary refined sugar out of grape sugar. To this, she says, the company has no claim whatever.

What is the lesson taught to the public by the "electric sugar" gang? Simply that it is the sheerest folly to invest either faith or money in a business with which one is unacquainted, and whose workings are entirely in the control of other parties. There are many such blind pools, in mines, stocks, produce, etc., and farmers have lost thousands and thousands of dollars by them. To the lessons taught by these should be added that inculcated by the "Electric Sugar Swindle."

Trees, Seeds and Plants.

TREES ROSES GRAPES

We offer the largest and most complete general stock in the U. S., of **Fruit & Ornamental Trees, Shrubs, Evergreens, Roses, Pæonies, Hardy Plants, Grape Vines, Small Fruits,** etc., including many **Novelties.** Catalogues giving information indispensable to planters, sent to all regular customers **Free**; to others: No. 1, Fruits, 10c.; No. 2, Ornamental Trees, &c., illustrated, 15c.; No. 3, Strawberries, No. 4, Wholesale, No. 5, Roses, *Free.*

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII NO. 2035. NEW YORK, JANUARY 26, 1889. PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered According to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

The Herdsman.

PROFIT IN ANGORA GOATS.

HENRY STEWART.

THERE are some mistaken ideas current in regard to goats. It is generally supposed that these animals are exceedingly hardy and easily kept; that they subsist upon brush and coarse herbage that is not good for any other use; that they are not injured by dogs, and need no looking after except at shearing time; in short, that "they are all that fancy painted" in regard to an easy way of making money. All these suppositions are baseless. A goat is very much like a sheep, except that it is more enterprising, restless and erratic, and it needs quite as good food and care to be a source of profit. The only places and circumstances in which I know of goats being kept profitably, with little trouble and expense, are the islands of the Pacific coast where the modern Robinson Crusoes live surrounded by their flocks and the ocean, which makes the only fence that can restrain these "birds of freedom"—as one might very well call them from their flighty habits and high roosting proclivities. I have known them to get upon the roof of a barn-shed and bask in the sun, and at night to choose the same gently sloping roof for their sleeping place. Perhaps this was to escape the prowling dogs, which are as apt to make mutton of them as sheep. Goats are quite as easily destroyed by dogs as sheep are, although they are better able to escape from attack by their superior agility. They are equally subject to the diseases of sheep as these are. Scab, foot-rot, liver-rot, and the ordinary troubles which affect neglected sheep, attack goats, and these animals require quite as much care at all times as sheep do, so that the charge of a flock of goats is no sinecure, unless one could have a moderate sized island for his pasture, where he could be "monarch of all he surveyed" with none his "right to dispute." But the sea should be broad enough to prevent errant dogs from swimming over in pursuit of their favorite sport.

But, as to profit, there is profit in any industry if it is only properly pursued. The fleece of the Angora goat is a valuable staple used in American factories for the making of braids, fringes, and lustrous goods which are generally known as mohair, and the wool generally brings more than the fleeces of the long-wool sheep. Sixty cents a pound is about the average price, and a good fleece will weigh eight pounds. Goat's flesh is as good as mutton, and the kid makes excellent lamb. I have seen and eaten lamb which had hairy legs, but, keeping my own counsel, no one else had any suspicion that it was not choice South Down. Nevertheless, goat mutton and kid lamb are not free from a certain natural prejudice dating back to primitive times when the goat was supposed to be a wicked animal, and most suitable to bear vicariously the sins of a whole nation, besides being made the type of the unregenerate and vicious lost souls. Strangely enough, this bad name still sticks to this useful race, and it is undoubtedly a bar to the fully profitable keeping of these really innocent and valuable animals.

Goats may be made profitable for cheese-making. The famed Roquefort cheese is in part made of goats' milk. There is a certain demand for them, for milking, by residents of suburban localities, and for the so-called all-purpose "dairy animal;" it is certainly much in their favor that they yield a comparatively large quantity of rich and sweet milk, a valuable fleece, and, quite possibly, two pairs of kids in the year, and at the end they make good mutton. No general-purpose cow (if she is ever found) can do all this. Goat skins, too, bear a high price and are in demand for the manufacture of morocco and kid leather, also for glove leather. In fact, the goat has more valuable uses than any other domestic animal, and if a flock is well cared for, can be kept in due restraint, saved from dogs, and, provided with any kind of nutritious pasture—the better the more desirable—it would be more profitable than sheep, were it not for the prejudice against the use of its flesh for mutton. An excellent illustration of a pair of Angoras will be found at Fig. 13.

[As is the case with many other products, fashion has much to do with the price of mohair. We are informed by dealers here that the current price now paid is not more than half that now given by Mr. Stewart.—EDS.]

A PAIR OF ANGORA GOATS. Fig. 13.

The Vineyard.

THE "GENEVA" GRAPE.

(*See page* 50.)

A SPECIMEN of this vine was sent to the Rural Grounds (No. 300) in April of 1886. Somewhat crowded by the Lady upon the same trellis, it has not as yet fruited. On Sept. 23 we received a few bunches from R. G. Chase & Co., of Geneva, N. Y., a photographic illustration of one of which we present at Fig. 14, showing an average-sized bunch. The berries are of medium size, translucent, and of a pea-green color. The skin is quite firm, the pulp tender, and the seeds separate freely. The grape is juicy, sprightly, pure and pleasant. The seeds are medium as to size and number. The vine is said to be vigorous and healthy, ripening its fruit with the Concord. The Geneva is one of Jacob Moore's seedlings from the wild Labrusca, crossed with Muscat of Alexandria, the product being crossed with Iona. Its hardiness and adaptability to various sections can be ascertained only by trial.

Horticultural.

THE WEEPING EUROPEAN ASH.

(*See page* 51.)

WE now record our experience with this tree for the first time. A single specimen was purchased 14 or 15 years ago. The stock was about six feet high, on which the pendulous variety was grafted. Its way of growing might be called lawless. One branch will grow directly downward; another directly upward, while others will shoot out in all intermediate directions. If we desire to cultivate the drooping habit, all of the rambling shoots must be cut back. The tree then in a few years becomes a rounded mass of branches and foliage, as shown in our photographic illustration Fig. 15. This picturesque tree is now about 18 feet high, with a spread of branches at the ground 25 feet in diameter. The trunk is nininches in diameter, the first branches issuing therefrom being

about eight feet high. The branches and foliage form, within, an oval arbor in which a dozen persons may socially gather and enjoy its shade. This tree needs constant pruning to preserve a symmetrical shape and also to remove the branches killed every year by the borer, which has penetrated nearly every part of it. Fig. 16 is a photographic illustration of the same tree, taken in early spring.

On the whole, we don't prize this tree very highly. Its roots extend to a considerable distance in every direction, growing near the surface and often extending above it. Again, the leaves are so late in starting that one might reasonably suppose the tree quite dead, as he sees the leaves of other trees about it well advanced.

HELP!

ON THE FARM; IN THE HOUSE.

THE QUESTION OF FARM LABOR.

A Most Important Discussion

OPINIONS FROM ALL SECTIONS.

QUESTIONS.

1. *Where do most of the farm laborers in your section come from? What nationality? What proportion are American-born, and how many of them lay up money and finally farm on their own account?*

2. *When and how are they secured? What wages are paid? Are regular contracts signed?*

3. *What arrangements are made about doing chores and Sunday work?*

4. *On the whole, what treatment is fairest for the hired men met with in your section?*

5. *Which is the better business—to hire a cheap man and try to save wages, or to get as good a man as can be secured and pay him his price?*

6. *Has the experiment of trying to break city boys into farm work ever been tried in your country? If so, with what result?*

FROM T. B. TERRY.

MOST of the farm laborers in this section are either Americans or Germans. Some of the best of them are saving money to get into business for themselves; but it would be difficult to tell what proportion. We have had two, within 20 years, who staid with us four or five years, and saved their wages carefully, and were men with the elements of success in them. They were both German. One had nearly $1,000, when he left us. All others that I now think of were of the class that live as they go, or spend as they make.

Our help here is generally hired in March, for the season (eight months) or a year; mostly for the former time. At that time there are generally plenty of them looking for places. From $15 to $20 a month were paid for the season last year. It is a good plan for one who hires by the year, to hire in the fall, and then he has many to pick from and can know the reputation of his men. I generally engage one at this time for the next season, when we are in need of a new one. If one keeps a little watch through the summer he can know where there is a good one. A neighbor hired a young German who came along one spring. In riding by I could not help noticing that his plowing was perfect, and that he worked as though he was interested in accomplishing something. When my neighbor was through with him, I hired him, and kept him season after season. I paid him $27 a month for the season of 1887, and told him he should have more in '88; but he was taken sick and died in June. It was like parting with one of the family. Men who work out should learn something from the above. The faithful man will soon be known; but farmers do not always pay such men as they should, and thus encourage them.

I never knew a contract between hired men and employer to be written out and signed. It is thought to be one-sided. The man can hold you; but if he has his money you can not hold him. If you hold something back, it would make him feel as though he was not trusted, which I do not believe is the best plan. Our hired men as a rule are as honorable as their employers. Treat them like men, and there will very rarely be any trouble. This is a dairy section, and men are expected to and do milk and do necessary chores on Sunday. They can find no fault, for they know before hiring what will be expected and what is the common custom.

"On the whole, what treatment is fairest for the hired men met in your section?" One should tell them, to start with, that he expects them to be as gentlemanly as he and his sons are; then each should be taken right in as one of the family. They should not be made to sit in the kitchen, or be otherwise treated as though belonging to an inferior race. They should be paid well and promptly, and encouraged and aided in saving their money and investing it safely. They should not, as a rule, be required to work more than ten hours a day. They should understand that you expect a day's work done; and that when it is done they can stop.

They should be encouraged to wash and slick up a little, after their day's work is done. A bath tub with water handy should be found in every farmer's home, and the hired man should be made to feel free to use it every night during the heated term. He will do more work the next day. Then he should be furnished with papers and books to read, according to his education, the same as the rest of the family.

There is in this town a farm hand whose employer has several times told me that he was a number one hand, and he thought everything of him. The farmer works his men a good deal more than ten hours a day.

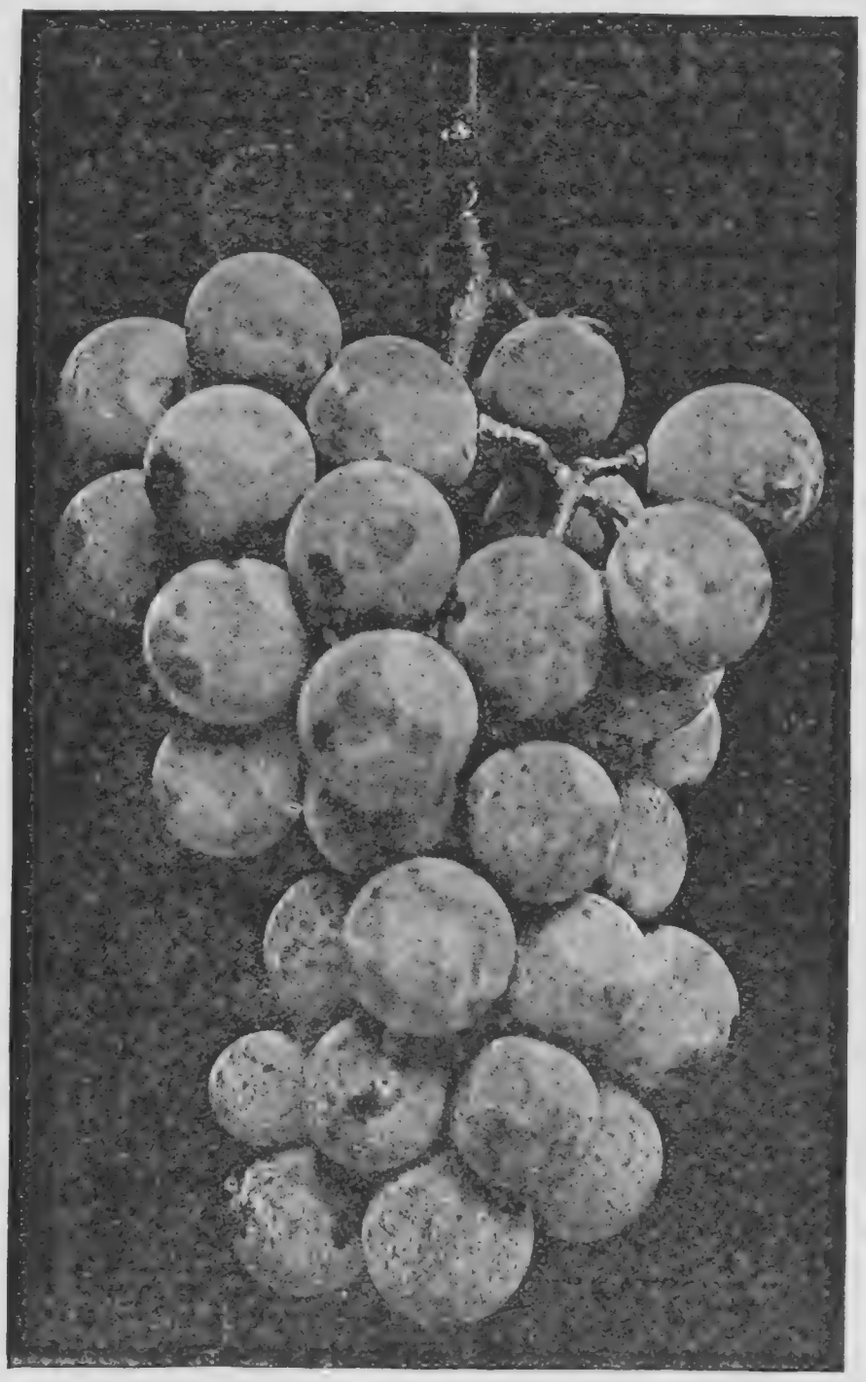
The other day this valued farm hand told me (of course not expecting it to be repeated) that when he worked in a place where he knew he must keep on the go for 15 hours or so a day, he worked accordingly; that if he knew he could stop at the end of ten hours, as a rule, he would much sooner do the same amount of work in the fewer hours; but that no man could drive him to his utmost in speed and hours both; if he was cheated on the time he would be even with his employer on the amount accomplished.

The writer became satisfied not only of the truth but of the justice of the above years ago, and his men know they are to quit at six o'clock. I couldn't be induced to go back to the old way. Where men complain because they cannot get as good help as they used to, whose fault is it? There are plenty of good men; but the best go to the city and get better wages and fewer hours to work. The remedy seems plain; make the work and home life more pleasant and pay them better.

Where one works right along with his man, all the time, it may sometimes be best to hire a cheap hand and save on the wages. The saving will depend somewhat on the reason why he is cheap. I have known boys of 16 or 18 who did not expect full wages, that I could get along with nicely if right with them most of the time. They were strong and willing, but not experienced. In this way $50 might be saved in a season's wages. Fifteen years ago I might have taken the boy; but now give me, every time, the very best man (from 20 years old to 25 preferred) that can be found, who will go ahead and take the blunt of the work and expect me to take the lighter jobs, as I have to do the thinking and planning. Then I would always pay a man his price, or not hire him. I would give him no possible excuse for not doing his best. It is the right thing to do, and then it pays him and you too. If one is small with his employés he shouldn't expect them to be angels. Hired men are very human as well as the rest of us. Of course, the "golden rule" won't always work; but it is the best rule we have to go by, and when one fails with it, after having done his share, his own conscience is unsoiled.

City boys now and then come out here and get a place. I have tried them. If they want to come I would as soon have one as a country boy of the same age and size, except that the country boy would have a little more farm knowledge to start with. It is more important what the boy is and what he likes than where he came from. I have known for 46 years, one boy who was raised in town and city, but had a love for farming. He found his way on to a farm some 20 years ago, as green at the business as any boy could be, and he couldn't be hired to go back. Yes, there are city boys who will make good farmers, just as there are country boys who cannot be kept on the farm. Most of the farm hands in this vicinity are unmarried men. There seems but one way to do—we must take them into our home. Selfishly, I should prefer not to; but as it seems to be a necessity, let us do the right thing by them, and treat them as brothers or sons while they stay with us.

Summit Co., Ohio.



THE GENEVA GRAPE. From Nature. Fig. 14.

FROM T. H. HOSKINS, OF VERMONT.

Our hired men are mostly sons of neighboring farmers; but many come from the closely adjoining province of Quebec. Many of the latter are French; but I prefer the sons of the English or Scotch settlers in the Eastern townships. Many of the French are good hands, and the only objection to them is the inability to exchange ideas clearly. They usually lay up money. Several of my young American hired men have done so to acquire an education, and have gone through colleges, literary and agricultural. The Canadians think less of this, and save to get farms for themselves. I have had two men working for me, this year, who are paying off debts on their farms which are let on shares while they do this.

The men apply personally. It is known that I pay well and promptly, and I get the pick of help. I have usually paid about $25 a month for eight months, with board. Hands who have families and board themselves get about $35; or by the day, $1.25.

It is understood that all necessary chores shall be done at all times; but otherwise all legal holidays are allowed. One of my men took the first prize in a public running match, last Independence Day; but couldn't hold the greased pig.

The above is satisfactory, as to wages. We have large lumber mills close by, which pay about the same prices for unskilled labor; but the best hands prefer farm work, going into the woods in winter. Some farm help is kept the year round, but most of our farmers let their men go on December 1, or earlier.

There is no such thing as a cheap man. You must either pay full wages for a capable man, or hire an incapable man at a serious loss. Generally speaking, these "cheap" hands are worth considerably less than nothing. They do not often ask me for a job. I no not want city help! Of all—well, condemnable help, the city-bred boy or man is the worst of all nuisances on the farm. Such people know all games to "beat" their employers, and practice them to the full limit of their hope for his endurance. Their example is demoralizing to every one that comes in contact with them, even so corrupting their employers as to make them desire to commit murder several times a day. I had one, once, —a waif from the London market gardens. He knew his work—London fashion,—but would not learn any American ways, or obey any instructions different from his own Henglish notions. I hired him for the season, and paid him for it, but let him go, gladly, before summer was over. As for the city boy, he is only just a little worse than the city man, and our village boys, whom we sometimes hire, are more plague than profit. Doubtless something might be made of this class of help in the cultivation of land, but only under military or reformatory discipline.

On the general question of farm help, I believe in paying good wages to good men; but under present conditions it is hard on the plain common farmer, far from his market, and in competition with others elsewhere with more capital and skill, and better railroad rates and facilities. The small farmer is under the harrow in New England, and flies westward, only to find it rather worse there than here. What is needed is, first, more knowledge of our business. Next, we want more capital to do it with to advantage, either our own, or hirable at a low rate of interest. Then we want the railroads to help us, by putting us directly in connection with the consumers of the large towns and cities. Few of us grow enough to fill a car at a time, and in less quantities the freights and commissions take all the profit. Most of our small northern New England farmers have relatives and friends in the manufacturing places, and could supply them with the produce they consume, if there was such a thing as a "freight express" that would carry the goods to them at a rate that would not take all the possible profit. If such a course of trade could be established, a great improvement would soon be seen in our farming; our farmers would brighten up and enlarge their operations, and the people in the towns would be better and more cheaply supplied For lack of this many are eloping to the West; and the rest, who stay at home, hardly know how to make anything at the present cost of labor and price of products. The clearest solution to my eyes is higher farming and much larger and better crops, enabling the farmer to ship direct by the carload. This, however, is difficult from lack of knowledge, capital and faith; and so our agriculture languishes as a

business; although as a mere means of getting a living it is probably no worse, but rather better than the farming of 40 years ago. But the living of 40 years ago would be comparative poverty now, and in fact it would be in many ways, impracticable to the farmer of to-day. FROM ILLINOIS.

There is no fixed rule in regard to farm laborers in this section. Frequently there are considerable variations in adjacent counties. Here most of the farm laborers are American-born with many Germans and a considerable number of other nationalities. Unfortunately very many save little of their earnings; too many of them are almost necessarily idle during the winter. A fair number, I am glad to say, do save money and become tenant farmers here or land-owners in the West.

Perhaps one in three of the hired laborers is engaged "by the year." Most of the others, aside from extra help for harvest, are engaged about March 1st, to work until "after harvest" or after "corn-husking." From $16 to $18 per month with board and washing are common wages. When there are small tenant houses occupied by married men, the money wages are frequently $25 per month. When the laborer is in any sense a foreman, or is employed for special work, the wages may be more. Written contracts are the exception rather than the rule.

The regular laborers are expected to do or help do the "chores," and the necessary work on Sunday. My own recent experience and most frequent observation are affected by closeness to towns of abont 10,000 inhabitants, furnishing a large supply of laborers, especially for "day work." On the University farms our custom has been to employ two men with families, furnishing them houses, gardens, milk, etc., expecting them to be responsible for feeding stock, and other "chores." Usually they have given board to other laborers. We have paid $28 per month. Contrary to the usual custom here, we require but 10 hours' field work a day; in winter it is less in practice. Our men are paid in full each month.

Generally speaking, a fairly intelligent, energetic man can do better than to remain a farm laborer long. Two or three years are as long as we have usually kept the better class of men. Some who have worked for us are now doing well as farmers, or in other business. Some of the best laborers we have had, have been young fellows of 18 or 20.

When there can be direct and close supervision, I believe that best pecuniary results will come from insisting on following out explicit instructions closely, rather than in leaving anything to the judgment of the laborer. I prefer having men of some intelligence, interested in their work, and encouraging them to use their own judgment concerning details, but in practice there are some objections to this plan. Where there is but one hired laborer, payment of an extra price to a proved good man is wise. Where there are several nominally under like conditions, there are obvious objections to differences in the rate of payment. Usually in such a case I would think it better to get rid of the less desirable men than to pay them a less rate.

We have had some rather satisfactory experience with young men or boys with no previous knowledge of farming, or even with our language, but this is exceptional.

So long as there is a good prospect that a good man can do better in some other way than by working as a farm laborer—and I hope this may long continue to be the case—we cannot expect long-continued service of intelligent men free to choose the place and kind of labor. So long as there remains so great a disproportion in the quantity of labor required on the average farm in summer and winter, farm laborers, as a class, will be at a disadvantage. In so far as it is practicable, it seems to me in every way desirable to try to furnish work throughout the year to desirable men, rather than compel them to be idle and an expense during the winter, or, at the best, to seek employment elsewhere.

University of Illinois. G. E. MORROW.

CENTRAL NEW YORK.

In regard to farm help hereabouts, they are mostly Germans or Irish. I could not say how large a proportion are American-born. Some lay up money; many spend all as they go. Usually a man comes along and is hired. Wages vary from $10 per month and board to $18, or $20, the amount depending on the time of the year and the length of service. Written contracts are not common. All are required to help or do the chores on the Sabbath. All are well treated, as a general rule. Some men at cheap wages, are better than more expensive ones; first-class men are cheaper at good wages than poor men at any price, but such men are the exceptions, not the rule.

I have tried the city boy, but the trial has always resulted in a failure. There is a decided dearth of good farm help. It isn't that the men are unable to do the work, but they won't. I am now in want of a good farm hand, to whom good wages would be paid, and a permanent place is offered, but a man with a pipe in his mouth won't answer. In regard to the city boy, a lad of 14 from a village came to my farm in 1887 for his vacation outing. He soon learned to harness a horse and rake and ted hay as well as a man, also to load hay. When he left he said: "As soon as school is out next June, I shall start for Rome for two months' work on the farm." He came this year and was valuable, helping in the hay and harvest fields, tedding, raking, loading hay and grain, and also mowing away the same, better than some men. A lad of 10 years came with him the past year; both were willing workers and helped in the hay field, thus showing what some boys can do, if they try. J. TALCOTT.

Oneida Co

WEEPING EUROPEAN ASH. Summer View. From Nature. Fig. 15.

spend all they earn. Most of the white laborers are satisfied if they can rent a farm. Rarely does one buy a place. The renter will make more money than he would if he owned the land. We can generally hire all we need at our doors. They come to us to hire by the year. We pay for a foreman $12 to $15, and to ordinary farm hands $10 a month, and furnish a house and garden, and allow them to keep some poultry and a pig and give them 300 to 400 pounds of pork, 12 to 13 bushels of corn and five to 10 bushels of wheat per year. Variations in the quantity of these mark the difference in wages of the foreman and ordinary farm hands.

Contracts are definite but verbal. One man is paid a dollar a month extra for doing milking and chores. All take turns in doing Sunday work.

The above is the treatment *all* receive. I never heard of a hired man here failing to get all he bargained for or being turned off without good reason. The men occasionally leave in the middle of the year to the damage of the employer, but the latter has no redress even under a written contract, as the law secures to the laborer a good deal more property than he is ever likely to own.

Theoretically, there is no doubt that it pays me better to hire a man at $15 a month who can earn $15 than to hire one at $15 who can earn only $10. Practically, inequality of wages is inadmissible; the laborer himself will not allow it. Here, as elsewhere, the lazy and noisy ones rule the quiet and industrious, and will not allow them to do more than an ordinary day's work. Nine times out of ten the laborer is demoralized by giving him more than the usual wages. The tenth man who can earn better wages and has moral force to earn them in spite of social influence, will not remain a farm laborer. He will soon either rent or own a place.

I know of no one here who has ever tried city boys. Elsewhere I have heard that city boys taken from the class of mechanics and small shop-keepers have proved the best of workers. I think, on the whole, we have the best system of hiring farm labor, viz: hire your men by the year and give them a home. Let the young men board at home till they get married.

The crying evil of the times here is "the servant-girl question." The supply of good girls is utterly inadequate to our needs. In this the city ought to help us, but it does not.

Easton. C. F. EASTMAN.

FROM WESTERN NEW YORK.

During a life-time of nearly 60 years on the farm on which I now reside, "the hired man" question has been regularly discussed as the season approaches for each year's farm work. According to my earliest recollection, those employed on our farm were young men of Puritan or New England stock, sons of the neigboring families and they were well skilled in all the requirements of the farm work

WEEPING EUROPEAN ASH. From Nature. Spring View. Fig. 16.

FROM MARYLAND.

Most of the farm laborers of this section were born here. Three-fourths are blacks and one-fourth native whites. The negroes hunger and thirst to own a house and piece of land, and where it is possible for them to purchase, they do so at any sacrifice. Without some direct motive for saving money, they of those days. As a rule, they were intelligent, industrious, of temperate and regular habits, and are to this day pleasurably referred to by the oldest farmers as models for hired men of the period. As time passed on, help of this kind gradually gave place to those of foreign birth, and the help of this locality for a time con-

sisted largely of Welshmen, who came in large numbers to this country about 45 years ago, and settled near Utica, Oneida Co., N. Y., and were subsequently employed on many of the farms of Western New York. They were, as a rule, sober and industrious, and many of them were enabled by their habits of economy to secure homes of their own and a competency for life. The above would truthfully apply to their English brethren who were also employed at that time to a considerable extent on the farms of this county. But this class of farm laborers has long since disappeared, and the German element is now and for nearly 30 years past has been the predominating help on our farms. Those now employed are mainly from the adjoining counties of Erie and Wyoming, appearing each year usually during March, visiting the different farms to hire for the season a period of about seven months, or until the regular farm work is completed; in either case the season's work is considered to begin the first day of April.

The wages paid range from $15 to $22 per month, according to the age and efficiency of the applicant. But it is considered good policy and money well expended to pay two or three dollars more per month to an experienced and reliable man, one who is fully competent to successfully manage and care for the various implements now used on the farm, who is conscientious in his work, with principles of right and justice firmly established, and a suitable companion for our sons while engaged in the farm work But it is lamentable to add that comparatively few of those employed for farm work are overburdened with the above virtues, or by their conduct illustrate them the season through. When two or more hands are employed, it is often good economy to have one of them younger and with less experience than the other, as there are many things he could do as well perhaps as could a more expensive hand.

Breakfast is served on most farms at 6 A. M. Previous to this, the cows have been milked, the horses groomed and harnessed, and other necessary chores cared for. About an hour and a half are taken for dinner, and, contrary to the old time custom of serving supper at 5 P. M., and then resuming field work until the time for night chores—the work for the day being finished at sundown, or nearly so—the work for the day now, on nearly all farms, ends at 6 P. M. Supper is eaten and chores are cared for afterward, often affording the men nearly an hour's recreation before sunset.

The above applies to those who board, lodge, and have their washing done in the farmer's family.

Many farmers have comfortable and convenient houses expressly for those men who have families, who furnish their own board and lodging. They are hired for a stipulated amount for the season of seven months, or by the year, including certain privileges, comprising house rent, use of garden, keep for a cow and fuel (fire wood) for one year's time. While the outlay for help of this kind is not materially lower than that for other men, it is generally admitted that owing to their possessing a greater knowledge of farm work, and to the fact that their "wild oats" have already been sown, they are, as a rule, more trustworthy and valuable. This, taken in connection with the fact that the labor and annoyance for the housewife are materially less, is sufficient to recommend this mode of hiring hands wherever circumstances favor its adoption. Sunday work, consisting of the chores usually done on week days, is considered obligatory, on the part of the farm hands.

Argeements relating to time, wages, chores and other minor matters on the farm, are almost universally verbal. Indeed written contracts are the exceptions, and however much we have at times realized the importance of adopting this method, I have never had a formal contract drawn up and signed, nor do I know of any of my neighbors who has done so. It is needless to add, however, that the adoption of this just and business-like manner of hiring help would tend much to lessen the unpleasantness and dissatisfaction afterwards arising from misunderstanding or failure to fulfill the conditions of an agreement.

It rarely occurs that help from the cities is employed on the farms. A common prejudice seems to exist against employing people of this character, owing, mainly, to the fact, no doubt, that the applicants are inexperienced, and, as a rule their general appearance indicates their unfitness for active farm work. Occasionally, however, there are notable exceptions. I have now in my employ a young man nearly 17 years of age who recently came from New York City, who by diligence, good behavior, and the desire manifested to comply with all reasonable demands, is fairly in the way of making himself indispensable to those by whom he is employed. In the same way comfortable homes and a fair competency can be secured to those manifesting the same spirit, who are now struggling for a bare existence in our large towns and cities.

Genesee Co. IRVING D. COOK.

FROM MICHIGAN.

By far the larger number of our farm laborers are the sons of small farmers in the vicinity, and are mostly American-born, though frequently of foreign descent, mainly German or Dutch. Probably 50 per cent of them save money, and eventually buy or rent farms for themselves. Those who rent are naturally increasing in number as the country grows older, the number who buy correspondingly decreasing. What might be called the professional laborer is only beginning to be a factor in the community. Men of this class are mostly limited to those who are married and day laborers.

Regular help is engaged by the month, usually for a period of nine months, beginning from about March 1. Extra help is secured by the day as needed, and both classes are employed without a written contract. A few hire for the year; but wages are paid on a monthly basis. The average wages are $16 to $18 per month, or $1 per day with board, or $1.25 per day without. These figures are for ordinary labor, about 50 per cent. being added for haying and harvest. Custom varies as to "chores," but, as a rule, wherever such duties devolve upon a man through the week, he expects to discharge them on Sunday.

We are fortunate in still being able to secure young men who are sober, industrious, honest and reliable—men who are working for an object, and to that end, labor for the best interests of their employer. This is what every one should do, and while such men are to be had I would have no others Such a man is a gentleman and should be treated as such, and may be safely made a member of the family. The only doubt or risk in the matter is to be sure he is that sort of man, which may only be known on trial.

I believe in stating the case plainly to a new man; in substance, that hiring him is strictly a business transaction in which he is expected to work for my interest; that I shall willingly pay him the highest wages, as I expect the most valuable service, and that no other will be satisfactory. As a protection to both, it should be fairly understood that when either party for any reason becomes dissatisfied, the agreement is to terminate. I want no unwilling services, and besides, I always reserve the right to be the judge whether the man is what I need. While I should not exact an agreement of him to be a gentleman, I should certainly discharge him if he proved to be anything else. Let it be plainly understood that quantity of work performed will not be the measure of efficiency, but that the quality must be of the best. I have seldom seen a man that did his work well who did not perform a fair amount of it. With a different class of help these plans would need modification, but this has been the custom at our place, and many of the best of men have rendered continuous service under it till ready to engage in business for themselves. Our best laborers are drawn from the same class of people as their employers, and are in every way worthy of considerate treatment.

City help has not been tried, and I have already stated my views upon cheap labor. I never employed any yet that did not prove an expensive nuisance. Inefficient help causes much weariness of the flesh and vexation of spirit, and a vicious man is an unadulterated curse. E. DAVENPORT.

Ingham Co.

FROM LONG ISLAND.

The problem of securing farm help is quite a serious one for both in-doors and out. Our help is mostly German with very few Irish, and a few negroes. Perhaps five per cent. are native whites of American parentage; 20 per cent. are born in this country of foreign parents; three per cent. are colored and the rest are foreign-born. Rarely one saves anything. I know of but three or four who are working places on their own account, and two or three who have built on lots and own their own homes, but still work out.

Yearly help is secured from the neighborhood, mostly men who have long lived there. Only extra for summer is secured from the city, or drifts along and is tried for a few weeks. If satisfactory, the hands are kept and may become permanent, otherwise they tramp on. Wages $10 to $18 per month with board; good day hands $1, without board. Usually no contracts are required. If several hands are employed, they do the Sunday chores in turn, or they do the chores morning and evening without extra pay if they are regularly hired; a man that will not help in doing chores is not usually kept long. The hands should be treated as men. The "golden rule" has always served me best. My head man has been with me 23 years next May without a quarrel. I don't like change and I change only for cause. Good men are always the cheapest, but are hard to get and poor ones will ask the same terms as if they were good. As in the work-shops, it is hard to scale prices. City boys are but little thought of, and when they are brought out here, they soon drift back to the city after the novelty has worn off country life. We are too near their old homes, for they can walk back in a day. I know of none that have been out here two years. H.

Creedmoor.

FROM KANSAS.

A majority of the farm laborers in our section are colored After them in point of numbers come American-born whites. Comparatively few are foreigners—Germans preponderating. Only a small percentage lay up money, but still some do. A number of tenant farmers among us began life as farmhands, and a few of our proprietary farmers started from the same level.

The supply of help with us is fully equal to the ordinary demand, so that no effort is needed to secure it from abroad except through potato digging, when it has to a small extent been imported from Kansas City and Lawrence. Wages are about $16 per month and board for eight months; day hands get from $1 to $1 50 per day, according to the pressure of work in the neighborhood. Contracts are rarely signed. Monthly hands generally have some regular "chores" assigned them, which they do Sundays as well as week days.

City boys have sometimes been brought out for extra busy times, but no persistent attempts have been made, that I know of, to break them in to farm work. The small experiences some of us have had with them have not disposed us to an extended acquaintance.

The question is not whether it is better to hire good men or poor at their respective prices, and will not be till there are enough good men to go round. My father used to say the "good hired men have farms of their own"—a rather extravagant statement of what is, after all, a general truth. And the really "capable" men who have failed on their own farms, can still do better than take the small wages that farmers can afford to pay them. We are left to do the best we can with the residue. Many of the perplexities of their employment and occasions for their short-comings might be avoided by simplifying their duties.

On the average farm, the hired-man is put at so many and such diverse jobs in the course of the year, that to do them all fairly well he needs to have an acquaintance with more processes and a familiarity with more details than it is reasonable to expect of him. Perhaps, too, he would do more if he were not so often shifted from task to task. The loss of time and effort imposed by the short pulls and frequent changes of ordinary farming is too often unjustly charged to the hired man's inefficiency. The farmer is, in a sense, a manufacturer, and he can, as it seems to me, with great profit to himself, imitate, as far as practicable and much farther than is commonly practiced, the method by which manufacturers in other lines secure fairly good service from unskilled and indifferent laborers; viz: by work within narrow limits. It is advantageous, also, to concentrate as far as possible, all the help on the farm on one thing at a time under the direction of the farmer himself or a competent foreman; then the shirk can be held to his task, the ignorant instructed, the careless prompted, the talker silenced and the whole gang watched and pushed.

Edwardsville. EDWIN TAYLOR.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

BONE AND WOOD CHARCOAL AS PURIFIERS AND DEODORIZERS.

V. L., Caledonia, N. Y.—Will a water filter made with what the seller is pleased to call animal charcoal, free the water from typhoid germs any more than vegetable charcoal? Will either do it?

ANS.—Animal charcoal has a mechanical as well as a chemical effect when used as a filter. Its mechanical effect is to catch and retain among its particles all suspended matter so that fluids passed through a mass of finely powdered charcoal flow away clear of this matter. Its chemical effect is due to various properties it possesses as follows: it is extremely porous, a cubic inch of it having a total surface, within and without, of about 100 square feet. Porous bodies like this have the power of occluding and condensing gases to a large extent, and oxygen is thus absorbed by charcoal to such an extent that it will sometimes spontaneously take fire and produce combustion, by the effect of the oxygen condensed into its pores. Animal charcoal is more porous than wood charcoal, because of the very intricate cellular structure of the bones of which it is made. Consequently liquids passed through a mass of charcoal are chemically purified by the oxidation and destruction of the organic germs which may be contained in them, and tainted meat is freed from its bad odor in the same way, and on account of the difference mentioned, bone charcoal is more effective than wood charcoal. But charcoal is not an antiseptic, but, on the contrary, an active agent of decomposition by oxidation; yet at the same time it is a deodorizer and disinfectant, because it absorbs and destroys by the same oxidation the new, malodorous products of decomposition as fast as they are formed. It might be interesting to mention here, that the purifying effects of common earth and the more active properties in this direction of black vegetable (carbonaceous) soils are due to the same porosity, aided by the presence of finely divided carbonaceous matter (a sort of charcoal) in it.

THE PECAN TREE.

C. E. P., Ocean Springs, Miss.—I have about 200 pecan trees five years old from seed. They are from four to seven inches in diameter. Will their nuts be like those of the trees from which the seeds were obtained? Would it pay to let them bear first, and then gradually graft or bud them with better sorts? Which would be the better—grafting or budding? What is a remedy for a greenish-white worm that destroys the pecan buds.

ANSWERED BY T. V. MUNSON, OF TEXAS.

Pecan trees grown from nuts taken from trees growing in the vicinity of other pecan trees or of pig-nuts (Carya glabra) will be more or less mixed with the latter. But if they are from nuts from isolated trees, most of them will closely follow the parent in characteristics. The pecan is what the botanists term monœcious. Every tree produces both the male and female flowers separately, and the pollen of a tree will either fertilize its own pistillate flowers, or, still better, those of other trees. At blooming time the pollen flies long distances in the air and may fertilize the pistillate flowers after being wafted for hundreds of yards or rods. Generally the experience of those who have planted fine pecans collected in the woods, is that among the seedlings there will be one tree in 100 or in 500, that will produce nuts as fine as those of the parent tree. If the nuts planted were extra fine, I would let the trees bear, and then top-graft all the inferior ones with the finest; but if the young trees are only one or two years old, and wood of very fine kinds can be obtained, I would graft the seedlings. For the greenish-white worm that destroys the buds, although I have no definite knowledge of it, I would, on general principles, try spraying the trees with the kerosene emulsion or Paris-green mixture. This would certainly destroy the tent caterpillars which do a great deal of injury to the pecan.

TOBACCO WATER FOR INSECT PESTS.

L. E. A., Smyrna, Del.—1. Can tobacco water be made strong enough to injure foliage of any kind? 2. How much tobacco will it require in a barrel of water, and how long must the mixture stand before it is strong enough to use? I want to try it on rose-bugs and the flea-beetle this coming season.

ANS.—1. Yes. But much depends on the sorts of plants, also on the age or consistency of the leaves. 2. Use a bushel of stems to a barrel of water. But here, again, much depends upon the strength of the tobacco—for it isn't all equally strong—and on the age and condition of the leaves on which the infusion is to be used. We generally steep it over-night, and in this way extract most of the strength from the tobacco; but if it is required for immediate use, we will get pretty strong juice in half an hour, or if we use boiling instead of cold water, in 10 minutes. When we have occasion to use large quantities of tobacco water, we fill the barrel with dry stems, then fill up with water and let the stems soak over-night. In the morning we use this

black water diluted with three times its bulk of clean water, for roses, chrysanthemums, and cherry and plum tips, being guided, of course, by the condition of the subjects operated on.

A GOOD AND CHEAP RATION FOR MILCH COWS.

C. H. B., Carman, Minn.—What is the best and cheapest ration for butter, made out of the following feeds? Wheat at 50 cents per bushel; oats, 35 cents; barley, 30 cents; shorts, $13 per ton; bran, $11; wild slough hay, $5, wheat and oat straw costing nothing.

ANSWERED BY HENRY STEWART.

The cheapest ration for the production of butter from the above mentioned foods would be as follows per day:

20 pounds of oat straw	——
6 pounds of oats	4 cents
4 pounds of bran	2⅓ cents

and as much of the hay as the cows would eat. The above ration would doubtless be increased one third in effect if part of the straw was cut, say, five pounds for each meal, and wetted and mixed with half the grain food finely ground, thus making two meals of cut feed and one of whole straw at noon. The butter made from this food, however, would be crumbly in texture and light in color, but it would have a good flavor, if it was not spoiled in the management.

WORKS ON RAISING AND FEEDING LIVE STOCK

C. H. S, Brooklyn, N Y.—What is a good work on stock raising and feeding and what is one on training Thoroughbreds? I would prefer works which explain technical terms.

ANS.—There is no single good work which treats of stock raising and feeding. The following are good works which treat of different parts of the broad subject—American Cattle, by L. F. Allen, price $2.50; Stock Breeding, by Manly Miles, $1.50; the Shepherd's Manual, by Henry Stewart, $1.50; Swine Husbandry, by F. D. Coburn, $1.75; Horse Breeding, by J. H. Sanders, $2; Feeding Animals, by E. W. Stewart, $2; Manual of Cattle Feeding, by H. P. Armsby, $2.50; Poultry Culture, by I. K. Felch, $1 50; Wright's Practical Poultry Keeper, $2. A good work on training Thoroughbreds, is W. Day's, the Race-horse in Training, $6.25. All of these can be obtained through the nearest book store, or from the Orange Judd Company, 751 Broadway, New York City.

THE "COMBINATION" FENCE.

L. B., Lawford, Va.—Has what is known as the "combination" fence been treated of in any of the past numbers of the RURAL? We think that there is no doubt that it is the most serviceable farm fence. It consists of wooden pickets woven together by strands of wire. There is no patent on it, but there are about 60 different patented machines for making it. A survey of them in the Patent-Office is quite bewildering. In deciding between their merits, the services of a mechanical expert and of a patent-lawyer would be necessary. It appears to me that it would be worthy of a paper like the RURAL to devote a special issue to the subject, and having worked it up thoroughly, to present the salient features of each machine, so that the farmer desirous of using one could tell which would best suit his purpose.

ANS.—Yes, we have frequently spoken of this fence, which is certainly an admirable one. We will consider the matter of such a special number.

ROSES.

J. B., Plymouth, W.—Among white, yellow, pink, and red roses, which are the most hardy, freest bloomers, and best adapted to a northern climate.

ANS.—Abel Grand, rose color; Anne de Diesback, carmine; Baron de Bonstettin, deep crimson; Baroness Rothschild, light pink; Boieldieu, cherry; Caroline de Sansal, flesh color; Gen. Jacqueminot, pinkish crimson; La Reine, rose color; Baronne Prévost, Madame Plantier, white; Coquette des Blanches, Harrison's Yellow, yellow. The above list are the hardiest roses we know of giving the colors desired. They are all hybrid remontants except Harrison's Yellow and one or two others whose origin is doubtful. The rose that is "most hardy, freest to bloom, etc.", is yet to appear.

THE POST OFFICE CLUB REPORTS.

A. W., Litchfield, Conn.—Was it owing to a loss of interest in "facts" and "figures" or to the absence of the "Schoolmaster" that "Small Pica" fell back on "sunshine" and sentiment in his last report of the "Post Office Club?"

ANS.—"Small Pica" is merely a reporter. He states what takes place at the Post Office Club, without any particular interest in presenting an argument. "The Parrot" is the only character that holds to a single line of argument.

Miscellaneous.

P. S., Swansea, Mass.—Is there any machine for banking celery?

ANS.—We do not know of one.

F. C. B., Lawrence, Kans.—Is there any work on frog culture?

ANS.—We don't know of any such work.

L. H. M., Shelburne, Mass.—What will kill black-knot on plum trees?

ANS.—Cutting back is the only remedy we know of. It is best to cut somewhat below the affected part.

C. L. J, Vergennes, Vt.—Where can I get a cheap telephone that will work well for 40 rods in a straight line?

ANS.—A telephone made by the Shaver Corporation of this city does very fair work.

A. A. M., Md.—Is there any effective destroyer of potato beetles, except Paris-green?

ANS.—We know of no preparation except Paris-green or other arsenical compound, that will kill the beetle without material injury to the vine.

F. E. W., Warwick, Mass.—Which is the correct name—McIntosh Red or McIntosh Red Canada apple?

ANS.—McIntosh Red and the Canada Red are different apples. There is no McIntosh Canada Red apple that we have ever heard of; but the McIntosh Red originated in Ontario, Canada.

W. A H., Homewood, Pa.—1. I want to plant 200 peach trees next spring; how would it do to plant strawberries with them? 2. What does the RURAL think of the Erie Blackberry and Souhegan Raspberry as market varieties?

ANS.—1. There is no objection. The strawberries will have passed their usefulness before the peach trees take possession of the land. 2. The Erie is said by several good judges to be the Lawton. The Souhegan is about the same as the Doolittle and a half dozen other kinds which it closely resembles. The Souhegan is as good as any.

F. A. C., Glendale, N. Y.—1. What two varieties of strawberries—one early and the other late—will do best on a sandy soil? 2. What red and black raspberries would do best on the same soil? 3. What is the usual price of tomatoes per bushel at the canning factories?

ANS.—1. We would suggest Manchester for late, and May King for early. 2 Cuthbert for a red raspberry, and Hilborn for a black. 3. The price varies somewhat according to the proximity of local markets. A firm in this city has a factory at Mateawan, N. J. They formerly paid 18 cents per bushel, but on account of the nearness of the city markets they have raised the price to 22 cents. About 20 cents per bushel would be a fair price for the grower.

F. K.P., Delevan, Wis.—1. In planting potatoes, does it pay to cover the seed-pieces with half a pint of slaked lime in each hill as a preventive of leaf blight and other pests. How should the "ounce of prevention" be applied? 2. Is land plaster much used in artificial fertilizers?

ANS.—1. We do not see that covering the seed-piece could have any effect in preventing rot or blight. This is merely an opinion. If lime were strewn in the soil where the tubers form it might have such an effect We cannot say. Our experience has been confined to sulphur. We have never had any rot or scab where powdered sulphur has been liberally used in the trenches. It is the R. N.-Y.'s opinion that much of so-called blight has been caused by the Flea-beetle. This we *know* to have been true in many cases the past season. 2. Not in high-grade fertilizers.

DISCUSSION.

BUCKWHEAT EXPERIENCE.

H. A. W., ERIE, PA.—Having read with much interest the numerous communications upon the buckwheat question, that have been published in the RURAL during the past few months, I have concluded to give a few facts from an experience of over 20 years. I am acquainted with only four kinds of buckwheat and I think there are no other kinds known to the trade to-day. The common black kind has been known to the oldest inhabitants as a standard, and has usually given a fair return for the labor of cultivation and a satisfactory quality of flour, but it is not as abundant a flour-producer as any of the newer varieties. Farmers usually conclude that any soil will produce buckwheat, as it receives a large percentage of its food from the atmosphere Then came the gray kind, like the black in the shape of the kernel, but gray in color, and producing flour a very little more in quantity but not better in quality. The average product of grain per acre of either of these was from 15 to 20 bushels. Sometimes on extra fine soil the yield would run up to 30 bushels; but this yield was very rare. The quantity of flour per bushel seldom exceeded 16 to 18 pounds. In 1880 I procured one bushel of 43 pounds of the Silver-hull, costing $4.65, thinking to sow it upon 1½ acre of clover sod, from which I had cut the crop on June 25. That night it rained very hard, and as the clover was lying in the swath, it, of course, became very wet. For two days and nights we had rain almost constantly. When the sun came out sufficiently to dry the crop, the latter was black and in many places spoiled. I soon put the plow at work turning the sod seven inches, and so completely covering the clover that one would not suspect that at least two tons of hay to the acre had been turned under.

After plowing, the ground was put in fine condition for the seed, and after applying 500 pounds of Bowker's superphosphate and two barrels of salt to the land, I sowed the seed, rolling the ground after harrowing. The result was the largest yield of straw I ever saw and 67½ bushels of very plump, nice grain. The thrasher who had followed the machine for years, said it surpassed anything he had ever seen. Remember the seed cost $4 65 a bushel (one of my foolish ventures) The following season I sold 55 bushels for $1 50 a bushel, while the old kind was worth only 60 cents a bushel. This kind has, for the last six years, been the standard for this section. It is first for the quality and the quantity of its flour, there being usually about 22 to 24 pounds to the bushel, and in quality it is sweeter and whiter than the flour of any other kind raised here. This kind is often advertised by seedsmen, for the sake of giving it a high-sounding name, as the English Silver-hull. The average yield per acre is from 25 to 35 bushels. When sown at the same time as either of the old kinds, it will ripen about one week earlier and the burning suns of September do not blight it as they do the old kinds. Last spring I procured eight quarts of the new Japanese buckwheat and sowed it on half an acre, by the side of two acres of the Silver-hull. The ground for both was prepared exactly in the same way, and both were sowed the same day, and in every way treated alike. The Japanese grew a very strong straw and ripened a few days later than the Silver-hull. The yield was at the rate of 36 bushels per acre, and the flour is in no ways superior to that of the Silver-hull either in quantity or quality. The kernel is much larger than that of either of the other kinds, though similar in shape and color to the old black kind. I cannot believe it will prove in any way superior to the Silver-hull. Were I to sow any great amount, I would stick to the Silver-hull, as it has stood the test for years. In all new varieties of seeds it is wise to go slow Having had quite an experience with different new varieties, I again, repeat: go slow with new sorts.

THE LENGTH OF ROOTS.

J. W. I., SUGAR RUN, PA.—The RURAL NEW-YORKER once asked the question: "How long are potato roots anyway?" I cannot tell, but, judging from analogy, I should say that in a fine, rich, mellow soil under favorable conditions, they grow five or six feet long. The person who pulls up a hill of early potatoes while the tops are green, and shakes off the earth may suppose he has got nearly all the roots, but such is by no means the case. The same is true of onions. I once had an onion bed on a hill side garden, the soil of which was a fine sandy loam. The bed was about four feet wide, the onions about full-grown and the tops still green. There came a shower in the night and a stream ran down over the bed until the surface dirt was all washed away and the roots were left bare, extending unbroken in every direction, and generally remaining in the place where they grew. In the morning when I visited my garden to see the havoc that had been caused by the rain, I was surprised, beyond measure, to find that onion roots were so long. Some onions that stood near the middle of the bed had pushed their roots in both directions to the outside of the bed; in other words, their roots were extended two feet on all sides. I would not believe it if I had not seen it myself. It is the common opinion that the roots of trees extend about as far out in the ground as the branches project out above it; but the truth is that they extend much farther. I have seen large trees, as well as willows, and alders, washed out by a flood in the creek, and in every case the roots were more than twice the length of the branches. The person who buys trees from the nurserymen may think he obtains about all the roots with the trees, but he does not get one-half of them. From what I know of other vegetables, I believe that potatoes of vigorous growth send out roots three feet in every direction where they are not opposed by some impediment, and that if there is richer soil or manure within four feet of where they are planted they will start for that the first thing, and reach it in a short time. The man who manures one row of potatoes and leaves the next without any manure as an experiment, to find out the value of commercial fertilizers, makes as great a mistake as the one who put his money into a contribution box, thinking it a savings-bank. If you manure one row of potatoes, the next row will steal part of the manure unless you interpose an impassable barrier of boiler plate or chilled iron.

GREEN CORN IN WINTER.

A. T. T., FRANKLIN PARK, NEW JERSEY.—An article in a late RURAL, related to prolonging the season for green corn. A neighbor of mine has had a similar experience. I was in his house during the latter part of November just at his dinner hour, and found him munching a fat ear, with a plateful of luscious ones close at hand.

"How long does your run on sweet corn extend this season?" was my not unnatural inquiry, considering that the weather had been quite severe of late.

"Well, unless some thief comes along and steals it, we expect to keep this up all winter," said he.

"Your corn grows right along I suppose now since cold weather and winter have set in?" I remarked.

"I can't say the stalks grow much," said he "but the corn grows—grows better in taste anyway. The fact is we had more planted than we supposed ourselves able to use, and when the early frosts of September came and froze the stalks and leaves, I imagined the corn was ruined The effect on the ears, however, was to improve the flavor rather than otherwise, and its natural tendency to harden has been permanently checked A good comparison, perhaps, may be noted in the influence of mustard on sweet cider, which "fixes" the cider so that the usual changes incident to age and fermentation do not take place. I have not cut the corn, and the stalks have been whipped bare of leaves by the wind and weather, but the corn ears hang on all the same, so that when the cook wants a supply for the kitchen, she goes into the garden and helps herself just as if it were mid-summer instead of winter"

"A truly wonderful labor-saving device!"

"Yes, that's what we think, and to emphasize the matter a little, there is no beating this plan of harvesting a corn crop. Perhaps I exaggerated a little in saying it will last all winter, but it will certainly hold out until it is used up, anyway."

"Exaggerate, indeed! That's a mild term for it. Why, my dear fellow, if you daily consume as big a pile as that now before you, your whole farm would have to be a cornfield to last all winter."

"Well, I admit I am rather fond of sweet corn myself. My neighbors are too. Sit right up now and help yourself; your mouth has been watering for some of this long enough."

KEEPING UP SOIL FERTILITY BY MEANS OF COMMERCIAL FERTILIZERS ALONE.

D. C. L., CRANBERRY, N. J.—In a late RURAL, C H. F., of Forestville, N. Y., asks, "What can farmers do without the cow, the sheep, and the ox? How is the fertility of the farm to be maintained without them? Can it be done with commercial fertilizers alone? Men who have tried doing so, tell us, no. My own experience tells me, yes. I have a farm of 100 acres, 90 of which are under cultivation. The sales of the products of my farm are now larger than they have been for any year of the 17 I have owned it, and I am keeping less stock than at any former period. Two working teams and three cows are all that I keep on the farm through the year. I also keep two or three steers through the winter to dispose of the corn fodder and coarser products. My farm to-day is more productive, growing larger crops than at any former period, and this improvement is brought about by the use of chemical fertilizers alone. I do not believe that the usual superphosphates will give such a result, as they contain too little nitrogen and potash in them; but when fertilizers of a high grade are used, excellent results can be secured. In one instance in Monmouth County, N. J., a field of 10 acres has not received any manure except chemical fertilizers, for about 13 years, and that field is producing double the crops it did under the old system, when yard manure, marl and lime were used. Now, this result has been obtained, not by use of ordinary superphosphates; but by the application of special and high-grade fertilizers.

R. B., ST HENRY OF MONTREAL, CANADA.—I was much interested in those letters on potato scab in a late RURAL. I find that to plant potatoes on land where grain grew the pre-

vious year, or where sawdust is in the manure, tends to produce scabby potatoes. I never have scabby potatoes after a crop of vegetables or on sod plowed under and well rotted. One-half of one of my fields is composed of clay loam; the other half of sandy loam. The former is likely to produce scabby potatoes; but I have never found any in the latter.

E. E. B., NORFOLK, VA.—I have been very much interested in the articles on pages 612 and 664 in the RURAL for 1888, on defects, etc. in mowers. I think they contain valuable ideas for farmers, and wish we could have more. Why not have a "Machine Special" describing new tools and contrivances, as well as the defects in old sorts, and how to remedy them, etc.? Let the farmers tell what improvements they want in their manufacture.

PROF. S. W. JOHNSON, NEW HAVEN, CONN.—Apropos of the "Concentrated Feed" recently exposed by Dr. Amsby in the RURAL NEW-YORKER, an analysis and estimates of it will be found in the report of the Connecticut Agricultural Experiment Station for 1884, pages 111 *et seq.*

What Others Say.

"THE RURAL NEW-YORKER is collecting from 100 to 500 rewards or souvenirs, to be given to a corresponding number of the most successful contestants, and proposes to extend the number of souvenirs as far as possible, and in this way help to secure a general interest and enthusiasm throughout the entire potato-growing country. Hundreds of its women subscribers are sending in their names for the "contest," while the number of gifts or souvenirs for the best yields already amounts to nearly $1,000. The committee to examine the reports and to award the prizes will be made up of persons (either men or women as preferred) whose names shall be a sufficient guarantee of strict, impartial action. The attention of World readers is called to this contest because it is a very laudable project, and one sure to bring desirable results in many ways."—N. Y. World.

DURING the present Congress 635 new public offices have been created involving an expenditure of $720,000 for salaries, while the salaries of 50 officers have been increased by $13,352. During the same session 405 public officers were practically dropped by omission to provide payment of their salaries, thus saving $470,028 to the Government; while in the case of seven officers salaries were reduced $1,487.....

THE UNITED STATES BEET SUGAR INDUSTRY.—Claus Spreckels vigorously opposes the proposed reduction in import duties on sugar, and says that the compensating bounty of one cent per pound on home-produced sugar, to be granted by the Republican tariff bill, isn't enough. His California beet sugar factory cost $400,000, of which $45,000 were paid as duty on machinery imported from Germany simply because no suitable machinery was made here. His will serve as patterns for future machinery to be made at home. His factory at Watsonville, Cal., has a capacity of 350 tons of beets every 24 hours; and it has run up to 379. Operations began about Oct. 20, 1888, and ended on Dec. 20. There were received at the factory 15,000 tons of beets from 1,000 acres, averaging 15 tons to the acre. The farmers received, on an average, $5.52 per ton for their beets, or $82.70 for the product of an acre. The highest product from the best cultivated land was 40 tons per acre. In Germany the best beet crops average from 20 to 25 tons per acre; but there the land is better tilled and, moreover, it is fertilized at a cost of $15 per acre, every three years; but experience has shown that the rules for cultivation and seeding in Germany are not suitable for the soil and climate of California. Only one-third of the seed used in the former is needed in the latter. While the average saccharine contents of California beets was 11¾ per cent., that of German beets ranges from 10 to 14 per cent.; but in some instances California beets contained upwards of 20 per cent of sugar. The results of the season's work at Watsonville were 1,640 tons of sugar, which netted a profit of $29,930 or nearly $20 per ton, representing a return of seven per cent. on the outlay for machinery and buildings, without allowing anything for the wear and tear of the machinery.

The duties on sugar average as high as 76 per cent. and the new Republican tariff bill proposes to cut them down to 37 per cent. and, as an equivalent for the reduction, it offers a bounty of one cent per pound to domestic producers. This would be $20 per ton, so that the home producer would have an advantage of 67 per cent. over the foreign producer, instead of 76 per cent. as at present, so that there would still be a reduction of nine per cent. against an average of 12 per cent. proposed by the Democratic Mills bill.

This reduction Mr. Spreckels thinks would put a stop to any further progress in beet sugar manufacture in this country, as the profits now are less than seven per cent. on the capital invested, if allowances are made for deterioration of the plant. For the fiscal year ending June 30, 1887, we imported 1,459,076 tons of sugar; while in the following year the imports were only 1 235,872 tons—a decrease of 223,000 tons, which Mr. Spreckels attributes to the increase of domestic sugar. As the duty remains to-day, he is confident this country can profitably produce all the sugar required for home consumption. This would be a fine thing for farmers wherever sugar beets could be grown for $82.70 per acre!

CUTTING POTATOES FOR SEED.—Bulletin No. 13 of the Vermont Experiment Station gives an account of the result of planting different-sized seed-pieces of potatoes. The following table fully explains it. The rows were 50 feet long and three feet apart, the seed two feet apart in the rows:

No. of Plot.	METHOD OF CUTTING.	Whole Number of Merchantable Tubers	Weight of Same.
			lbs. oz.
1	Large whole tubers, 10 ounces each	150	32—11
2	One-half tuber, cut lengthwise	137	30— 6
3	Medium tuber, sprouts on, six ounces	148	30—..
4	Medium tuber, sprouts off	155	37— 4
5	Medium tuber, ridged	138	24—12
6	Small tuber, quartered, two ounces	104	31— 9
7	Halves of seed-ends, medium tuber	134	40—12
8	Quarters of seed-ends, medium tuber	144	38—14
9	Single eyes, cut shallow medium tuber	117	30—..
10	Single eyes, halved, medium tuber	39	9—10
11	Single eyes ridged, medium tuber	78	15—10
12	Seeds four weeks dried, medium tuber, quartered	38	15— 5
13	Medium tubers, mulched when four inches high	176	46— 9
14	Medium tubers, mulched when four inches high	182	43—14

As usual in such trials, the results are very contradictory.

"THE WOMEN'S POTATO CONTEST."—The following is taken from the N. Y. World of January 2d:

"THE RURAL NEW-YORKER proposed, some three months ago, that its lady readers should enter into a potato contest of their own. In the way of suggestion, it was proposed that the plot be 33 feet square, or just one-fortieth of an acre. This is a very convenient size and shape. The plot may be larger, but not smaller. Each contestant will choose her own method in every particular, the kind and quantity of fertilizer or manure, the variety of potato, the distance apart to plant, etc. etc. It will not, of course, be required that the contestant do all of the actual work herself, but merely that it be done under her direction and supervision. The aim will be to produce the largest quantity of merchantable potatoes on the chosen area at the least cost: the standard of what constitutes a 'merchantable' potato to be fixed hereafter. The reports (to be satisfactorily substantiated) will give the full particulars as to the kind of soil, fertilizer, manure, variety of potato and method of culture, and are to be handed in before the first of next October."

IT looks as if the farmers were getting a trifle discontented at being always kept on the back seats in politics. Some of them want to do something more than vote for others at the polls. They want to elect their fellow farmers to the Legislatures of their respective States. Nor does this content them: many of them want to be represented by men of their own calling in the House of Representatives at Washington. Nay, they have even the audacity to want to send farmers to that nest of millionaire capitalists and corporate agents—the United States Senate. S. B. Alexander, their candidate for that body in North Carolina, is running Senator Ransom and his railroad backers a hot race. In Delaware also the Senatorial fight is between the candidates of the farmers and the railroads. In Minnesota, too, the granger element is taking a front place in the Senatorial fight against Sabin, and if their efforts were more concentrated, good judges think they would come out ahead. Farmers are beginning to appreciate the truth of the old, old adage that God helps those who help themselves. Of course, the political papers, as a rule, discourage this new departure; but there is a strong probability that they will have to become accustomed to it.

THE NEW AGRICULTURE.—The Sun talks, rather sarcastically, of the "New Agriculture." It says that the system was discovered by that irrepressible, electrical veteran, Asahel Newton Cole, of Allegany County, N. Y., and the right place to make a conspicuous and triumphant display of its marvelous results is here at the doors of this metropolis, among the hills of Westchester. The land is there, its long slopes turning to the southern sun; the living springs of water are there; the climate is favorable, the situation peerless, and all that is necessary s that some great and far-seeing man, with as much money as he has brains, should devote a little thereof to a work whose success will not merely make its capitalist glorious and famous, but also increase his wealth beyond the wildest dreams of avarice. What wise millionaire, what rich and great philanthropist, desirous of being the benefactor of the human race, of putting an end to hunger and poverty, will come forward and lay hold of this unexampled opportunity to gain for himself imperishable renown, and to confer upon his grateful countrymen the benefits of universal prosperity and boundless abundance?

IN FAVOR OF DEHORNING.—When the craze for dehorning cattle sprang up at the West some years ago, looking at it from a distance of a thousand miles or more, it looked like a mighty cruel business to take a saw and cut off the horns of all the animals on the farm. During Mr. J. H. Hale's recent visit to the West, as reported in the Conn. Courant, he noticed, in several counties of Illinois and Wisconsin, thousands of cattle that had been thus treated, and at a farmers' institute in Grant County, Wisconsin, he asked for a little information with the following results. Thirty-six of the farmers present had each dehorned from 9 to 600 head. Not a single animal's life had been lost; two cows were reported as having given less milk for a few days. Not a single one of these farmers yet had any reason to regret his work, and most of them were confident that their cattle were doing better in winter on less feed than ever before. Most of them have abandoned tying up cattle and now turn them all into the stables together, as there is no danger of injury from hooking. It was not thought best to dehorn young calves as they are likely to form a habit of bunting, but by leaving the horn on till the animal is two years or more old, they learn to use them; and when they are once removed they realize their weakness, and become very peaceful. After this testimony and thinking over the list of Connecticut farmers who have been seriously injured during the past ten years by the horns of various farm animals, Mr. Hale is convinced that dehorning is a modern idea that has come to stay and that we shall keep sawing off the horns till such time as nature shall breed them off.

POLLUTED WATER AS A SOURCE OF TYPHOID FEVER, ETC.—At the meeting of the American Public Health Association the other day, Dr. Charles Smart, surgeon in the United States Army, presented an important paper on the pollution of water supplies. A few years ago it was popularly assumed that some system of artificial filters, either those composed of masses of sand through which the water was compelled to pass on its way from the reservoir to the supply pipes, or domestic filters, would serve to remove the germs which produce typhoid fever and other kindred diseases. Dr. Smart holds with nearly all those who have studied the subject, that such filters, though they may afford water apparently of the purest kind, really do not serve to separate the poisonous elements from it. He cites a number of important instances which have a bearing on this point. He notes the fact that in case of the poisonous water which bred the dreadful epidemic in Plymouth, Pa, where hundreds of the 8,000 people were affected by typhoid fever, and 130 died from the disease, the water was passed through three storage reservoirs on its way to the distribution pipes. In a similar epidemic at Lauzun, in Switzerland, the germs had passed through what seemed to be perfect filters. His conclusion is that water which has once been contaminated can never be safe for use. Dr. Smart states that 30,000 people die of typhoid fever each year within the limits of the United States. If we allow that the average death rate is one in ten of those prostrated by the disease, we have an appalling amount of illness due to this malady. The probabilities are that the average death rate is one in 15, or perhaps even less, so that something near one-half a million people probably undergo each year a long period of illness and consequent enfeeblement of body owing to this disease.

POINTERS.

THE disposition to go to extremes has to be met on all sides, says Dr. Hoskins, in the Vermont Watchman. One would hardly have supposed, ten years ago, that any agricultural writer would be so soon obliged to make this cautionary remark. But after painstaking experiments, running through six months, with all kinds of rations, Professor Whitcher, of the New Hampshire Agricultural College, found that cows fed 50 pounds of silage and eight pounds of rye hay, costing 11.02 cents per day, did as well as they did when fed 15 pounds of hay, 15 pounds of cut corn-stalks and eight pounds of meal, costing in all twenty-six cents per day. The silage was made from thinly-planted and eared corn.

SEE that the seed corn is in a dry place free from frost.....

PROFITABLE crops are always a subject of interest. And among other catch crops which give little trouble, but yield much profit, the pickle cucumber is one of the best. A farmer in Connecticut, says the Times, planted an eighth of an acre last year and gathered 43,000, which sold for $107.50, leaving a profit of $69, or at the rate of $552 per acre. These things are required for profit in this crop—rich, well-manured land, well cultivated; the right kind of seed, Green Prolific being the best, and near-by market, or else ability and opportunity to pack the pickles in brine in barrels for sale at a later season.....

TO PRODUCE milk Mr. Hoffman of the Elmira Club (N. Y.) said that no other root he had ever fed was at all comparable to the potato. He would have no hesitation in feeding potatoes, liberally, even if butter were the object. Another speaker who had fed many potatoes, and for considerable periods of time, declared them excellent for butter making. He would feed them with corn meal and wheat bran, for that had been his successful practice .....

MR. J. J. THOMAS says that the Summer Doyenné still remains the most popular early pear; that Giffard, following it, is larger in size and superior in quality. Frederick Clapp, one of the newer pears, promises high value. P. Barry places Superfin near the head of the list for excellence of quality.....

IN Henry Stewart's practice in the dairy, in which he has made a great many experiments and tests, he has found that when milk is set in shallow pans at a temperature of 60 degrees to 62 degrees for 36 hours, and then skimmed every 12 hours, the cream may be kept to the end of 36 hours at the same temperature, to arrive at the best condition of ripeness. And cream taken from deep pails skimmed every 12 hours, after 24 hours setting at 45 degrees may be kept 48 hours at a temperature of 62 degrees to get the proper degree of ripeness. To reach this perfectly as he states in the Albany Cultivator, the cream must be gently stirred from the bottom to the top and thoroughly mixed when new cream is added, by which the fresh cream is soon brought to the same degree of acidity as the older cream, the acidity of which is partly neutralized by the sweet cream added. This thorough mixing is important, as it equalizes the acidity or ripeness of the whole quantity.....

IT has been maintained that there is a loss of butter in the sweet cream by this mixing, and that to get all the butter, or the largest quantity of it from cream, it must be kept or exposed to the air, or ripened, or oxidized (all these mean the same thing), by itself and churned by itself. This, however, is a mistake, and Mr. Stewert avers most confidently that the mixture of the cream as above stated, will be equally effective for butter product, and the results of the churning will be the same as if every skimming be kept and churned by itself.....

THE best "starter" for ripening cream is sour cream, or even sour milk, if it is not desirable to afford the requisite time and exposure to the air in the usual way in which cream is kept. He has found that six hours' time is

ample for perfecting the equalization of the cream after the last addition of sweet cream has been made, and it has been well mixed by stirring with a large spoon or a broad wooden spatula.....

AMONG the suggestions received by the Senate Finance Committee concerning tariff schedules is one from the West that a duty of one cent a dozen be laid upon all eggs imported into the United States. The writer says that there is just the same argument in favor of protecting eggs that there is for protecting wheat or corn. He argues that if the tariff is laid upon eggs it will satisfy the women of the agricultural districts, to whom the management of this industry is almost unanimously conceded by the sterner sex. ..

THE State Grange of Virginia petitioned Congress to give a bounty of 55 per cent. on exported agricultural products. The resolutions say that the present tariff protects manufactures at an average rate of 55 per cent., and agriculture at only 20 per cent., and that as any protection afforded by tariff laws would be ineffectual owing to the fact that our agricultural staples are produced in excess of the demand and have to seek a foreign market, therefore, a bounty should be allowed.....

IN anticipation of the proposed utilization of a large part of the sewage of Paris by irrigation on the fields of Acheres, a commission appointed by the French senate recently visited the irrigation fields at Berlin. These are now in working order and furnish the most extensive example of sewage purification by irrigation in the world. Berlin now contains more than 1,300,000 inhabitants, having trebled in population, during the last 20 years. In the outlying districts the cess pool is still used, Science says, but the whole of the closely built portion of the city, containing 1,150,000 inhabitants, is thoroughly sewered, and all waste matters from this part of the population are carried by water to the pumping stations, from which they are distributed on the irrigation fields.....

THE PHILADELPHIA PRESS, commenting upon the R. N.-Y.'s question: "How often should cows be fed?" says that whether the food is furnished in two meals a day or three or four is of small moment comparatively, so long as the meals are timed with scrupulous punctuality. No doubt she can adjust her apparatus to three feeds or less or more, but plainly it suits her easy-going, ruminant nature best to have feed coming around with astronomical punctuality as regularly as the earth or moon revolves. If her meals come haphazard she will need to make a new time table for her stomachs every day, and they can not do as efficient work as when they settle down to an established schedule that never varies .....

THE PRESS is certainly right in assuming that it is poor policy to buy a show animal—for that implies a pledge to give it show treatment. And if you are trying to hunt up some kind of stock that can live with little to eat and with less care, this is the very worst possible investment. The disappointment and shock which a pampered animal receives are too great. It should be a rule never to buy stock that you cannot keep in as good style at least as that to which they had been accustomed. Well-bred animals are always the best to buy, provided they have been brought up on good healthy food and with proper care.....

AFTER 30 years' use of stanchions Mr. John Gould decrees that they must go to the woodpile, and his new stable is furnished with double stalls and neck chain ties that allow great freedom of motion, and by the shoulder partitions they are afforded no chance to use their horns on their neighbors. They lie down and rise up in comfort, and can sleep with their heads on their sides or rest their muzzles on the manger boards and dream of full baskets of coming silage. When he sees them so comfortable he kicks himself for hanging on to stanchions so many years because they were handy. The argument for the stanchion was all on his side. The comfort of the cow and her wishes as to freedom of movement were not considered.....

THERE seem to be but three ways for a nation to acquire wealth, said Franklin. The first is by war, as the Romans did, in plundering their conquered neighbors—this is robbery; the second by commerce, which is generally cheating; the third by agriculture—the only honest way wherein a man receives a real increase of the seed thrown into the ground, in a kind of continued miracle, wrought by the hand of God in his favor, as a reward for his life and his industry.....

LAST year our first "greens" came from the cultivated dandelion. The variety called French Garden is offered by seedsmen at 20 cents the ounce.....

PREPARE for the next meeting of the American Pomological Society to be held at *Ocala* Florida, beginning Februar A cordial reception awaits the members and visitors.....

MR. CRAWFORD, in Popular Gardening, says that in an experience of over 30 years he has never seen strawberry plants injured by too deep a covering if uncovered early enough in the spring. He has seen beds covered with six inches of soil, that were in perfection in the spring.....

MEMBERS of the New Jersey Horticultural Society are of the opinion that the old Lawton and the new Erie blackberry are the same.....

THE question is raised by S. B Keach, whether the Signal Service is not a signal failure.....

OUR respected friend, J. J. Thomas, says that the Shaffer raspberry has exceeded any other of the new varieties for the short period it has required for a general approval, East and West, throughout the country. It exceeds any other variety he has tested in its invariably heavy crops. The berries are large, and uniformly free from distortion or any defect in form .....

OUR friend E. P. Powell, an experienced fruit grower of Clinton, N. Y., mentions, in Popular Gardening, several pears which for one reason or another he prefers. He thinks there is no early pear equal to the Tyson. Season August. He prefers Clapp's Favorite to the Bartlett, in which preference the R. N.-Y. disagrees with him. Howell is a grand and handsome pear either as a dwarf or standard. Sheldon, Mr. Powell thinks, is the finest table pear in the word. Picked early in September and stored in a cool cellar, it will be in good order for two months. Louise Bonne should be left on the tree till frost, and then placed in a cool room to ripen slowly. Anjou is the noblest Roman of them all. The Jones pear, Mr. Powell says, promises to be the best for mid-winter, and Josephine de Malines for late winter.....

THE Arkansas Experiment Station, Fayetteville, set out 165 varieties of grape-vines last spring, many of which were affected with the downy mildew. On July 1, the Eau Celeste, or blue water, was applied with satisfactory results. The mildew was completely checked, no further application being made for six weeks, when it appeared again, this time mostly on new foliage and on varieties not previously affected. The station does not recommend waiting until the mildew has appeared, but to apply the solution as a preventive to all the varieties subject to the disease. .....

THE Eau Celeste was made as follows: Dis solve one pound of sulphate of copper in two or three gallons of warm water; when completely dissolved and the water has cooled add one pint of commercial ammonia, then dilute to twenty-two gallons. Use a force pump and a spraying nozzle.....

GEO. W. CAMPBELL, in Green's Fruit Grower, speaks out loudly in favor of the Woodruff Red Grape. He says that *quality* is a matter of individual taste to such an extent that he never questions any one's opinion on that point. But nine out of 10 who have tasted the Woodruff in his presence have expressed delight as to its quality, and pronounced it *very* good. And about 19 in 20 would call it at least good. He has heard parties express a preference for the Woodruff over the Delaware! For himself, while he would not call it very poor, he would not class it very good; but he thinks it as good as Concord or Niagara, and it is earlier in ripening than either. He thinks also, it will be for general culture one of the most popular and generally useful red grapes we have. It is so strong in growth, so productive, so healthy in foliage, and so perfectly hardy, combined with large size, beautiful color and early ripening, it must be popular and valuable, especially for market. And its quality will be found *good enough* for the great mass of buyers and consumers.....

ALL that Secretary Campbell says of the Woodruff the R. N.-Y. can substantiate from its own trial of a vine dug up and thrown away two years ago, except as to quality. It is as foxy as many wild Labruscas, and the pulp is as tough.....

FROM a recent bulletin issued by the University of California Experiment Station, we learn that two-ounce packages of seed of Pyrethrum cinerariæfolium and roseum (Dalmatian Insect plant) will be sent to applicants forwarding two cents for each package.....

THE station will also supply cions of many different kinds of fruit trees—10 cents for each dozen cions. The varieties may be selected from the University report of 1886 on pages 130 to 140. All applications must be made to E. J. Jackson, Berkeley, Cal.....

WORD FOR WORD.

——HERALD: "No one ever can or ever will know half as much as a young man of 20."....

——N. Y. TIMES: "Just now there is a tendency to adopt the old discarded favorites, the Saxony and Silesian rams again, and to displace the large French sheep and to favor the production of light, fine fleeces, instead of the heavy, coarser ones, which are always more profitable and always will be so long as wool is sold and bought as it is now, has been, and probably will be for years."

——GLEANINGS IN BEE CULTURE: "I feel called upon to say amen to the statement that digging potatoes is just as honorable as preaching the gospel, or controlling large banking interests. May God be praised that it is my privilege to dig potatoes at least part of the time."

——CHRISTIAN UNION: "Steady work for the love of it, and for the satisfaction and peace which it brings, never breaks the worker down. On the contrary, it so weakens temptations from without, and so destroys inferior ambitions and desires, that it gives the whole nature steadiness and poise. It is the best cure for restlessness. The joy of life for strong natures lies in a noble activity a work adapted to the aspirations of the soul; a work that brings calm by its magnitude, and by its very demands evokes the best and greatest in us."

——DAIRY WORLD: "Hon. J. Irving Pearce, the proprietor of the Sherman House, Chicago, under date of Dec. 2, 1888, writes as follows concerning the carcass of the pure-bred Jersey steer exhibited at the late American Fat Stock Show and purchased by him of the Michigan Agricultural College: "You ask how I like the carcass of the Jersey steer that I purchased of the Michigan Agricultural College. I do not think I ever used finer meat. I bought of the college meat from all the animals (Short-horn, Hereford, Devon, Holstein, Galloway and Jersey), they had on exhibition at the Fat Stock Show, and put them on our ménu as premium beef. The Jersey was pronounced by all, without hesitation, as the finest in quality and flavor and the tenderest of any beef they ever ate. I had the Jersey meat for Thanksgiving dinner, and do not think any one tasted it without remarking that he never tasted such meat."

——IDEM: "A farmer had a boy who showed no special aptitude for business, and he was puzzled what to do with him. He concluded to try an experiment, so he locked the boy in a room in which there were only a Bible, an apple and a dollar. A few minutes later he stole quietly to the room. He made up his mind that if he found the boy eating the apple he would make a good farmer. If he was reading the Bible he should be trained for the pulpit, and if he had taken the money his success as a broker, the father thought, was assured. Upon entering the room he found the boy sitting upon the Bible, eating the apple, with the dollar in his pocket. The boy became an able politician."

——GERMANTOWN TELEGRAPH: "Don't you think it time for our lawmakers to accept smaller salaries commensurate with the changed condition of things? A hundred cents will now buy a dollar almost anywhere, while the same cost 285 cents when the high salaries were fixed where they remain yet, and the farmers are working 'tooth and nail' to make both ends meet and pay these salaries."

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

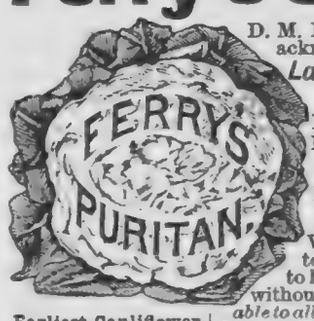
MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

Trees, Seeds and Plants.

☞OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds



Earliest Cauliflower in existence.

D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* in the world.

D. M. FERRY & Co's Illustrated, Descriptive and Priced **SEED ANNUAL** For 1889 Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JANUARY 26, 1889.

THE RURAL NEW-YORKER for 1889, will be, as hitherto, invariably, $2.00 a year for single subscriptions, and $1.50 in clubs of five or more.

Farming is my ideal life; therefore I am a farmer. E. Y. LYON.

ONE of the best evidences that the R. N.-Y. No. 2 potato is a superior variety is that there are so many parties claiming that it is their seedling, which the R. N.-Y. has appropriated. Thus, you see, how delightful it is to help on agricultural progress by original contributions.

I have seldom seen a man that did his work well who did not perform a fair amount of it. E. DAVENPORT.

THE R. N.-Y. never varies its rates (as published in every issue), for advertising. All advertising patrons are treated precisely alike. This statement is made every year at about this time, in order to spare intending advertisers the trouble of any correspondence with a view to obtaining lower rates. There are but few journals published in this country whose rates are absolutely invariable. The RURAL NEW-YORKER is one of the few.

PRES. W. I. Chamberlain proposes, in a few weeks, to favor the R. N.-Y. with a series of short articles which will discuss, in a popular way, the rights of person and property and their limitations in society and under government, especially the limitations of property under commerce and when invested in monopolies. This covers the ground of land ownership, taxation, control of commerce, especially in regulating weights, measures and currency, and forbidding and punishing counterfeiting and adulteration. It also covers the ground of patent rights, railway property, pools, trusts, grain and stock gambling; in short, all that tends to interfere with or "corner" the prices of necessities of life.

The time has come when farmers must "earn their bread by the sweat of their brows" (brains) and not wholly by their hands. Hence the *prices* of what they raise as affected by the above, are fit subjects to be discussed in an agricultural paper, following on our first-page cartoons.

"There is no such thing as a cheap man. You must either pay full wages for a capable man, or hire an incapable man at a serious loss. Generally speaking, these "cheap" hands are worth considerably less than nothing. They do not often ask me for a job."—T. H. HOSKINS, page 50.

FROM a recent decision of the Supreme Court of Iowa, it is evident that no mitigation of the rigors of the prohibitory laws of the State can be expected from its judicial tribunals. The Court has just decided that any drink containing ever so small a quantity of alcohol is "intoxicating" within the meaning of the State Constitution. In the case in question, the Court below had decided that a certain drink called "Cummings" was not intoxicating. Chemical analysis showed that it contained only three per cent. of alcohol, and the chemists testified that it did not have an intoxicating effect except in cases where persons wholly unused to alcohol might take large quantities of it. The Court, however, held that in the meaning of the law it was immaterial what effect the alcohol might have upon the drinker. The stuff is intoxicating and remains such as a drink, no matter how much it may be diluted or disguised in other liquors. The same principle applies to cider and perry, the sale of which is illegal in the State. The farmers of Iowa, however, can well afford to lose any profit from the prohibition of the sale of these beverages in their own State in return for the blessings of peace, economy and morality that go hand in hand with rigidly observed abstinence from intoxicants.

"A bath-tub with water handy should be found in every farmer's home, and the hired man should be made to feel free to use it every night during the heated term. He will do more work the next day."—T. B TERRY, page 50.

GOOD.

THE souvenirs contributed up to the 19th inst. to the Women's Potato Contest amount, in money value, to over $1,000. The entire list will appear in a few weeks.

"In so far as it is practicable, it seems to me in every way desirable to try to furnish work throughout the year to desirable men, rather than compel them to be idle and on expense during the winter, or, at the best, to seek employment elsewhere."—PROF. G. E. MORROW, page 51.

CONCENTRATION BETTER THAN DISPERSION.

THE Ives bill, which became a law in New York State, in 1887, gave certain racing associations the privilege of selling pools within specified limits of time and place, and on condition that they should pay to the State Comptroller five per cent. of their gate-money. Under this law, $22,619.10 or $23,139.69 (reports vary), were received by the Comptroller in 1887, and $25,012.61 in 1888. Section 5 of the law provided that all revenues from this source should be "annually distributed in behalf of the State for prizes for improving the breeds of cattle, sheep and horses at the various county fairs throughout the State, by the State Agricultural Society." No disposition has hitherto been made of any of this fund, which now amounts to about $48,000. There are 59 counties in the State, so that about $800 which should go to each county society, according to the provisions of the law, are still in the Comptroller's hands. This is due to the action of the town associations, many of which are stock companies—mere private affairs. Last year their friends in the Legislature opposed the distribution of the money among the county societies alone, and a bill was introduced to allow the private stock associations to share in the "fund." It was vigorously opposed, however, and defeated, but the distribution of the fund was suspended. The town associations are again on hand to press the passage of the measure this winter. The county associations insist that it was mainly by their aid that the Ives bill was passed; that the law intended that the money should go to them; that if the town associations share in it, the tendency will be to induce the organization of more town associations, whereas the county societies even now find it difficult enough to pay premiums and running expenses. They will, during the present session of the Legislature, urge its members to stand by the law distributing the money exclusively among them. They are now considering the feasibility of sending delegates to a meeting to be held at Albany on January 31, for the purpose of organizing in support of their view of the question. It seems to us that their view is the right one. What public benefit can result from frittering this fund away among a multitude of associations, with many of which the notion of benefiting the public is altogether subordinate to the effort to benefit themselves? The farmers of the Empire State should promptly inform their representatives, in both branches of the Legislature, of their conviction on this subject.

"A poor, blundering, careless man will lose every year more than would pay for a good man, through mistakes and carelessness in leaving gates open and fences down, and also tools out in the rain and sun to rust and warp."—H. A. MARCH, page 57.

ENSILAGE CORN.

ENSILAGE PEOPLE—your ear! Tell us why you advocate the use of B. and W. corn? B. and W. corn means, as nearly as we can find out, Southern corn of any kind, of which there are 100 or more different varieties. Southern corn, that known as such, grows to a great hight—12 feet or more. The joints of the stalks are far apart; the leaves, as compared with the stalk, are few. We have a maximum of stalk, a minimum of leaves. Is that what you ensilage people want? If so, why not settle upon a known variety, such, *e. g.*, as the Chester County Mammoth? This variety does not sucker much. The main stem grows, at the Rural Farm, from 10 to 12 feet high. It bears, generally, one fine ear a foot long, with from 14 to 30 rows of kernels of rather large-sized yellow dent. What's the use of talking about B. and W. corn if it does not mean anything but Southern corn?

Now, the R. N.-Y., some 10 years ago, distributed among its subscribers a variety of flint corn called the RURAL NEW-YORKER Thoroughbred. *Thoroughbred* indeed it is, having been grown, far away from other varieties, for over 40 successive years. The ears are remarkably long, often measuring 14 inches. The kernels are broad, though not deep. For a flint corn it is soft. Each kernel, in good soil, will give from three to four stalks which grow so large that it is impossible to say which is the main stalk and which are suckers. Each stalk will generally bear one ear. The stalks are short-jointed, the leaves are *many* and *broad*. One-quarter of the seed usually planted will suffice on account of its suckering propensity. *Why not use this corn for ensilage?* We ask for information. Messrs. Gould, Henry and Co. kindly tell us why not. It is needless to say that the R. N.-Y. has no pecuniary interest in this variety. It has never *sold* a cent's worth of it, or of anything else whatever to any subscriber. It is against our principles to sell anything except the R. N.-Y. And there is not one of our subscribers, old or new, that can say otherwise.

"The crying evil of the time here is the servant girl question. The supply of good girls is utterly inadequate to our needs. In this the city ought to help us, but it does not."—C. F. EASTMAN, page 51.

UNDER-TAXATION OF PERSONAL PROPERTY.

ACCORDING to the census of 1880, the assessed value of land in the United States was $13,036,766,925, and that of personal property only $3,886,000,000, making the total assessed valuation about $17,000,000,000. From all accessible data, however, the best statisticians then put the value of the property of the country at $50,000,000,000, the census estimating its true value at over $43,000,000,000, and it was thought that at least one half of that amount consisted of personal property. In some of the States, of course, the disproportionate value of the personal property was very much greater than in others. The disproportion between the assessed valuations of both kinds was, of course, least where the population was sparse, and greatest where the population was dense and wealth in the hands of a few. In the large cities where there is certainly much more personal than real property, the inequality was maintained. The explanation of this unjust disproportion is plain. Land cannot be concealed; nor can it be undervalued as easily as personal property. There is more difficulty in concealing property in sparsely settled than in thickly settled sections, in the country than in cities. The very nature of all sorts of property owned by country people renders it impossible to conceal it as easily as city property. In the cities, too, people are accustomed to attend to their own business; in the country many attend to their neighbors' also. Although since the census the personal property of the country has been advancing in value considerably more than the real estate, the tax returns of the various States show that taxation on it has been, every year, proportionately diminishing.

As owners of most of the real estate, the farmers of the country are the chief sufferers from this unfair inequality of taxation. Of the $13,036,766,925 assessed value of the land in 1880, the value of the farms was $10,197,096,776. A moment's thought will leave no doubt that while the farmers pay an unfairly large proportion of the State, county and municipal taxes levied for the protection of life and property, their property requires the least protection. Land and fixtures thereon cannot be stolen. The whole expensive array of militia, sheriffs, police, judges, jailers, is chiefly engaged in protecting personal property, or in punishing offenders against it. In addition to the flagrant injustice to farmers arising from the escape of personal property from its proper proportion of taxation, other evils result from it. Those who own this kind of property are generally careless as to the expenses of the government, to which they contribute little or nothing; yet the wealth of a majority of the members of our State and National Legislatures consists in stocks, bonds, mortgages and other forms of personal property, which, wholly or in part, escape assessment. If these men shared fairly with real estate owners in the load of taxation they impose on the people, they would be much more likely to make the burden lighter.

There is a good deal of discontent and quiet agitation in reference to this matter in a large number of the States at present. In Massachusetts the disproportion between the taxation on both kinds of property is stigmatized as "absolute injustice" and "legalized robbery." In round numbers, the valuation of all the property of that State for the purposes of taxation, is about $2,000,000,000, of which only $500,000,000, are returned as personal property, although it is notorious that the value of the personal property in the Bay State is much greater than that of the real estate. In Ohio the authorities complain that they cannot reach a tithe of the personal property justly liable to taxation. Throughout Illinois there is a loud cry against the wholesale exemption of this kind of property from taxation. Everywhere real estate bears nearly the entire load of local taxation, and the little contributed by personal property is unequally and unfairly distributed, as it comes chiefly from widows and orphans whose property is laid before the assessors in the probate courts, where concealment from the State is impossible. There must be a practicable remedy for this flagrant injustice; what is it?

BREVITIES.

"I AM a farmer because then I can always know where my home is, and am never out of a job." Thus writes a subscriber in Steele City, Neb.

ONE of our correspondents in this week's issue, says he prefers Silver-hull to the Japanese Buckwheat—the first disparaging remark we have heard respecting the latter.

WE have been covering the ground of two of our chicken yards with pine "needles" about six inches deep. These keep the chickens' feet warm and dry. The grain (corn and wheat), is scattered upon this covering, and the birds are obliged to scratch for their food.

GO TO the woods and cut sticks from one to four feet high. Any kind of wood will answer. Shave off one end and paint it with white lead and turpentine—no oil. Sharpen the other end. You will have a label stake that can be used for at least two years, at a trifling cost.

IT is the R. N.-Y.'s belief that it is during such "open" winters as the present that grapevines, strawberry and raspberry plants usually sustain the severest injury. Heaving of the soil can not occur when frozen, and a uniformly cold winter will therefore leave the roots intact. But the soil is saturated with water, and alternations of frost and thaw occur during almost every 24 hours. Mulching is the only protection against this.

A subscriber in Maryland calls attention to an important matter as follows:

"Can't something be done to stir up the farmers of the country to prepare for the census of 1890? The agricultural reports of the census are of little value because they consist largely of averages made up by the census-takers, and not of actual facts reported by the farmers. The farmers don't know the facts and the census man puts down what he thinks the facts ought to be."

How many farmers can put a just valuation on their property? This matter may well be investigated.

HELP.

(*Continued from page* 52.)

A WOMAN'S OPINION.

Farmers labor under peculiar difficulties in employing help. In the first place, no standard of skill, experience or character is required, the reverse of the custom in employing operatives in any other business. This necessitates untiring patience and constant vigilance on the part of the employer. Even then there are often waste and ruin of materials, implements and time, through ignorance, aud indifference; but the wages still go on. In the next place, the best interests of our business and our families seem to conflict in employing ignorant—(not necessarily as regards general intelligence but in respect to labor,) and often uncouth and unprincipled strangers. Farmers just beginning in life, and those of moderate means, not having tenant houses, are obliged to take these men and boys into their families, in a measure. The degree of familiarity, or privileges granted them is a problem that vitally concerns us and our children, affecting us physically, financially, and intellectually. If the same help remained year after year, we might hope to benefit them in all these respects; but they do not, and the majority have no appreciation of such benefits, or ambition in these directions. The natural consequence to ourselves is that our own efforts and aspirations are relaxed, and our children are in a way constantly to imbibe ideas and manners that are pernicious. Of less importance possibly, but more trying to our nerves and tempers, are the noises, annoyances and indignities we suffer daily from these men, (often unclean foreigners,) if they eat at our table. Even if it were possible to make them comprehend the usefulness, the healthfulness, the luxury of cleanliness of body and garments and boots, the nature of their work would often render their presence obnoxious to people of refined sensibilities. I realize that this is unavoidable, but is it unavoidable that we should lower our standard? What are we really living for? Then the food and appointments of a table for such laborers are entirely different from those relished and needed by members of the family. More than this, the farmer ought to have the delightful privilege of seclusion with his own, around the frugal board, three short half-hours a day, that each may speak freely of all in his heart, direct conversation into a higher plane, and not fear having his private affairs circulated as stupid ears or an evil tongue might construe them.

On the other hand, we must consider the well-being and the feelings of our help. Their labor is exhausting; they need abundant and nourishing food, served with regularity, and promptness; they should not be required to eat after the family; if anything, their meals should be earlier in the day; but circumstances vary greatly. Some keep but one man, their accommodations are limited, there's no maid to help, and time and labor must be rigidly economized, so all must eat together. Even then too great familiarity with help at the noon and evening hours should be avoided. Granting them unusual favors makes them exacting and presuming. It is difficult to guard the children from this without exciting the suspicion and animosity of the help. A wise and righteous course is to insist as one of the rights and privileges of our help, that they be left to the enjoyment of seclusion with themselves and their friends who come to see them. We should be conscientiously kind and honest with them, and give them true ideas of the duties, responsibilities and real pleasures of life. We should teach them how to work and make them feel the satisfaction and pride afforded by doing work skillfully and honestly, and that it usually results in a saving of time, strength and material, thus teaching them to think and reason out cause and effect. This is more feasible with indoor help, providing they have any natural intelligence, but we must not be surprised if we see no immediate results. Usually the only compensation to us is the consciousness of having done a little home missionary work on our own territory

MRS. I. D. C.

FROM WASHINGTON TERRITORY.

We get our help mostly from the Western Atlantic States. Swedes and Americans predominate, but there are rather more Swedes on the farm, as Americans and Irish take more to the logging camp, as they can get better wages in the woods, and, as a general thing, Americans from the West are good axemen. The Swedes are very saving and take good care of their money. I should say two-thirds of them are farming for themselves in three or four years. The Americans are more inclined after they have earned a few hundred dollars, to start a logging camp, or a country store in a new settlement.

The farmers usually get hands by sending to the employment bureaus in our largest cities, such as Seattle or Tacoma, at the termini of railroad and steam-boat travel. The wages for a good farm hand are $300 per year, with board and washing. No contracts are signed. We agree to pay $30 per month for summer, and $20 for winter work—six months of each. The agreements can be broken at the pleasure of either party on a week's notice.

In the morning, chores are done, breakfast eaten, teams harnessed ready for work, by seven o'clock. At six in the evening we quit work; the teams are then taken care of, and chores are done for the night. On Sundays the men must do the chores morning and night. The hired man is mostly treated as one of the family. We don't forget that we were hired men ourselves once.

We hire good men every time, even at an advance of $5.00 per month; for a poor, blundering, careless man will lose every year more than would pay for a good man, through mistakes and carelessness in leaving gates open and fences down, and also tools out in the rain and sun to rust and warp. Moreover, the employer must be with a poor man all the time, to see that he does his work properly, or something is sure to go wrong. Our cities are not crowded as are those in the East, so that the boys all find work at home if they are willing to work at all. I find that farmers in this part of the country, if they get a good man, try to use him so kindly that he will stay as long as he cares to hire out.

I know plenty of farmers who have had the same men for four and five years. They are treated as members of the family, and don't care to change about. H. A. MARCH.

Miscellaneous.

CORRESPONDENTS' VIEWS.

SIDE-WALKS AND SHADE TREES.—I was asked the other day why the shade trees in certain streets and fashionable avenues seemed to languish in growth and present a sickly, stunted appearance. I pointed to the hard, smooth asphalt pavement which covered the roadway from curb to curb, and asked my friend how he supposed any water or moisture could get through that air-tight surface. He had never thought of that, and the suggestion only recently came to me. It cannot be possible that trees so placed can receive the moisture and nourishment requsite for thrift and vigor, and it is really surprising that they live at all for any length of time, especially where the sidewalk is also covered with the impervious asphalt, as it often is. The roots must go down very deep. Of course, the soil in such places is very retentive of moisture, not being subject to the evaporation common to unsealed surfaces. But in prolonged droughts lack of water is inevitable. Might not some practical plan be devised to obviate this difficulty in part? A capacious cavity about the tree to receive surplus water, gratings at intervals near the curb, or a line of gratings there would answer the purpose. We can't well do without the trees. We want them to feel comfortable and look vigorous, and yet we don't want to give up this excellent and beautiful form of pavement where it will staud. It is so smooth, clean and elastic, such a saver of friction, noise, horse-flesh, wear and tear of vehicles, time and temper—almost everything is in its favor. How many have thought about the welfare of our street trees? H. H.

IT WAS MY INTENTION to have sent the RURAL specimens of some of my seedling grapes this season, but they were cut off by a very severe hail-storm in May, which caused a delay of about two weeks, until a new growth from the latent or secondary buds took place, with but few small clusters of fruit. My vines have made a very strong, vigorous growth of well-ripened wood, giving promise of a good crop next season, and I hope to be able to send the RURAL a number of varieties, some of which prove superior to any others grown here or known to me. I am much pleased with the Minnehaha grape after four years' fruiting. It is a very strong, vigorous and healthy vine, very prolific of delicious fruit. It showed a little mildew this season, but not enough to prevent the fruit from ripening up well, it having escaped being cut off by the hail. I have seen no notice of it except in the RURAL some two years since. The vine is three-quarters Vinifera and appears to be as hardy as any of the hybrids. I am in hopes of being able to say something favorable of a four-year-old vine, a seedling from a Flame Tokay grape, the seed being from fruit grown in California. Four branches have grown from it this season, one 12, one 15, and two 18 feet each. They are mostly well-ripened wood as thick as my finger, and very short-jointed. I think it wonderful. JOHN BURR.

WHY I AM A FARMER.—As the RURAL desires its subscribers to tell why they are farmers, I may as well tell my reasons now. There seems to have been a love for farming born with me. I was not reared on a farm, but always desired to possess one, not for the money to be made upon it, for in the matter of dollars and cents farming can not be called a success; but I wanted to be a farmer to obtain independence, health, time for mental culture and enjoyment of nature in all her changes, and for these purposes a life upon the farm cannot be excelled. There are many unpleasant things connected with farming, but it seems to me to be man's most natural occupation. Having an intense love for fruits and flowers, I can indulge in them to my heart's content. The time and money required for a beautiful lawn and garden are trifling, compared with what is wasted loafing at the store. Farming is my ideal life, therefore, I am a farmer. E. Y. LYON.

Essex Co., N. Y.

When I first saw the RURAL NEW-YORKER in '85, I thought it was devoted to agriculture for a more southern latitude than this; but I find that there are good articles in it for farmers as far north as Maine, besides a large amount of practical and instructive teaching on farm matters with which climate has little to do. I like the way the paper is taking up the nomination for Commissioner of Agriculture. If all the agricultural papers would work up the subject and get at the wishes of the farmers, possibly a man might be nominated who would use his office to secure the greatest good to the greatest number of farmers. It certainly seems as though there was room for some improvement on what we have had in times past. If President Harrison does not give us a good man, why, let us work all the harder next time. F. WM. H.

Warren, Maine.

I have been a subscriber for the RURAL for a number of years, and I must say that the longer I know it the better I like it. There has been no number during the past year which did not contain information that saved me more than two dollars. I could not estimate in dollars, what the Eye-Opener has saved me in being no longer pestered by sharks and sharpers. My front gate seems to be marked with some private mark known to sharpers, which must mean, "Beware of the Eye-Opener." DANIEL FOLEY.

St. Clair Co., Mich.

I VISITED THE FARM of a prominent market gardener near here recently, and had occasion to notice the manner in which his stock of 15,000 cabbages were buried for protection during winter, while easily accessible. They had been placed roots upward, in twos, in parallel rows in the field where they had grown. A furrow of earth was turned with a plow on either side of them, completely covering the heads. The owner assured me that they kept splendidly and that none but the outside leaves were injured by freezing and thawing. This plan certainly saves much labor, and it is not necessary to uncover the whole supply to obtain a few heads. W. T.

Dover, Del.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

THE "Kindly Club" is an organization devoted to the virtues expressed by its name. It originated in the busy brain of Mrs. Janet Runtz-Rees, a literary woman of English birth. To quote from a leaflet sent out by Mrs. Runtz-Rees, the object of the club is the cultivation of kindly thoughts by kindly words and by the suppression of "evil speaking, lying, and slandering."

To be a member it is only necessary to sign the form of membership, and to strive to cultivate kindliness of thought and word, to resolve never to repeat derogatory or ill-natured remarks of another, never to belittle any one, never to speak unkindly gossip or scandal.

* * *

THE badge of this society is an inexpensive pin with the design of a bridle bearing as motto "The Law of Kindliness," or a violet button. The price of the pin is 50 cents, and of the button 10 cents. Badges and circulars may be obtained from the Secretary, 19 East Sixteenth St., New York. The society holds monthly meetings, and also gives kindly talks from time to time. Branches are being formed in different places, like the King's Daughters' Tens. Even without formally joining a club, can't we all be members of this society? It does seem the hardest thing in the world to bridle the tongue, the last lesson so many of us are able to learn. Any one of us, in looking back over the worries and disagreements of a single year, will find that half of them, at least, would have been soothed and softened by a kindly tongue.

* * *

WHILE speaking of this society, a quotation from the "Home-Maker" is very appropriate.

"Do not say a rough word when a smooth one will serve your purpose as well. Before indulging in retort, or sly thrust, or "crusher"—whatever the provocation—ask yourself, 'Would I wish this unsaid if I were never to behold his living face again?' "Common sense ought to have proved to us by this time that oil is a better lubricant of household machinery than vinegar or caustic."

* * *

A PRETTY picture frame for a marine view is described in the Home-Maker. It consists of a plain pine frame, roughened by sticking an awl in a little way, and then turning it. This is done all over. Around the inner edge of the frame is a mat made of braided twine, the braid being three-quarters of an inch wide. Over the two upper corners a piece of fine twine netting is placed, making a three cornered cover on each. On each lower corner a small starfish is glued. When these decorations are secured the whole thing should receive two coats of silver paint.

* * *

THE same paper describes a charming door decoration. It was an unused door, and an ugly one to boot. First a small shelf was put over it. On this were a few pieces of china. The door itself was covered with plain maroon velveteen stretched from top to bottom without any fullness. Over the velveteen, across the top and down the sides, were a pair of thin Syrian curtains, gracefully draped. Half way down was fastened a small bracket; above this were tacked some engravings without frames, the velveteen making an excellent back-ground. At the base was a large jar filled with bulrushes, cat-tails, and long grasses. This makes a charming bit of decoration.

HOME DUTY.

J. H. G.

IN these days, when so much of our population is concentrated in cities and large towns; when our habits of living are almost communistic in character; when individual and isolated home-life is almost unknown, our public duties demand a large and ever-increasing share of our time and attention. It is at times exceedingly difficult to determine where our private duties end and our public duties begin, and we are too apt to let personal ease or pleasure determine our action. With very many people, public duty has a fascination which seems almost irresistible. With men it is usually politics, clubs, or secret societies which furnish the excuse for the neglect of the home; with women it is usually sewing societies, church sociables, Chautauqua meetings and the like, which cause the neglect of home duties. It is a very common thing to see children roaming the streets in rags and dirt, while the mother is at a meeting of the sewing society and the father at the village store talking politics. A recent number of the Christian Union contains a story which illustrates our duty in a very entertaining way. It is in the form of an imaginary discussion at a church meeting. The Parson, as usual, would measure the piety of his parishioners by their regular attendance at the various church meetings; the Deacon differs from him.

"But I can't agree with you, Deacon," said the Parson, "in your saying that the home is more sacred than the church. God founded the church in the wilderness."

"And God founded the family in the garden," said the Deacon.

"Christ died for the church on the cross," said the Parson.

"And Christ was born into the family in the manger," said the Deacon.

"God will at last present the church a perfect church, without spot or wrinkle, or any such thing," said the Parson.

"When we all come home," said the Deacon, "to join the great family of redeemed in the household of faith around our Father which is in heaven."

"But, Deacon," said Mrs. Geer, the Parson's wife, "suppose everybody stayed at home and took care of her own children, what would become of the church?"

"And suppose everybody goes off to church," replied the Deacon, "what's to become of the children at home?"

"There must be a golden mean, I suppose," said Mrs. Geer.

"No!" said the Deacon; "there is no golden mean. Means are not golden. They're brass, or lead, or pewter. Every man's first duty is to his own home. He ought to invest his first money there, and put his first energies there, and concentrate his first thoughts there, and give his first time there. Then, if he has any left, let him give it to the church."

The Parson shook his head.

"Parson," said the Deacon, energetically, "didn't you think Mr. Wheaton did a good thing last year when he undertook to pay the expenses of young Whitcomb through college and the theological seminary?"

"Yes," said the Parson; "I certainly did."

"But here's Mr. Hardcap," continued the Deacon, "who is not only paying for the schooling, but for the food, and clothing, and shelter, all the expenses of four or five boys and girls, and that not for five or six or seven years—he has assumed the cost of each of them for fifteen years or so."

It was a sight to behold—the expression on Mr. Hardcap's face at this unexpected discovery of his before unsuspected beneficence.

"But they're his own children," said the Parson.

"Certainly," said the Deacon; "what of that? Somebody's got to take care of them. And I should like somebody to tell me why it is not just as benevolent for Mr. Hardcap to take care of his own as for Mr. Wheaton to take care of somebody else's child; and why it does not do just as much good."

"I never thought of it in that way before," said the Parson.

"You may depend upon it, it is the right way," said the Deacon. "God has given every man his children to take care of—to feed, to clothe, to house, to educate. If we all did our duty, there would be no need of philanthropic charity. That's God's way of taking care of everybody. The man who neglects his own children to take care of somebody else's children starts all wrong. The father and mother who have reared, cared for, educated and put into life well endowed for life's work half a dozen children, have done a good life work, if they never do anything else. That's the main thing: anything else they may do is extra, be it little or much."

BORROWING.

"Neither a borrower nor a lender be,
For loan oft loses both itself and friend."

THUS wrote the Bard of Avon, and I have found it true that the 'loan oft loses itself,' sighed I, as I sent Timothy out to make a circuit of the neighborhood in search of my quilting-frame, which I had lent last spring to Mrs. Brown, who had lent it to a neighbor, who had in turn lent it, and so on. I have always been free to lend, and Timothy says he spends most of his time in hunting up the articles from the borrowers who make a point, it seems, never to return anything. I was as willing to borrow as to lend until my mother-in-law, of blessed memory, came to make me a visit a few years after my marriage. Seeing me about to send Norah to a neighbor's for some sugar, she asked me how far it was to the store. "Five minutes' walk," said I. "Then," said the old lady, "why not send and buy it at once, since you must eventually do this, as well as make two trips to your neighbor's house?" After that, when I had the impulse to borrow, I studied the matter first to see how really necessary the borrowing was, and I found that in nine cases out of ten it was easier and better to do without, or substitute something else for the required article, and that a little carefulness and restraint here helped me wonderfully in remembering to keep certain supplies on hand.

Still, although I have learned not to borrow, and find borrowers a nuisance, I have not the courage to refuse to lend. When the Browns send their little boy in for next week's RURAL I shall lend it, although I know that it will either not be returned at all, or that when it comes back it will be soiled, dog-eared, and ragged. If they will read this, and if it sets them thinking, I shall be repaid, although I shall have to order another copy of the paper to keep my file entire.

MRS. TIMOTHY HAYSEED.

INDOORS AND OUT.

EXCEPTION has been taken to the cartoon in the Thanksgiving Number of the RURAL because the woman is placed two or three steps lower than the man and on a level with the animals. The critics evidently forget that it is an out-of-door scene. It is in a place where the man should lead and govern. In the subsequent banquet in the spacious dining-room, the farmer's wife presides and leads the welcome music of the tea-kettle with an accompaniment of delicious perfumes from the well roasted turkey and hot mince pies. Here the *man* very properly gives way to the woman and she reigns supreme.

Why is it that so many women are "always and eternally" dissatisfied with their position in life? Every one knows that all institutions, including the smallest family, must have a head. It is ordained of God that man shall be at the head of the family and no earthly power can change the divine decree. The only result of dissatisfaction and carping criticism, is the injury of the family and the home: the institutions which lie at the very foundations of our national structure. The highest type of womanhood is that of the wife and mother and as such she must be subordinate to man out-of-doors.

GOLDEN GRAINS.

MOODY says that there is something better than a revival, and that is a Christian that does not need to be revived ...

THE Rev. Dr. Denner says if we are going to apply the doctrine of averages to our Christian life, let us make it a high one. Let us not use our extra piety of the Sabbath to fill the ungodly holes and gaps in our conduct on other days. What we have done will never level up what we have left undone.....

THIS sentence from Herbert Spencer is as good religion as it is politics: The man who plumes himself upon his wisdom in minding his own business, is blind to the fact that his own business is made possible only by maintaining a healthy state .....

KATE L. BROWN thinks it is a good thing to fall sometimes. It has the effect of an electrical shock, starting the life currents into new activities. But let us take care that these falls be "falls upward," and that new grace and wisdom are fruits thereof.....

BENEFICENCE is a running stream, says Dr. Edwards. If cash flows out of a Christian man's pocket, it will almost miraculously flow in again, just as water rushes into a channel whose waters have to gush out. Many a good man's purse is like a syphon, the very emptying of which insures its refilling.....

A WRITER in the Philadelphia Ledger says it is useless to talk of sacrificing self to others unless there is something in self that others need. It is the full and rich life, not the poor and empty one, that can fill and enrich others. True benevolence, then, must obtain that which it would give. To acquire honorably money or leisure or power, to cultivate health and happiness, to gain knowledge and wisdom, to develop interest in human affairs, to cherish just principles and generous impulses, to fill the mind with pure and noble thoughts and the heart with tender love and sympathy—these things are essential if we would pour out blessings and benefits upon our fellow-men, while at the same time they ennoble and gladden our own lives. We are all influencing others in the direction in which we ourselves are tending.....

RUSKIN said that childhood often holds a truth with its feeble fingers, which the grasp of manhood cannot retain, which it is the pride of utmost age to recover.....

THE one prudence in life is concentration, the one evil is dissipation, and it makes no difference whether our dissipations are coarse or fine—property and its cares, friends and a social habit, or politics, or music, or feasting.

KEEP THIS FACT IN VIEW.—Thatcher's Orange Butter Color is to-day the strongest, cheapest and most natural color in the world and can be found with nearly every dealer throughout the dairy belt of U. S. Thatcher M'f'g. Co., Potsdam, N. Y.—*Adv.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

He who bestows nothing, receives nothing; he who sows not, reaps not, and he who bears not the burdens of others, is usually crushed under his own.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

FOR the enlightenment of our new subscribers, we will again state that the extracts under this heading are taken from essays or talks read or given extemporaneously, at what we call our Sunday evening devotional exercise, by the different members of the Rural circle, who, as our old readers know, live in a lonely country place and some distance from a church. These exercises consist of Bible reading, discussion of the matter read, reading and explanation of the International Sunday-school Lesson, reading of the paper prepared by a previously appointed member, and singing, ending with repetition in concert of the Lord's Prayer.

Our readers will kindly consider that our extracts are taken alike from young and old. While we intend to quote from time to time from these talks, many of them are of too personal a character to allow of so doing. As a matter of course, the RURAL NEW-YORKER does not hold itself responsible for the principles advocated or denounced in these talks.

"INASMUCH as ye have done it unto one of the least of these my brethren, ye have done it unto me." MATTHEW, 25:40.

It occurred to me some time ago, that my next production for our Sunday evening services should be based upon an incident of my life, which has influenced me probably more than any other one thing. I know of no more appropriate text than the one I have read.

The summer I was 16 years old was the happiest, in the sense of freedom from care, within my remembrance. Yet toward the close of that summer I was guilty of the act to which I have referred. One night during the last week in August, I attended a party or "sociable," as such meetings are sometimes called. Having returned home at a late hour, I was tired and sleepy. It seemed as though I had just gone to sleep, when I was awakened by my little brother who shared my room, and was always my especial favorite.

"Sister, I am *so* thirsty, I want a drink of water."

Half asleep I went to the water-pitcher, but found it *empty*. I said to him:

"There isn't any water up here; you'll soon go to sleep," thus summarily dismissing the subject from my mind, believing that his thirst would soon be forgotten and he soundly asleep. The next thing of which I was conscious was of hearing the following conversation.

"Mamma, are you awake?"

"Yes, dear; what is it?" said the mother, springing out of bed, and running to the stairs where the little fellow stood, half-way down. (The mother's room was on the first floor).

"Will you give me a drink of water, please?"

You may be sure that the little boy had not long to wait for his drink *then*.

"Why didn't you tell sister?"

"I did; but there wasn't any water upstairs, and sister was so tired and sleepy. Thank you, mamma. Good-night."

"Good-night, little boy; be careful, don't fall!" (The hall was very dark.) I heard the little fellow patter up the stairs and across the floor. He climbed into bed, and nestling close up to me, I heard him say:

"Poor sister, so tired and sleepy!"

Can you imagine my feelings? *No.* I don't believe any one can know how I hated myself. For hours I lay there unable to close my eyes in sleep. "Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me," came to my mind time and again. Also this passage from St. James, in which it seemed to me that "*love*" should be substituted for "*faith.*" "What doth it profit, my brethren, though a man say he hath faith and have not works? Can faith save him? Faith, if it hath not works, is dead.

Yea, a man may say, Thou hast faith and I have works: shew me thy faith without thy works, and I will shew thee my faith by my works." Surely my *faith*, my *love* were "without works." There was "my own little boy" (as I called him), whom I loved with all the love of which I was capable, yet self-indulgence had come before that love.

That lesson taught me what I fear I should never have learned otherwise, and it has since seemed as though I "did evil that good might come."

It made me considerate to an extreme degree, I believe, of a child's or of children's wants—even notions. I can say, with all truth, that never since has a child's appeal, request, or desire been unheeded by me. Not that I gratify every little whim, for I know that children are apt to have a great many, which, if indulged would result in material injury to both body and character. I mean that I give it a reasoning thought and act accordingly. I feel that I would make any personal sacrifice, or undergo any hardship in order to grant a child's request, or to save a child from disappointment.

The *divine* in my text appeals not to me so much as the *human*. That is not the true significance and application I know, but how can we reach the *divine* but through the *human?*

All right-minded people will, I think, agree with me that education and morality alone should be the levelers, so to speak, as to social equality, and that they alone should decide whether a person be your equal or your inferior, or whether he be a suitable person to introduce into your home or one whom it would be better to avoid. Now, I do not wish to be misunderstood as not attaching importance to what is called "blue blood," or "good family," for such is not the case; but what I wish to assert is that if a person is morally and intellectually your equal, he *is* your equal, notwithstanding the fact that his mother takes in washing or that his father drives a cab. What is the difference between servant and master, maid and mistress? What draws the line and where is it to be drawn? Morally I have known girls superior to their mistresses, and I have known some maids and mistresses of such a character that, were their positions changed, each would have been better fitted for the situation.

If your girl is as refined as you are and morally your equal, then she should be treated as your equal—she is not your servant, neither will she long occupy a servant's position.

Associations, lack of education, refinement and often a dulled or warped moral sense, these are the inheritances that compel your servant to occupy a lower place than you grace or disgrace; these the inheritances that draw the line. God forbid that I should feel that any human being was beneath me, but because I feel thus, is it any reason why I wish to eat with my man or maid servant? Is it any reason why I should wish to talk over my private affairs with Peter or Jane, or to be "hail fellow well met" with them? * * Caste nowhere shows its disreputable side so well as in the so-called fashionable society of our times. It is held together not by any high grade of intelligence, not by any moral principles. A love of display and the gratification which springs from the adulation which wealth inspires are the lodestones that hold it together and make it what it is. It is a life, senseless, aimless and worthless, if viewed from an elevated point of view. Fashionable people give to intellect and morality a secondary place; refinement they assume to manufacture for themselves. * * * It has often occurred to me that the class of human beings, known as the nobility, will experience an altogether novel sensation in the world beyond, where rank and precedence dissolve before the just but inexorable judgment of Him who hath said: "For he that is least among you all, the same shall be great," and again, "Many that are first shall be last and the last shall be first."

But the great question that concerns us individually, my friends, is whether we be first or last when judged by the Eye which knoweth the innermost secrets of the heart.

NOT long since I read an interesting little book entitled "A Child's Influence" which made a deep impression upon me. How many of us stop to consider the meaning of the word influence, and how few of us realize that in our every day life we are exerting an influence either for good or bad? Are we letting our light shine as it should? A thoughtless, unintentional act on our part may be the means of leading some one astray. It is well to realize this.

A WORD TO CHARITY SWEETHEART.

A MOST estimable lady of my acquaintance made it a regular practice to air her domestic grievances every time she attended the class-meetings of her church, and while it may have been edifying to her own mind, it was rather rough on her auditors. So, Charity seems to think it a duty to tell the RURAL readers all about her own tribulations. If this would have any good effect, the dear soul would be justfied in publishing abroad her troubles; but in the present case she seems to be somewhat afflicted by that dread disease—*cacœthes scribendi.* Charity would have had her father to go behind the barn for

When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

his pig-killing, and prevent "that unnecessary blot on her housewifely pride." Well, it might have been best; but my father brought home a lot of fish, which my step-mother refused to have cleaned in the kitchen. He did the work away from the house and in the rain. Within a few days my step-mother was a widow; but she maintained her reputation for neat housekeeping. Charity's father *might* have spared her "that unnecessary blot," and he might have become wet and chilled, and a victim of pneumonia. But "that blot" seemed to have been of more consequence than the well-being of father, brothers, and hired men, "who have no more brains than so many calves." Judging from Charity's complaint, she must have had chances of attending some school where she could learn "to paint little things for Christmas," and probably acquire other accomplishments, and become so refined that her father, brothers and neighbors appear to be "boors" in her sight. Such is the way of the world! Farmers' daughters are sent off to school to become "refined and accomplished," while they associate with intelligent people. The boys usually stay at home to toil for the "refining" of their sisters. Working 16 hours out of every 24, side by side with ignorant and vicious hired men, they have small chance of choosing their associates and consequently lack the polish of the drawing-room, yet "those whom they profess to love" will often, as in the case of Charity Sweetheart, if they can get an audience, proclaim to the world the shortcomings of the "boors," instead of endeavoring to imbue them with a little of that culture and refinement so persistently held forth to the view of a long-suffering public. I have a daughter whom, if she is spared to me, I will endeavor to have educated in such a manner that she will not hold up to public ridicule her less cultured father and mother and brothers, after the manner of Charity Sweetheart, whose name, by the way, is a gross misnomer.

A MAN.

COOKING MUSHROOMS.

MRS. WILLIAM FALCONER.

IF you raise your own mushrooms, you can gather them when you please, and cook them as you please, and enjoy them in their most delightful condition. Bought mushrooms are a very great luxury, for they cost $1.50 a pound, and are often poor enough at that. Canned mushrooms are immensely inferior to freshly-gathered ones. The small, short-stemmed, white-skinned mushrooms offered for sale in the leading fruiterers' stores, are of the variety known as French mushrooms; the larger, longer-stemmed, broader-headed and darker-colored kind that we also find offered for sale, is what is known as the English mushroom. The French mushrooms are preferred in market, but the English variety is the best-flavored, and by far the best for home use.

But as we grow our own mushrooms, and have had them in quantity since the first of November, I will confine myself to these.

Mushrooms should be gathered when they are full grown, but either before the frill around the neck bursts open, or within a day after it opens. Over-young mushrooms are somewhat tasteless, and those that are too old are tough. In gathering mushrooms do not cut them off, but pull them up by the roots; in this way they keep fresh much longer than they would do were they cut. As soon as gathered, cover them over with paper or cloth and keep them in a cool place to preserve them plump and fresh and white. Rough handling, crushing or jarring bruises and discolors them.

The broad head or cap of the mushroom is the part mostly used, but the top or succulent part of the stem is also good to eat, although not so well flavored as is the cap. But any part of the stem that is woody, soggy, tough or discolored is unfit for use. In preparing mushrooms for cooking always peel the skin off the top of the cap, but don't remove the gills or underside, and also break out the stem; the stems part easily from the caps. We do not peel the stems and seldom cook them together with the caps; they are mostly sliced thin and cooked separately. The bottom part of the stems should be thrown away.

Mushrooms that have wilted by age or exposure before being cooked, will be tough; undergrown young mushrooms, though not exactly tough, will be almost as tasteless as putty; mushrooms that are too old will be tough and black when cooked; mushrooms that are undercooked will be tough; so will those that are overdone, and those that are allowed to get cold before they are eaten.

Now, before cooking mushrooms, decide upon the minute when you wish to eat them, because of all vegetables mushrooms are the ones that must be eaten hot and just as soon as they are cooked; that is, if one wishes to enjoy their delicious aroma. And always serve them on hot dishes.

BAKED MUSHROOMS.—Peel and stem the mushrooms, rub and sprinkle a little salt on the gills, and lay the mushrooms, gills up, on a shallow baking tin. Place an inverted saucer or deep plate over them in the tin, and put them into a brisk oven for about 15 minutes. Then take them out, and dish them up on a hot plate, without spilling the juice that has collected in the middle of each mushroom. Send to table and eat at once. This is the commonest, and, in fact, everybody's way of cooking mushrooms, and by it we secure the true mushroom aroma and taste in their finest perfection.

STEWED MUSHROOMS.—Peel and stem the mushrooms. Take an enameled sauce-pan, put a lump of butter in it and melt it, then put in the mushrooms, and season with salt and pepper, a small piece of pounded mace (if you like it), then cover the sauce-pan tightly, and stew the mushrooms gently until they are tender, which will be in about half an hour. Have ready some toast, either dry or fried in butter, as you like it best, spread out on a hot dish, then dish out the mushrooms on to the toast, keeping them gills side up, and pour the juice over them. Serve and eat hot.

MUSHROOMS À LA CRÊME.—Peel and stem the mushrooms, roll a lump of butter in flour and put it into the sauce-pan, then put in the mushrooms, and some salt, white pepper, a little sugar and some finely chopped parsley. Stew for ten minutes, then take the yelks of two eggs, beaten up with two large spoonfuls of cream, and add the mixture gradually to the stew; cook for about a couple of minutes longer, then serve in hot dishes. This is a delicious dish, but the fine mushroom flavor is not as pronounced in it as it is in the plain bake or stew.

CURRIED MUSHROOMS.—Peel and stem about 20 mushrooms, sprinkle with salt, add a little butter, and stew gently in a little good gravy or stock. Add four table-spoonfuls of cream and one tea-spoonful of good curry powder, previously well mixed, with two tea-spoonfuls of wheat flour. Mix carefully and serve on a hot dish with hot toast. A capital dish, and enjoyed by those who like curry.

SOYER'S BREAKFAST MUSHROOMS.—Place some freshly made toast, divided, on a dish, and put the mushrooms, stemmed and peeled, and gills up upon it; add a little pepper and salt, and put a small bit of butter in the middle of each mushroom. Then pour a tea-spoonful of cream over each, and add one clove for the whole dish. Put an inverted basin over the whole. Bake for 20 minutes, then bring to the table hot, and do not remove the basin till the dish is brought to the table, so as to preserve the grateful aroma. A most delightful dish.

MUSHROOM SOUP.—Take a good quality of mushrooms, peel and stem them. Stew them with a little butter, pepper and salt, and some good stock still tender; take them out and chop them up quite small, prepare a good stock as for any other soup, and add it to the mushrooms and the liquor they have been stewed in. Boil all together, and serve. If white soup is required, use white button mushrooms and a good veal stock, adding a spoonful of cream or a little milk as the color may require. This is a nice soup and tastes well. But it always seems to me a pity to cut up good mushrooms. If the mushrooms are very young, they have but little flavor; if they are full grown, they darken the soup, and if they are a little brown in the gills at the time when they are used, the soup will be disagreeably black. If after preparing but before cooking the mushrooms, you pour some boiling water over them and into this drop a little vinegar or lemon juice, and then drain them off through a colander you can prevent, to a great extent their darkening influence on the soup, but always at the expense of their flavor.

HERE AND THERE.

THE RURAL seems to be better than ever this week, (Jan 12.) there are so many items which call forth responses from many a heart.

After perusing "Reader's" remarks on training up children to take an interest in their parents' business, can any one wonder that boys who have been treated in that shabby way wish to leave the farm? Yet I know the picture is not overdrawn, as I have heard of similiar cases, and have thought such fathers worse than the old-time slave masters, at the South; for, as a general thing, whatever a slave might earn by extra work or accumulate by the generosity of visitors, was his own, and he was at liberty to spend it as he chose.

I would ask such parents. "Are your own children yours, soul and body, until they are 21 years of age?" I don't think God so intended, and I do not wonder that a son should rebel against such treatment, and seek different employment and strange masters.

How I wish I were yet living in the country, and could join in the "Ladies' Potato Contest." I would enjoy it without the hope of a prize, for I dearly love to work amongst flowers and vegetables.

A nice way to cool mush you wish to fry next morning, is to rinse an empty baking powder can or cans, in cold water, and fill them with the warm mush. When it is cold, turn it out and cut in slices; hot mush dropped on a well greased, hot griddle is excellent.

Minnie Grey's "mission" is indeed a blessed one, and though the world at large may never hear of her, those little ones she is now so kindly helping, will in after years "rise up and call her blessed." I have often wondered why it is that those who need to understand sewing most (the very poor) are so often entirely ignorant of it. Speed the day when we shall have more sewing and cooking schools!

EMMA D W.

BREAD; ANOTHER METHOD.

THE easiest and best method of bread making, that I know of, is to let the baker make it, and if you buy yesterday's bread at four cents per loaf, it is neither very expensive nor very dry, and is far more wholesome than fresh bread. When I make bread myself, however, this is the way I do it:—I sift warmed flour, with a pinch of salt, in a deep bowl, and use half a cake of compressed yeast or half a cup of liquid yeast for two loaves. I mix at night with warm water, using only enough to permit kneading at once I work it again in the morning once—or twice if desired—and let it rise till it is light, and bake rather quickly. I think the success of bread-making depends much more on the liveliness of the yeast than on any other one thing.

RENA ROSS.

QUEEN'S PUDDING.

"WHAT a delicious pudding," thought I, as I tasted of the dessert at my friend's dinner-table on New Year's Day. After the feast was over and all things were in apple-pie order, and we were ready to visit in a good old-fashioned way, I thought of "our" RURAL'S Domestic Department, and asked how that pudding was made. Said Mrs. S., "I take about a quart of good, rich, sweet milk, and, I think, half a pint of bread crumbs, *minus* the crust. Milk and bread are scalded together, and cooled enough to work through the colander. This I do with my hands. In this way the bread is worked smooth, and is thoroughly mixed with the milk. To this mixture are added the yelks of four eggs and the whites of two, about two-thirds of a cup of sugar, and one spoonful of butter. I beat the ingredients together very thoroughly, for the success of the pudding depends much on the beating. I flavor with nutmeg. I bake it in a very moderately hot oven, much as I would a custard pie, which, you know, should never come to a boil.

When baked, beat the whites of the two eggs to a stiff froth and add three or four spoonfuls of granulated sugar for the frosting. Spread a good layer of jelly upon the pudding, and over this spread the frosting, and set in the oven till it browns, which takes but a very few minutes if the oven is hot. To be eaten with cream and sugar."

It was only a bread pudding after all, and yet there was not a trace of bread visible to the eye, nor could the tongue detect a single crumb.

News of the Week.

HOME NEWS.

SATURDAY, January 19, 1889.

LAST Monday the various electoral colleges, consisting of the Presidential electors chosen on November 6, met at the capitals of their respective States, as provided in the United States Constitution, and cast their votes for President and Vice-President. Altogether 401 votes were cast. Of these Harrison got 223 and Cleveland 168—a majority of 65 for the former. As a matter of interesting record and condensation the following table briefly shows the results of the recent election.....

	Popular Vote.				Electoral Vote.

Total vote of the four leading parties, 11,353,061. Cleveland's plurality, 96,499.

A bill has been introduced into the Lower House of Congress by Representative Funston authorizing the Commissioner of Agriculture to establish and maintain at some central point a station for experimenting in the manufacture of sugar from beets, sorghum or cane. The Commissioner is authorized to receive at such station for education in sugar-making processes students who will agree to continue in the busines three years after they leave the station. Each State will be entitled to send two students to such station, and the Territories and District of Columbia, one each. For the purposes set forth in the bill, $100,000 are appropriated, together with all unexpended balances of appropriations made for sugar experiments..... The total number of murders committed in the country, as reported to the Chicago Tribune, during 1888, is 2,184, as compared with 2,335 in 1887, 1,499 in 1886 and 1,808 in 1885. The causes of these murders may be classified as follows:

Quarrels	1,033	Resisting arrest	64
Unknown	247	Self-defense	38
Jealousy	214	Infanticide	66
Liquor	192	Riots	34
By highwaymen	143	Outrage	6
Highwaymen killed	82	Strikes	12
Insanity	41	Duels	2

A newly discovered alum mine in Utah yields 80 to 90 per cent of pure alum..... Wetherell, husband of Emma Abott, the singer, died the other day, leaving Emma over $500,000.....The most important of the amendments to the State constitution just formulated by the constitutional convention of New Hampshire provides for biennial sessions of the Legislature, beginning in January instead of June, and gives the legislators a salary of $200 instead of $3 a day. Votes will be cast on March 12.....

An Extended Popularity.—Brown's Bronchial Troches have been before the public many years. For relieving Coughs, Colds and Throat Diseases they have been proved reliable. Sold only in boxes. Price 25 cents.

AGRICULTURAL NEWS.

SATURDAY, January 19, 1889.

THE demand in the foreign quarters of London for roasts and fillets of horse-flesh, has assumed such proportions, that meat venders are obliged to maintain a constant supply of this equine product..... In 1887 the United States exported bread stuffs to the value of $158,528.053; the exports for 1888, notwithstanding the shortage in European crops, were valued at only $112.615,376. Before the harvesting of the next crop it is probable there will be a revival of the export trade; but a reduction of nearly $36,000,000 in the value of bread-stuffs sold has made a serious pull upon the trade balance ..... The Pennsylvania Agricultural Society, in session at Harrisburg, has elected John McDowell President; A. H. O'Brien, First Vice-President; D. W. Seiler, Secretary; John J. Nissley, Treasurer.....The shipment of corn from Baltimore to European ports was unusually large this season. On Saturday five steamships sailed with an aggregate of 332,000 bushels. There are several other vessels in port loading, and others are expected there soon to take on cargoes for foreign ports. The greater portion of the grain goes to Ireland, although French ports and Antwerp have received some large consignments. .....The New York State Grange will hold its annual meeting at Syracuse, beginning on February 15, and lasting three or four days.....The next Maine Legislature will be asked to pass a law giving a bounty of 10 cents for every dead crow. It is estimated that the pests now do damage to the amount of $100,000 a year to the farmers of the State .... The unpaid bills on account of the last Massachusetts State fair at Springfield amount to $4.223, to pay which there are only $865 in the treasury, but $2,748 of the guarantee fund promised by citizens are still unpaid, leaving a credit balance of $611. The following officers of the Bay State Agricultural Society were chosen the other day: President Col. H. S. Russell, Milton; Secretary, T. H. Appleton, Peabody; Treasurer, Col. W. H. Bowker, Boston; and a long list of vice-presidents and trustees.....

Evidence.

THE best we can say of Compound Oxygen is not half so convincing as the report our patients give of it.

While you may be ready to accept our statements still the words of others have more of the character of evidence. There is encouragement in the following:

GLASGOW, Ky.

"I regard Compound Oxygen as a wonderful remedy, and shall ever be grateful to you for it. JAS. B. MARTIN.

MIDDLETOWN, N. Y., January 25, 1888.

"I have used the Compound Oxygen now for about three years, and consider it the most efficient remedy ever offered to the sufferer. REV. WM. MCGLATHERY.

SUMTER, S. C.

"I have used the Compound Oxygen Home Treatment from DRS. STARKEY & PALEN as a revitalizer, and have experienced marked benefit from it. MR. N. G. OSTREN, Proprietor *Watchman and Southern.*

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

Crops & Markets.

SATURDAY, January 19, 1889.

The December report of the Department of Agriculture, which publishes in detail estimates of some of the more important crops, makes the product of corn 1,987,790,000 bushels, grown on 75,672,763 acres, valued on the farm at $677,561,580, or 31.1 cents per bushel, against 44.4 for the crop of 1887, a decrease of 23 per cent., the product of 1887 being 27 per cent. less, in volume, than that of 1888. The yield of the commercial belt, or seven corn surplus States, averages 33.2 bushels per acre. The Atlantic Coast, south of the Potomac, averages 11.2 bushels of comparatively poor quality.

The wheat aggregate is 414.868,000 bushels, grown on 36,339,138 acres, valued at $384.248,030. The average yield is therefore 11.11 bushels per acre: winter wheat 11.6 bushels, and spring wheat, 10.3 bushels per acre. The average farm value is 92.6 cents per bushel, against 68.1 cent for the previous crop, a difference due more to foreign than domestic scarcity.

The aggregate for oats is 707,737,000 bushels, grown on 26,998,282 acres, and valued at $195,424,240. This is 27.8 cents per bushel, against 30 cents for the crop of 1887

A comparison of aggregate values shows that the present corn crop is worth $31,000,000 more than the previous one; wheat $74,000,000 more; oats $5,000 000 less.

It will be noticed that in the above report Statistician Dodge says nothing about the deficiency in the weight of the wheat crop, leaving that presumably for his March report as usual. This shortage is variously estimated at from 20,000,000 to 30,000,000 bushels. In measured bushels, Professor Dodge's latest estimate is about 8,000,000 bushels more than the last previous estimate, which was 406,000,000 bushels. At Chicago the report was accepted on Monday and Tuesday as an exceedingly bearish document by the wheat speculative public, and the market was borne down by tremendous offerings. New York came in first with terrific selling orders. All the private wire houses and a great many firms that do not have private wires were heavy sellers. Local heavy-weights were quick to catch the drift, and among the number Ream figured as a tremendous seller early in the day and during the early stages of the break that followed the reception of the Government bulletin.

The annual report of the tomato pack of the United States and Canada, as compiled by the American Grocer, indicates a second era of over production. Of tomatoes there were put up last season 3 319.437 cases of two dozen tins each, or a total of 79,666 488 cans, costing at points of production about $6,000,000 and reaching consumers at a total expense of $8,000,000. The acreage was largely increased in all directions, but fortunately (as the result shows), the weather was unfavorable to the proper and full development of the crop; and yet, in spite of a cold and backward season, heavy periods of rainfall in some States and long droughts in others, and early killing frosts in October, the pack turns out to be unusually large, reaching a total of 3,319,437 cases, against 2,817.048 cases in 1887. The canning industry has grown rapidly in the Western and Southern States, largely reducing the demand upon Baltimore, Philadelphia and New York for such goods. In a few years each section of the country bids fair to supply its wants from home canneries. The leading points of production are Maryland and Virginia, credited with 1,118,733 cases; New Jersey, 789 363; Delaware, 227.030; New York, 197,432; Western States, 789,363; Eastern States, 43,360; Canada, 73,990.

SAVED HER LIFE.

DEPOSIT, N. Y., November 8, 1888.

Mr. Wallace Barnes, Box 604. Bristol Conn.

Dear Sir:—The heifer is in calf and will be due February 17th. She had a calf when two years old, but for two years we have not been able to get her in calf until last spring; we gave her your medicine for three weeks before being served, and but one service proved sufficient. We have had her served by different bulls. We sent her away from our farm several miles to another farm and had her served there. We gave her prescriptions from good veterinary surgeons, and we used injections, trying at the same time to dilate the os uteri, but it was all in vain. We had determined to beef her, when your advertisement caught our eye, offering Harboriri at $2 a bottle. Yours truly,

A. DEVERAUX & SON.

DEDERICK'S HAY & COTTON PRESSES, are sent anywhere on trial to operate against all other Presses, the customer keeping the one that suits best. No one has ever dared show up any other Press, as Dederick's Press is known to be beyond competition, and will bale with twice the rapidity of any other. The only way inferior machines can be sold is to deceive the inexperienced by ridiculously false statements, and thus sell without sight or seeing, and swindle the purchaser. Working any other Press alongside of Dederick's always sells the purchaser a Dederick Press, and all know it too well to show up. Address for circular and location of Western and Southern storehouses and Agents.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

JIM was fully equal to the occasion. He pulled his chair up by the side of the minister and began: "What be yer g'nter give us fer a talk ter morrer?"

"It was my intention to preach a purely doctrinal sermon to-morrow, the first of a somewhat extended series, but I shall doubtless introduce a few practical ideas. My topic will be 'Can any good come out of Nazareth?'"

"Wall, sir, I spose that'll be a big thing. I heare'd lots of the boys askin' the same thing," and Jim made haste to change the subject. No doubt he was a little afraid the minister would ask him in which direction Nazareth might be found.

"Wall, how do ye like Drum Lake?" Jim asked at last.

This was a hard question for the minister to answer. When, two days before, he had looked upon the snow drifts that covered all that was left of "St. Paul's Church," he had made up his mind that Drum Lake was indeed a modern Sodom. But his duty lay within the town limits—he had been sent to "build up" the church, and he therefore hoped to find some redeeming quality. So he skillfully compromised matters by assuring Jim that he was much impressed with the place.

"Wall, I thought ye would be," replied Jim, "didn't you, Ben?"

Mr. Stone made haste to back up his friend's assertion. He added, as if to show his appreciation of the delicate compliment given Drum Lake: "Them idees is what knocks Parson."

"I don't s'pose," continued Jim, as he held up his boot in front of the fire, "that you ever done much work in the woods, did ye?"

The minister assured him that he had never done any work of that character. He had often thought, however, that he would like to try it.

"Have ye? What kind of work do ye s'pose ye'd like ter strike, chopin', jerkin' a saw, or swampin', or what?"

The minister had not exactly decided as yet what department he would prefer to enter. He would like some romantic or heroic work, he thought.

"Wall, that's the idee I hed," said Jim, "Somethin' heroyic like. I say, Ben, whare do ye s'pose Parson could git a job on some heroyic work in case his preachin' don't pay him big."

"Wall, I hev an idee he cud git inter the cook's shanty," answered Mr. Stone, after a moment's reflection.

There was a pause in the conversation. The Rev. Grayling was anxious to get rid of his visitors, yet he did not dare to let them see it. Mr. Stone broke the silence at last. "Say, Parson, what did ye give for them boots?"

But Jim ignored this question, so we can never know whether the bargain was a good one or not. Pretending to see the violin for the first time, Jim remarked, "Parson, I see you've got a fiddle there."

"Yes, sir," said the minister, timidly, "I—I—play a little."

"Do ye? Wall, Parson, I believe you're jest the man ter help us out of a big hole. Yer a regular Jonas fer us."

I do not know what historical character the Jonas referred to may be, the comparison was evidently very complimentary to the minister. He looked at Jim in mild wonder, for he hardly liked to be called a "Jonas."

Jim was fairly started at last. "Ye see, Parson, we hev been thinkin' of havin' a sorter soray like down ter Cobb's store this evenin', singin' an' speakin' ye know, an' all the excetterays. They wuz a feller—Mr. Jacobs—comin' over from Carter's ter jerk a bow fer us, but he's gut full; thet is, he's met with an' accident, so seein's we ain't gut no music, couldn't we git you ter go down an' play us a tune or two? We'll treat ye an' feed ye well, an' give yer a front seat. What do ye say?" and Jim leaned back in his chair to watch the effect of his words upon the minister.

Poor Mr. Grayling! He was at his wits' end surely. What should he do? This must be the dance that his former visitor referred to. Think of it—he the Rector of St. Paul's Church providing music for a dance.

"But there will be dancing there, will there not?" he managed to say at last.

"Wall, 'pears ter me I did hear one or two speak about dancin', seein' its so clost to Easter ye know, Parson, 'cause after termorrer' 'cordin' to youse feller's idees, we hev ter quit fer quite a piece of time"—Jim was a little mixed in regard to the lenten season.

"But, my very dear sir, you must be aware of the fact that I am conscientiously opposed to dancing."

"So be I as fur as thet goes; ain't you Ben?"

Mr. Stone hardly dared commit himself on this leading question. I hardly think he was sure of the meaning of the words "conscientiously opposed." He fell back upon his usual—"that's what knocks."

Jim braced himself for the final struggle.

"Now, then, Parson, we three be all agin this dancing bizness, an' like enough if we brace right up to it we kin break it all down. You jest go down thar with me, an' I'll introduce ye 'round an' give ye a good send-off. Then ye kin play a tune or two on yer fiddle, an' I'll bet ye'll have the biggest mob ye ever preached ter when termorrer comes." And Jim finished his remarks by looking round at the company as much as to say, "Who can beat this matchless programme?"

What could the weak little man say in answer to this outburst of logic and eloquence? Even Mrs. McKelvey had deserted him, and when he turned his spectacles appealingly upon her, she, in answer to Jim's supplicating wink, advised, "I think it would be a good thing for 'e, Parson."

"But," stammered the minister, evidently at the very last ditch of his defences, "I had hoped to be able to devote this evening to the formation of a choir for our church service."

"Wall, tell me what kind of a quire ye want, an' I'll get it ef it's ter be found in Drum Lake," Jim was bound to carry his point at all hazards.

"We usually form our choir of boys; four good voices would be sufficient for to-morrow."

Jim was in ecstacy. "Parson, now yer striking sap. I kin git ye four of the finest singers ye ever see ef ye will give us a lift with yer fiddle. Come, will ye?"

The minister was fairly cornered. There was no possible escape for him now, and he was obliged to say that if Jim would provide the choir, he would attend the "soray."

"Come on, Ben," said Jim, when this point was settled, "We'll jest roust out them singers," and he led the way to the door.

Mr. Stone followed his leader. He was wondering how Jim could ever keep his promise in regard to the choir. He had thought of suggesting himself as tenor with Mr. McKelvey as a possible bass, but he was willing to leave it all to Jim. He had a very high opinion of that gentleman as a manager, but when the new plan was disclosed, I really think Jim would have received at least one vote for President of the United States could he have been induced to run for that position. "Ben," said Jim, "you jest go down that street an' coller the fust two boys you see. It don't make no odds who they be. Jest coller 'em an' bring 'em in. Jest resk it ter me. I kin make ole spettycles think he's gut the biggest quire that ever sung."

Mr. Stone did not need much urging. He started down by the mill, while Jim went in the opposite direction.

If Jim had had plenty of time, he could easily have found four boys who would gladly have helped him out of his trouble. But time was short, and he decided to "coller" a choir, and trust to his great powers of persuasion to keep them in trim.

As Ben walked by the old mill, he noticed a slight ray of light stealing out through a crack in the door. This was such an unusual thing in decaying Drum Lake that he stopped even his present urgent errand. He put his eye to the crack, and made a hasty examination. There must have been some startling act on the boards, for he turned, and ran with all his speed in the direction Jim had taken.

Jim was not meeting with great success in his hunt. He was much surpised when Ben came up behind him at such headlong speed.

"Jim" said the messenger—"I've gut 'em dead. Andy Brown an' Mox Jensen has gone down ter Bryan's Mill to fight. They's a dozen boys down there ter see it out. We kin git the Parson's quire there jest like rolling off frum a log."

(TO BE CONTINUED.)

THE POST OFFICE CLUB.

THE parrot was actually happy last Saturday night. He danced a sort of jig on the hot stove-pipe and winked his red eye furiously.

"Farmin' don't pay! Farmin' don't pay!"

Oh! how he croaked it out! Didn't it do him lots of good to thus pulverize the opposition with his unanswerable argument? The parrot had reason for his extra energy. We had just had a funeral in our neighborhood; that backed him up wonderfully. It was old Mrs. Grinder that we buried. Her's had been a sad life. Old Grinder started in, years ago, with the idea that the sole object of life was to make all the money he possibly could at as little outlay as possible. I guess he succeeded, but while he was doing it he rubbed all the fertility out of his farm, all the happiness and beauty out of his wife's life, and just about all the charity out of his own heart. His boys were smart; they had sense enough to run away and get into something that manufactured happiness. The daughter stood it as long as she could for her mother's sake—then she ran away with a tin-peddler. The old man has a good, round sum tucked away in the county bank. I wonder how much it was worth to him last Saturday as he sat by the head of the coffin with his face buried in his great, rough hands. How pitiful it was! That poor, thin, patient face! How she had toiled and slaved and carried the cross all through these years. It all came back to him. He could not have starved his soul so completely that it could not respond to that flood of memories. How true, how faithful she had been to him! The tenderness came too late. She was dead! Why couldn't he have felt as he felt then, 30 years before? It came too late, she was dead. The parrot was right about old Grinder's farming. It didn't pay—it was a losing business all through—and yet, think what it *might* have paid him!

Well, the fact is that the day's proceedings cast a gloom over the club meeting and nobody felt able to argue with the parrot as it danced on the stove-pipe and croaked:

"Farmin' don't pay! Farmin' don't pay!!"

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Joseph Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined."

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

PEERLESS DYES Are the BEST. SOLD BY DRUGGISTS.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

LAWS RELATING TO FARMERS AND HIRED HELP

THE laws relating to farmers and their hired help vary somewhat in details in the different States; but briefly they are substantially as follows in all.

The relations between the farmer and his "help" rest wholly upon contract, expressed or implied. If the contract is for less than a year's service, it need not be in writing; but if the service cannot be performed within a year from the date of the contract, the latter must be in writing in order to be legally binding. This is the case in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New Jersey, Delaware, Pennsylvania North and South Carolina, Ohio, Georgia, Florida, Illinois, Arkansas, Missouri, Tennessee, Texas, Virginia, Kansas, Mississippi, Maryland, Kentucky, Indiana and Minnesota. In New York, Michigan, Wisconsin, Oregon, Nevada, California, and Alabama oral contracts are absolutely void. If a farmer has made an oral bargain to employ a person for a year, and the contract can be completed within that time, it is binding; but if the performance of it is to begin at a future day, so that the service cannot be completed within a year, the contract cannot be enforced. An oral contract, however, to hire a person for a year, to commence the next day, is valid. If no definite period of employment is agreed upon, the farmer has a right to discharge and the laborer a right to leave at any time, without cause. If there is no special bargain with regard to hire, the farmer must pay a reasonable value for the service, the amount to be determined by the current rate of wages for similar service at the time and place of performance. It is essential that the parties should have the legal capacity to contract. Thus, if a laborer under age binds himself for a specified term at a fixed price, he is not bound by his bargain, and if he leaves, he is entitled to what his services were reasonably worth, without any deduction therefrom for his breach of contract. If a contract is made on the understanding that either party must give notice beforehand of the termination of service; both parties are bound by it. The mere fact that the employer, whether master or mistress, is accustomed to give notice is of no consequence unless it is understood by the employé when the engagement is made. Where a farmer employs a laborer for a definite time, and before the termination of the term, the man voluntarily leaves, without just cause or the consent of the farmer, the laborer cannot recover any part of his wages, whether he has contracted to stay a year for a round sum or a year at so much a month. If he leaves even the day before the end of his term, and the whole year's wages are due, he cannot recover a cent in most of the States.

In New Hampshire, Iowa, Mississippi and Texas, however, the employé can recover what his services were reasonably worth, less the damage to the employer by reason of nonperformance of the contract. If the farmer has made a partial payment to his hired hand, who has left his service without valid excuse before his term expired, he cannot recover the money, even though it was not due at the time of payment, and if he has given a note for the amount already earned, he will be obliged to pay it. But the farmer can recover such damages as he has sustained from the man who has broken the contract, and the latter cannot set off against his claim the value of the work he has done and not been paid for. If the laborer leaves even for a single day, before the end of his term, the farmer is not obliged to take him back or to pay him for the work he has done. If, however, he is prevented by illness from completing the contract, he can recover *pro rata* for the services he has rendered. In the absence of an agreement to the contrary, a person is entitled to legal holidays, and is not bound to "make fair weather," or to lose time when there is nothing for him to do. It is otherwise with a person hired by the day. A hired man who lames a horse or injures a tool or machinery is liable for damages only when the injury is the result of carelessness. On the same principle, a domestic cannot be legally made to pay for broken crockery unless there is an express contract to that effect, if the domestic has exercised ordinary good care.

If a farmer has to furnish board and lodgings, per contract, for his hired man, and does not provide enough wholesome food and suitable lodgings, or treats him improperly, by assaulting him, the man is justified in leaving. So he is if he is compelled to work on Sundays, except to do the necessary chores, such as feeding live stock. Any act on the part of the farmer, prejudicial to the morals, reasonable comfort and safety, health or reputation of his laborer will justify the latter in leaving So will the habitual use of blasphemous language towards the man, but not the use of harsh language; nor will he be justified in leaving before the end of his term, because he has quarreled with a fellow employé. The jury must decide whether the laborer had reasonable ground for leaving the service, the burden of proof being upon him to establish the fact. Every contract is subject to the right of the farmer to discharge the laborer for sufficient cause without rendering himself liable for future wages. To justify such dismissal, the employé must have been guilty of wilful disobedience of a lawful order or moral misconduct, pecuniary or otherwise; or habitual neglect. Insulting language towards his employer or members of his family, habitual drunkness, unwarranted absence, and fraudulent conduct would justify dismissal; but in all such cases the discharged man can recover whatever his past services were actually worth to the farmer. A contract for services may be dissolved by the expiration of the term for which the laborer was hired; by the death of either party, or by the laborer becoming unable to perform his duty owing to illness or permanent disability. In such cases the employer must pay for the services actually rendered, and in case of the death of the employé, his representative is entitled to recover what his services were reasonably worth. If a farmer discharges a hired man without valid cause, he renders himself liable to a suit for damages, and if the man cannot secure suitable employment, the measure of his damages will be the amount of wages he would have received had he not been discharged.

The farmer must furnish his hired man with suitable tools and implements, and will be liable for any injury which may happen to the latter from any known defect in the implements; but if the employé's negligence contributed to the injury he cannot recover. If he was injured by the negligence of a fellow employé, the employer is not liable unless he is in some way in fault; still the latter is bound to exercise due care in selecting his employés, for he has no right to expose one to danger from the incompetency or recklessness of another. The hired man, however, must take the ordinary risks incident to his occupation. The employer is bound by contracts made by his employé in the course of his regular business; but, in order to be binding, such contracts must be within the scope of the man's authority, expressly conferred or implied by the farmer's conduct. The farmer is not bound to provide a physician, medicine, or attendance in case his employé falls sick. A farmer is responsible in damages to third persons for any injury done by his employé through negligence, fraud, deceit or even wilful misconduct, if it is done within the scope of his regular employment, and this though the farmer did not authorize or even know of his laborer's act or neglect. Even if the latter in the commission of the act wilfully violated his employer's orders, still, if the act was done in the course of his employment, the farmer is answerable. But he is not responsible for any act or omission of his employé, which is not connected with the business for which he was engaged, and which does not happen in the course of his employment. The farmer, however, is entitled to recover from his employé the amount of the judgment he has been compelled to satisfy to a third party for injury due to the negligence or misconduct of his help. Any person who entices away a person employed by another under contract, knowing such to be the fact, thereby renders himself liable for an action for damages for all the inconvenience and loss caused to the employer by his conduct; but an unsuccessful attempt to entice a person away is not actionable unless some damage has thereby been sustained by his employer. Nobody is liable for damages, however, for inducing a laborer to leave his employer's service at the end of the stipulated term.

SALZER'S WHITE WONDER OATS. PROLIFIC

$750 IN PRIZES ON WONDER OATS!

Over 100,000 customers of 1888 gladly testify that they **INCREASED ALL YIELDS.** Yes, often **DOUBLED** them by sowing **SALZER'S NORTHERN GROWN SEEDS.** Because **no other seed** is so full of life, vigor and vitality—so **prolific and early** as Salzers.

OAT NOVELTY--WHITE WONDER!

This is the most wonderful Oat we have ever seen or heard of, and we have tested EVERY sort offered by **EVERY** seedsman in America, but none come half way up to it in **YIELD,** vigor, beauty and quality. Scores of 1888 customers say: **SALZER'S GIANT FLAT DUTCH.** Yielded 5 to 10 times as much as common oats! Its enormous yield is due to its great stooling properties, long ears and plump kernels. **Early, fine,** wonderful.

$750 in prizes for Largest Yield in 1889. See Catalogue about it. First Prize $400. Who wins it? The farmer wants big crops. Well, he can have them every time by sowing my seeds—yielding on wheat, 40 bu., barley 70 bu., new corn 125 bu., potatoes 640 bu., etc. Headquarters for all Farm Seeds, Grasses, Clovers, **LUCERNE CLOVER, MILLET and ENSILAGE CORN.**

Floor area of seed store 2 acres. Potato cellar capacity 60,000 bu. 26 Packages Earliest Vegetable Novelties, postpaid, $1. ☞ Send 8c for **Wonder Oat** and Grain Samples or 10c for Giant Cabbage and receive elegant Catalogue.

JOHN A. SALZER, La Crosse, Wis.

SEEDS PLANTS AND TREES **ROSES PLANTS**

GRAPE VINES, FRUIT and ORNAMENTAL TREES

CHOICEST OLD. RAREST NEW.

Among the latter we introduce the **CRAWFORD STRAWBERRY.**

YOU WANT IT! It combines more good qualities than any other. If you want **PURE TESTED SEED** or anything for **ORCHARD, GARDEN, LAWN or PARK,** send for our

VALUABLE FREE CATALOGUE

containing about 140 pages with hundreds of illustrations. **IT'S A BEAUTY! ORDER DIRECT. Get the best at honest prices, and** save all commissions. Thirty-fifth year; 24 greenhouses, 700 acres.

THE STORRS & HARRISON CO., Painesville, Lake Co., O.

Humorous.

SHE: "I must show you my new clock before you go." He (facetiously): "Some of my friends tell me I am homely enough to stop a clock." She: "Oh, that won't matter! It can be started again."—*Life.*

MINISTER (to Bobby). "So yesterday was your sixth birthday, was it, Bobby?" Bobby, (with great pride): "Yes, sir." Minister: "You seem to be proud about it, Bobby:" Bobby: "I am; pa's got to pay fare for me on the street cars now."—*New York Sun.*

"WHY did General Washington cross the Delaware on the ice during the storm of an awful night?" asked a teacher of her young class in history. "I reckon," piped a small voice in answer, "it was because he wanted to get on the other side."—*Farm Journal.*

"ANY important news in railroad circles today?" asked the editor, as Faber rushed into the office and hastily began to scribble on a pad. "Yes, there must be a frightful accident down the road, for when I called at the office I was told there was no information for the press to-day."—*Puck.*

AT a matinée of Camille—Mrs. Hiller: "I wish you wouldn't be so uneasy, Uncle Phildab. The performance will be over soon." Uncle Phildab of (Canajoharie): "Maria, you've went an' fooled your old rel'tive. Here I've been a-settin' more 'n two hours, an' I ain't seen a darn camel yet."—*Judge.*

DAUGHTER, aged 33 (facetiously): "Papa, I found a dozen gray hairs in my head this morning and pulled them out. Don't you give me away though." Father (sighing heavily): "Give you away, Emily? I've abandoned all hope of it."—*Chicago Tribune.*

"WHAT did the doctor pronounce your ailment?" inquired the wife, with a tremor of anxiety in her tone, as she came into her husband's sick-room. "He pronounced it as if it were spelled bronkeetus," exclaimed the indignant Bostonian, straightening himself up in bed, "and I requested him at once to make out his bill and go."—*Chicago Tribune.*

THE BROKEN ONE.

LADY: "What's the matter, my little man?"

BOY: "Leander Binks giv my girl half an orange, an' she's run off with him."

LADY: "Oh, never mind. you can soon find another sweetheart."

BOY: "Nay, nay! sweet lady. Wedlock is not for me; my only hope is to fill an early grave."

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Josepn Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined.

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

National Potato Contest.

A Mighty Interest is Shown in the Project.

THE SOUVENIRS WILL PROBABLY AMOUNT TO OVER $1,000 IN VALUE BEFOR. SPRING.

INSTRUCTIONS AND SUGGESTIONS.

THE R. N.-Y. proposes that its lady readers enter into a potato contest of their own. In the way of suggestion merely at this time, let us propose that the plot be 33 feet square, or just one-fortieth of an acre. This is a very convenient size and shape. The plot may be larger but not smaller. Each contestant will choose her own method in *every* particular, the kind and quantity of fertilizer, or manure, the variety of potato, the distance apart to plant, etc., etc. It will not, of course, be required that the contestant do all or any of the actual work herself, but merely that it be done under her *direction and supervision.* The *aim will be to produce the largest quantity of merchantable potatoes on the chosen area at the least cost*; the standard of what constitutes a "merchantable" potato to be fixed hereafter. The reports (to be satisfactorily substantiated) will give the full particulars as to the kind of soil, fertilizer, manure, variety of potato and method of culture, and are to be handed in before the first of next October.

THE REWARDS.

The R. N.-Y. is collecting 500 or more rewards, or *souvenirs*, to be given to a corresponding number of the most successful contestants.

We believe this to be a very laudable project and certain to do a deal of good in very many ways.

The R. N.-Y. begs to express the hope that those of its friends who may take the above view of the project, will continue to encourage it by donating suitable articles or by contributing such moderate sums of money as in the aggregate may enable the committee (to be appointed) to extend the number of souvenirs as far as possible, and in this way help to secure a general interest and enthusiasm throughout the entire potato-growing country.

The Committee to examine the reports and to award the prizes will be made up of persons (either men or women as preferred) whose names shall be a sufficient guaranty of strict, impartial action.

FINALLY.

All of our female readers, whether young or old, who desire to enter the lists will kindly send in their *names* and *addresses* on postal cards, *adding the words* "FOR THE POTATO CONTEST."

The value of the souvenirs already promised amounts to over $900, as will be seen by reference to another page. *Our lady friends are sending in their names for the contest freely and a grand national contest, likely to engage the attention of the civilized world, is assured.*

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII. NO. 2036. NEW YORK, FEBRUARY 2, 1889. PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered According to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

Farm Economy.

TWO POTATO TOOLS.

IN growing a few acres of potatoes every year I find a great saving of labor and time in using a potato plow to dig the tubers and a screen to sort them. The original plan of my plow came from the R. N.-Y. some years ago. I had the iron beam of my single shovel-plow bent so as to lay the plow nearly flat; then I straightened the shovel somewhat and had bars riveted to it. Chains drag behind the bars. This implement does good work if the cultivation has been level; but if the ground is badly ridged, it does not bring all the potatoes to the top. The plow had been such a useful implement to me and to some of my neighbors, that I thought I would slip down "home" to my father-in-law's, some six miles away, and do him a good turn for many good ones he has done for me, by throwing out his five acres of potatoes; but, to my great surprise and annoyance, I found the potatoes so deep that when I gauged the plow to run under them, so much earth poured over it that the tubers were not all brought into sight. I at first thought I had a "two-story" hill, like those described later in the RURAL; but I now think that the depth of the tubers was due to a clover sod and mellow cultivation with large shovels. An illustration of this plow is shown at Fig. 20, page 68.

This year I made a screen on account of having an unusual amount of small potatoes. I first made a chute with cross-bars, having openings between them, but potatoes too large to pass the openings would lodge and clog them. After cutting slots in a salt barrel and revolving it like a wheat screen, I had a sheet of wire-cloth made out of No. 10 wire, and with square meshes an-inch-and-a-half in the clear. It was 48 inches long by 28 wide. I rolled it up the long way, making a cylinder which I introduced into the frame in place of the barrel, and revolved it with a crank. It did well. Potatoes, dirt, etc., were shoveled into the hopper and, falling into the screen, the dirt and small potatoes dropped through on to an inclined plane made of wicker-work, with half-inch meshes through which the dirt fell, the little potatoes rolling down into a basket, while the large ones poured out at the other end of the screen into another basket. The screen works well with Rose potatoes; but for Burbanks and long, slim tubers generally the meshes should be a little smaller. The screen is shown at Fig. 19. E. H. C.

Mattsville, Ind.

DEVICE FOR HAULING BRUSH.

(*See page* 68.)

DRAWING brush from an orchard has always been a perplexing job with me. I have never read a description of any good way of doing it. Here you have my way. The drawing Fig. 21 shows the implement. In this 1, 1, 1, represent the frame, and 2, 2, 2, the stakes. I do not fasten the stakes in the holes or pile the brush so high that the stakes cannot be pulled out when I want to unload. In doing this I drive the frame out from under the brush, replace the stakes, and am ready to load it again. The load being so low, a large one can be drawn without interfering with limbs of the trees. The expense for such an arrangement is too small to be mentioned. B. B. T.

Wakeman, O.

Farm Topics.

A JERSEYMAN'S JOTTINGS.

THE RURAL sends me the following letter. It is from a subscriber at Paducah, Kentucky.

"In the RURAL of October 27, appeared an article about "City Farmers," that has furnished me food for considerable reflection, and I have scanned each succeeding copy of the paper expecting to see the article criticised either by the editor or some of the many subscribers. The writer seems imbued with a sentiment so often met with in our local farmers' clubs and other similar organizations, that I cannot refrain from pointing out what I consider some of its errors, and, I may say, evils. He criticises most unmercifully some of the "projects" and "schemes" proposed by those city farmers, and says that he advises them to raise nothing but hay and rye, with, perhaps, a few potatoes.

Now the thought I wish to present is this: Does either of them "know it all"—or, in other words, is not "Jerseyman" and the "city farmer" *each* in possession of facts and information that the other needs?

There is no question but that a man brought up in a city knows more about the wants, tastes and fancies of city people than does the ordinary farmer. He also knows more about the "commercial world;" knows better how to buy and sell, also the most popular and attractive methods of preparing products for market, etc., etc.; while, for want of experience (or rather lack of information obtainable from reliable agricultural papers and books), he is far behind his neighbor farmer in the production of crops. Let these two classes of farmers establish a farmers' institute, or, better still, a private circle, club or wheel (as they may be pleased to call it), composed of not more than 12 male members; let them have their meetings monthly or semi-monthly at the different homes of the members, taking them in rotation and spending the day. The forenoon can be devoted to going over the farm, the visitors seeing how the proprietor plants and cultivates his crops, utilizes stony or swampy lands, constructs his fences, prunes and cultivates his orchard and vineyard, houses and feeds his stock, etc., while the proprietor can avail himself of the advice and counsel of his fellow farmers upon various points upon which he may be undecided. After returning to the house and enjoying a substantial farm dinner, they can go into session and (if it be their first meeting) permanently organize and designate such topics for discussion and investigation at the next meeting as will be to the mutual interest of all.

A "POTATO SEPARATOR." Fig. 19.

Here the city farmer, from having more time and opportunities for keeping posted, can contribute his share of information by posting the Jersey farmer on statistics relating to the extent and condition of crops, prices, etc., and give advice about packing and shipping. The Jerseyman can point out the errors the city farmer is committing, and offer such advice as may be necessary. What else can and should be done at these meetings I will not now venture to suggest, lest I make this article too long; but if each member that is fortunate enough to have a wife, will take her with him to these meetings, she will enjoy them, live longer and be happier, take more interest in farming and the world generally and be as much benefited by seeing how her hostess conducts her household affairs, as he will be by his convention.

But I have strayed somewhat from the original thought: Are not some, at least, of the "schemes" proposed by the city farmers practical, and would they not be profitable if taken hold of and carried out in a practical manner? And would not the Jersey farmers profit by diversifying their farming more than "Jerseyman" recommends, and not try to "carry all their eggs to market in one basket?" What we farmers need as badly as anything else is an interchange of ideas with men experienced in matters of which we are ignorant, and if there were more sociability and sympathy existing between the two parties in question, I cannot help thinking it would be to the mutual interest of both."

REPLY. R. B L.

It appears that I was not quite plain enough in my article. The main idea that I tried to bring out was that in order to make any money at farming a man has got to make a business of it. In this State he has got to do part of the work himself, stay by the crops constantly and make a study of his business. While our friend the city farmer, keeps up his work in the city, he can't farm except at a loss. This is no reflection upon the business ability of the city farmer. It only proves that farming is a mighty intricate business that will surely suffer if you try to make it a side issue. If a man can't give his whole heart and mind to farming he has no business to growl if he loses money at it. I always urge city farmers to raise the crops that require the least labor and care. Take rye and hay. If these crops are well manured and started they grow without the bother of weeding, cultivating and hoeing; one can sell the standing crops if he wants to, and it is a good deal better for the city farmer to do just this business than it is for him to put out a lot of truck, like sweet corn and melons or fruit, that must be handled just right in order to pay.

This I claim is true while we have such help as we ordinarily get in this State. A club such as our friend describes would be a first-rate thing if it could be organized. The trouble is that no club could live long containing two such opposite elements as our city farmers and those of us who have to dig our living out of the ground. We might form a club of our own and they might form one of their own set, but I doubt if we would pull very far together. Why? In order to make such a club successful, there must be some fundamental truth that every member can come back to for a fresh start when his feelings are aroused by a sharp discussion over farm methods. Now, in such a club as our friend talks about there could be no basis for a solid organization. One-half the members would feel that agriculture meant to them the most serious kind of business, while to the other half it would mean a recreation or a scheme for spending some money. Let me argue some farm method with a fellow farmer, and while I might not believe his opinion was very sound I would be apt to respect it because I could feel that he earned his bread and butter by backing it up with actual work. Can I feel so when a "city farmer" advances such schemes as I detailed in my article? JERSEYMAN.

Dairy Husbandry.

BUTTER FOR THE TABLE.

THE way in which butter is served at very

many farmers' homes, as well as at restaurants and hotels, is a disgrace to good butter, and in no way restores health to poor butter. Some farmer's wife says good butter served in a coffee cup is still good butter, and bad butter in neat little pats is bad butter still. Very true. But do you not love to have everything neat and convenient? I proceed as follows: We prefer fresh butter and hence save only three or four pounds from each churning. I use the bread-board and rolling-pin in salting, not touching my hands to the butter of course. After the salt is thoroughly worked in the butter, I roll it out to about three-quarters of an inch in thickness. I then use two little grooved paddles of the following description: They are each 2¾ inches wide, 4½ inches long, a quarter of an inch thick, with four-inch handles. One side of each paddle has 27 parallel grooves running lengthwise. These grooves are about one-eighth of an inch deep. Cut the butter that has been rolled out flatly on the board, into strips about an inch wide. Take from each strip enough to make, say, a half ounce roll, or more if you desire. Take a paddle in each hand and roll the butter on the grooved surface. In a few seconds, you will have a beautifully shaped ball of butter about large enough for one person. With a little practice these balls or pats can be made round, oblong, cob shaped, or double cone-shaped with the large diameters together. The surface of these pats, however made, will be full of small indentations and look very pretty.

I expected at the outset to prepare the butter in this way for dinner parties only, but having become accustomed to its use, I think it is an economy of time and a saving of butter. A farm hand takes from the roll placed on his butter-dish, just as he would, of course, if it was differently served. But there is less time required to clean the butter-dish when served in this way, and my observation is that there is less waste of butter, because when the butter is put on the butter-dish in a mixed shape, considerably more adheres to the dish and is wasted in the wash water. I recently prepared three pounds, making 91 little balls in 15 minutes. J. N. MUNCEY.

THE VERMONT DAIRYMEN.

(RURAL SPECIAL REPORT.)

A lively and instructive convention; hints on cheese making by "the largest cheese-maker in the world;" cheese making lessens competition in our butter markets; quality is money; feeding the wastes of the dairy to calves; dairy products must suit the consumers; growing mangolds; comparative value of mangolds and silage; beets; milk-testing; judging butter; officers elected; why Guernseys are preferable to Jerseys; linseed and cotton-seed-meal for feed; dairy progress in New York; need of culling a dairy herd; utilizing a bull; treatment of young heifers; increasing the fertility of dairy farms.

THE Dairymen's Association of Vermont, assembled in strong force at Burlington, for a three days' convention, January 16, 17, and 18, at the City Hall, which was well filled by them, and the interest manifested in all the proceedings was remarkably strong. The hall was neatly decorated with agricultural emblems, and the exercises were conducted with spirit from the start. The society begins its twentieth year under encouraging circumstances, having been recognized for the first time by the State Legislature, at its recent session, $1,000 yearly having been appropriated for its benefit.

After some opening congratulatory remarks by President Tinkham, Mr. D. M. McPherson, the prominent cheese-maker of Ontario, styled on the programme, "the largest cheese-maker in the world," addressed the meeting upon cheese-making. Referring to the fact that Vermont is mainly a butter-making State, he yet claimed that we had a right to be interested in the progress and prosperity of the allied industry, because the success of the American cheese industry relieved the market for butter of a strong competitive pressure, which it would seriously feel if all the milk that now goes into the vats should be devoted to the creameries. He asserted that there was little difference in the profits of the two industries, and that the scale was turned one way or the other by special and local conditions. The products of the American dairy surpass in money value, the products of any other two farm industries, and are an immense factor in the prosperity of our agriculture. The great point in these manufactures is to perfect the goods in point of quality, for here is the source of profit. There is no money in poor butter or cheese.

Mr. McPherson's chief points were the necessity of thoroughly controlling the expulsion of the 87 per cent. of water in milk, so that the finished product should contain nearly equal quantities of caseine, butter and moisture. The curd must be thoroughly controlled. The sugar of the milk is the most active agent, and must be controlled as the source of that acidity, the due development of which fixes the quality of the product. It will not be possible in this report to follow out the argument in its details, but the audience, which contained a considerable proportion of cheese-makers, followed the speaker with interest, and generally with marked approbation.

In the afternoon the first speaker was Mr. James Cheeseman, Secretary of the New England Creamery Association. His topic was the feeding of the wastes of the dairy to calves and pigs. Pointing out the provokingly little value that whey and butter-milk have as single feeds, he endeavored to show how much and how easily this value can be increased by the judicious admixture of other feeds—especially flax-seed, oat and gluten-meal—with whey for calves, and bran with butter-milk for pigs. Clover feed for the latter was strongly favored. He expressed the belief that there is no profit in feeding pigs on this system beyond 170 pounds before slaughtering.

The evening session of Wednesday was mostly given up to proceedings of a formal and ceremonial character (address of welcome, etc.,) but was concluded with a spirited speech from John Gould, of Ohio, upon the Advantages of Dairy Conferences. Speaking of the advantages of Vermont over the West in dairying, consequent on special adaptation and nearness to markets, he urged the improvement of the smaller farms more thoroughly by dairying, and the building up of the industry by establishing creameries in the hill towns. "I advise you," said he, "to suit the consumers. You must find out what they want, and then fill the want. When you succeed in this you are greatly aiding the general prosperity of the State. The dairy conference and the dairy school are what we need, together with the best apparatus, and a continually advancing skill. Put aside prejudice, seek knowledge, and sift out a system that shall take the lead, and bring in the profits that always attach themselves to the best production."

Thursday's sessions were very lively and interesting, and the hall was well filled. The first address was by the foreman of the Billings farm at Woodstock, George Atkins, an Englishman, who knows how to grow roots, and told the audience a method with mangolds. The ridge system is the only practical one where profit is the object, the seed being sown upon the tops of the ridges and nitrate of soda being applied in the drill to give the seed a quick start. The young plants are singled 10 inches apart, entirely with the common hoe, the neck being straightened so that the blade forms about a right angle with the handle. This is used with a thrusting movement, pushing the surplus plants out. When the first movement is made, a plant next to the hoe falls over, and the next push on the other side will remove all but that plant. No hand work is done, and Yankees soon learn this quick English way of singling the plants. He never gets less than 24 tons of beets (Norbiton Giants) per acre, and he has grown 40 tons, at an average cost of four cents a bushel, on land in a condition to give 50 bushels of corn to the acre. The beets are topped in the field, and the cows are turned in to eat the leaves, which have a considerable value. In tests he finds that cows fed 80 pounds of beets and 12 pounds of hay daily give an average of 20 pounds of milk, costing 9½ cents a gallon, against hay and grain feed producing an equal result at a cost of 31 cents a gallon. Professor Cooke, of the Vermont Experiment Station, stated that analysis of the beets fed show the Norbiton to be as good in quality as any other mangold, and better than some yellow sorts of smaller growth; also that beets are a much better balanced ration than silage. A lively discussion followed, Mr. Gould, of Ohio, defending silage, and saying that in testing it against roots he had found that, not counting the value of the leaves of the roots, the feed from an acre of ensilage was 3½ times greater than from the same area of beets. Dairy Commissioner Brown, of New York, stated that he was keeping 17 cattle and four horses on 20 acres of silage, with an income of $90 from each cow at a cost of $34 for feed, and that he could make butter with a slight profit at 16 cents a pound. Milk-testing by Professor Short's method was then practically exemplified by Mr. Gould, and, by Professor Cooke, with the lactocrite, the first being adapted to the farmer's house use or the factory; the second chiefly to the factory. A simple and effective milk aërater was shown in operation by Mr. McPherson of Ontario.

POTATO PLOW. Fig. 20.

Horseman.

CLOVER HAY FOR HORSES.

T. B. TERRY.

Keeping work horses without grain feed; the kind of hay needed; how to feed; experience with work horses so fed; why the animals are kept on hay; clover for hay should be cut early; driving-horses may need grain; slow working horses don't.

ON page 799 of the RURAL for last year, appeared a short extract from an article of mine in the Ohio Farmer, from which several readers have obtained the impression that I feed my work horses no grain, and they have written asking for particulars.

The impression is correct. No grain has been fed to my work horses for seven years and very little for 20. I find that choice clover hay grown on good land and cut in full bloom or very soon afterwards, will keep work horses in good order with the work I have to do. The hay, however, must be choice. It should be three-quarters clover at least. A little Timothy in it seems to be an advantage. It is more easily cured and the horses like a little for a change, although they prefer clover to Timothy as a rule, and then, clear, early-cut clover is almost too loosening.

Having such hay I want horses of reasonable stomach capacity to feed it to, and I want to feed a reasonable amount three times a day, the heaviest feed being given at night, when the animals are working hard. To keep hay before horses all the time or nearly all, is not the proper way. I want to see them hungry when I go in to feed them. We sprinkle the hay slightly after putting it in their mangers. A common garden sprinkling can is used, and, having water in the barn, supplying it is very little trouble. Feeding in this way, with ordinary care about pulling a horse very hard when he was full, I have had no trouble from heaves. In fact, I have bought horses that had the heaves and worked them for years on clover hay alone.

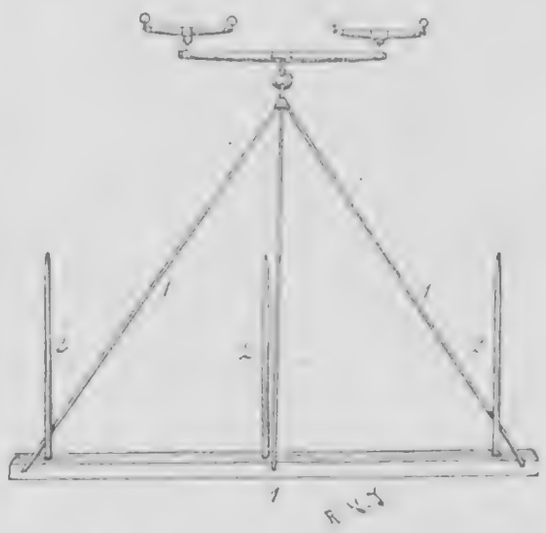
We live 2½ miles from town. I seldom have occasion to drive a horse to a carriage farther than that. For this use, and our regular farm work, and teaming crops to market, my clover-fed horses answer well. Some years I have drawn my potatoes and wheat to Akron, 12 miles away, being months steadily at work at it, and found no trouble in keeping the horses in fair working order without feeding any grain. They were not loaded beyond their strength, however, and were allowed to take their own gait, without being worried by the driver.

In the summer time my horses are fed clover hay three times a day, the same as in the winter. They are kept in box-stalls, in a cool basement, when not at work, during the day. At night they are usually turned out in a small pasture, more to wet their feet and give them a little exercise than for what grass they may eat. When there is very hard work to be done every day, as when we are plowing or moving the crops to market, the horses are kept in the barn at night and given about all they will eat up clean before morning. Now many are situated so that it would be as cheap for them to feed part grain as all hay, perhaps cheaper. I am not. I must raise clover once in three years to keep my land up. Good care is taken of it. The result is I always have literally more hay than I know what to do with. I do not wish to sell any. It is one of the products that should be turned into money on the farm as I am situated. I have yet to find any better use to which I can put 20 to 25 tons of it than to keep my horses on it.

As I write, I can look out of the window and see a field with clover on it, that would have made 25 big loads of hay. It will be turned under for potatoes next spring. Had I not had a great abundance without it, this could have been cut and fed to the horses and the manure returned to the field, at a trifling expense. There would have been some loss, of course; but, after all, my horses could have been kept at so small a cost as to be hardly worth mentioning. I raise potatoes, clover and wheat. My land will bring from 100 to 300 bushels of potatoes per acre. When the yield is 100 to 160 bushels we generally get 70 cents to $1.00 a bushel, as in 1887. Now it would seem foolish to put such land in oats or corn; that is, for money-making.

These facts will probably make it plain to all, why I was anxious in the first place to keep my horses on clover hay, and why, having found out that it can be done, I shall be likely to go on doing so. This is simply my experience, and I am not advising any one to follow me; I want all to think for themselves.

Seven years ago last fall, I bought a fine team of a neighbor. He had fed them grain three times a day. I gradually worked them off of grain; feeding more and more hay. I took care of them myself and just laid myself out to see what I could do. They were in fine condition when I bought them; but, if I remember correctly, 330 pounds more of flesh were put on them during the winter, and their coats shone like silk. I twice refused $500 for them. It took all my skill and strength to handle them. I used to dread to unhitch them from the plow at night and drive them to the barn they were so full of life. I drove them myself entirely, and it took me all summer to work that surplus weight off of them without hurting them—weight that never ought to have been put on, only that I wanted to show what I could do.



DEVICE FOR GATHERING BRUSH. Fig. 21.

This was done entirely with early cut clover hay. For seven years they never had a single quart of grain or ground feed of any kind. Last fall, after digging the potatoes and putting in the wheat, which took some

weeks of solid work, I weighed them and they were a little heavier than when I bought them. They have never once been lower in flesh than what they started with, according to my judgment. Being 13 years old now, they have seen their best days; but they will last longer than if they had been heavily fed with grain. Another point: they have never known a sick day. There is no danger of their being over-fed or fed when too warm. I am abundantly able now to buy grain, and perhaps for a noon feed when I am in a hurry, this might be best; still I am not thinking of changing.

The above story is exactly true in every particular, although it has been a hard one for many to swallow. It has amused the writer more than can easily be imagined to see visiting farmers, when they thought they were not noticed, prying into every out-of-the-way corner of the barn in search of grain. They could not believe me to my face. It is hard to believe anything that is much beyond what one is doing himself.

Certainly all might profit from this to the extent of cutting their clover early. I have seen many a field of clover and Timothy cut for horses as well as cattle so late that it would take considerable grain fed with the hay to make the ration as good as the hay alone would have been if cut in time. There can be no question on this point, and it seems equally certain that it is a poor way to do business. For driving horses feeding grain may be the best plan. They need concentrated food, and a little quite ripe hay goes well with the grain. Dried grass would be too loosening; but it is healthful and grand feed for slow-moving work horses, as well as for milch cows and young cattle.

Summit Co., O.

Entomological.

THE INSECTARY AT CORNELL UNIVERSITY.

At Fig. 22 we show a picture of this building, which is described in Bulletin No. 3 of the New York E. S. This insectary—the word was coined to suit the special uses to which the building will be put—is probably the most complete entomological laboratory yet devised. Special pains will be taken by Prof. Comstock and his assistants to study the life-history of many of our injurious insects. A great deal of space will be allotted to "breeding cages," or places where insects can be allowed to grow and develop in such situations that they can be constantly observed. Those who desire to study the curious and ingenious appliances used in insect breeding at Cornell are referred to the bulletin which, in addition to a description of the insectary, contains notes On Preventing the Ravages of Wire-worms, and The Destruction of the Plum Curculio by Poisons.

Rural Topics.

ABOUT THE POTATO CONTEST.

A WITTY WOMAN'S WISE WORDS.

Reading so many things "unthought of by me" about the Potato Contest at the time of entering for it, being one of the first, caused me to hunt up my thinking cap, and use it too for the benefit of the New Englanders. I suggest that the country be divided into four sections—North, South, East and West—and that the premiums or souvenirs be divided also so that we here in New England can stand on an equal footing with the others; if this cannot be done I fear we may come out of the little end of the horn in contesting with the potato growers of Dakota and other places West.

But never mind; I am not discouraged as it is. I have a pen of 20 White Plymouth Rocks which are aiding me in securing my fertilizer, as their droppings are removed every week and spread on the allotted potato patch. I have spared the life of an old hen which did ample duty in keeping the beetles off of a quarter of an acre of potatoes last year, to aid me in the same good work, as I do not like to have anything to do with Paris-green or hand-picking the hateful things if I can get along without either. She is so faithful and gets her own living, besides presenting me with a dark-brown egg almost every day during the season. My husband says her life is insured till Nature claims her. Her name is Potato-Bug Eater. When I entered for the Contest I supposed I was to do all the work except plowing, and I do intend to do it though I expect to have a good many lookers-on among the other sex, who will no doubt offer me unasked-for advice as to this or that; but my ears will be closed, as I am quite deaf, and will heed the advice of no one.

A teacher of mine, who is now a Congregational minister, said a true lady was as much a lady in the kitchen or field as in the parlor. A true gentleman was such, he said, whether in the barn-yard or in the counting-room or office, and I think so too. I am glad there are others of the same stamp who are not ashamed to be seen caring for a potato patch in the coming Contest.

The lady of 75 years who has entered, warns her younger rivals to "look out." When we see the enthusiasm for doing good cropping out at that age, I think we "younger ones" will have to look out in good earnest or be beaten by such mature minds.

I am glad the male portion of the community are so interested as to be willing to put their brown hands deep down into their pockets to draw forth cash or its equivalent for the souvenirs for the lady contestants, as all of us have a promise of some souvenirs if we make a fair show at the potato bin. At least we will all have the fruit of our labor to eat and enjoy next winter, which will give us something to think and talk about. There is no knowing what good it may do. We women may do so well that we may be asked by our husband and fathers to do the same year after year. Is this one of the reasons why they are so interested?

MRS. O. J. PUTNAM.

Worcester Co., Mass.

MYSTERIES OF THE SEED TRADE.

No. 1.

Great increase in the seed trade; gross puffery and exaggeration by some seedsmen; fraudulent dealers; assuming credit due to others; the Northern-grown seed-humbug.

No kind of business has, perhaps, so greatly increased in the past 40 years as the seed trade. It has adopted the modern methods of using agents and newspaper advertising and, as a consequence, has developed in a remarkable way. The hold gained in this way has been further increased by the distribution of catalogues at a cost, in proportion to value of goods thereby sold, far beyond that incurred in the same line by any other business Many of these catalogues are marvels of enterprise, great volumes of information and beauty. It is also true that in many, indeed in most cases, they are open to criticism. It is evident that the charge of exaggeration can be placed against them. This is a common fault in all trades, but apparently worse in this as seen in the indiscriminate praise and over-statement both in words and illustrations. Pick up some catalogues and you read about thus: No. 1. This is best of all. No. 2. is unequaled. No. 3. is, if there be any difference, better than any other; while No. 4. has never yet been approached. This style has its desired effect; the reader becomes enthused and determines to buy all these good things. Occasionally, however, it may have the opposite effect. So common is this puffing that the seedsman who is averse to it must have other and exceptional advantages to secure success. Now, there is a limit to this; and it depends on the patrons, for so long as they bite the bait will be there.

But would it not be well for established houses to modify this custom and leave it to the charlatans? There are some who are deserving of this title. They are not exactly swindlers, but they get their trade largely by deception. A specimen of this class hails from some little town and assumes the role of a farmer and grower of the seeds he offers, and the originator of some. His style of talk in his circulars is that of the confidence man, and as there is an affinity between such and a certain class, the victims are found among the latter. This style of deception will find its end when men have gained more intelligence, which may be a good while yet. Some of these have no stock, or little of their own, and simply turn over the orders to others to be filled from old and refuse stock, sending tags with their own names, to be put on the packages.

A style of blowing not particularly harmful but in bad taste is that of attaching one's name to a variety that was not originated or even grown by the person who gives his name to it. Mr. Smith offers—"Smith's Peerless Oats," whereas Mr. Brown introduced it, and Mr. Smith did not even grow it. Here it would seem that Mr. Smith gets credit for something, as it were by theft. Here is a catalogue in which we read Jones's Early Summer Cabbage, Jones's Excelsior Flat Dutch Cabbage, Jones's Evergreen Sweet Corn, and, by actual count, Jones's name is attached to 50 more varieties. While this may win, it also repels; for I have heard many men say that they were afraid to send to such a "blower."

A common advertisement is of "Northern-grown seeds," and the claim for superiority is emphasized for those from the northernmost States. Without thorough knowledge on the subject, I venture the opinion that the claim is only half true. Many of the seeds cannot be grown so far north, and, as a fact, without doubt these men get their seeds mostly from the same sources from which the seedsmen of the Middle States get theirs—largely in a middle latitude. Here is an instance: One of these sellers of "Northern-grown seeds," to my own knowledge, bought field corn grown 250 miles south of him, and quite likely some of his Northern melon seeds were grown in Georgia.

To my mind it is not a settled fact that seeds grown in the far north are better than those grown in the Middle States or even, in some cases, in the South. A favorite theory of mine is that seeds are best when grown in the latitude and location where they thrive best, a theory I shall hold to until it is disproved. I should therefore not hesitate to go south for some seeds, where it is not essential that they should mature early. ANON.

Field Crops.

SOWING GRASS AND CLOVER SEED.

HENRY STEWART.

Progress is change; that grass and clover can't take care of themselves an antiquated notion still entertained by old-fogies; no need of a foster crop for either; if one is used, oats as good as any; cause of "poor catches;" personal experience.

What a world of change this is, surely, and change is no more apparent in any other direction than in farm practice. Heretofore it has been thought indespensable to have a grain crop for the protection (?) of grass and clover seed, as if grass and clover cannot take care of themselves! They do this too well when they spring up as weeds where we don't

want them, and, in fact, they are able to do it as well where we do want them; consequently we are gradually cutting loose from the foster crops, and are sowing clover and grass just as we sow any other crops, giving hem all the ground, and all the light and air. sowed a few acres of clover and Timothy, ast spring, alone. The land was thoroughly well plowed and worked with the Acme pulverizer. The grass and clover—a peck of each per acre—were sown, and a light, sloping-tooth harrow was run over the surface. It was a pleasing sight to see the young grass, ike hair, coming through the surface in two weeks after sowing, and the round clover leaves interspersed among the tiny spires of the grass. Nothing interfered with that grass and it came on quickly, covering the ground by the end of May, (it was sown in April), and in August it was a dense mat. In September I turned a lot of calves on to it and they fed it down, and now it does not differ at all in appearance from an adjoining part of the field seeded the year before with oats.

But oats! A few years ago the man who sowed grass seed with oats would risk being thought imbecile at least, perhaps crazy. Fall grain was thought the only crop to seed grass with, and clover was sown on the snow, or on the frozen ground, or on the hard, beaten surface, haphazard, in the spring, to do or die. Usually it did die. Then the poor catch was complained of and seedings that had failed made poor meadows and scanty hay. The thing cured itself. Grass would no longer grow in the old way, and fresh land must be provided, and oats necessarily usurped the place of the fall grain. I say usurped, because the crop is a usurper, needless and injurious, because it robs the grass and clover of the food they need and must have or perish. But grass and clover are sown with oats, and the practice is becoming popular and general. Just as a boy on a log fears to get out of reach of the shore of the pond, and keeps within knee depth of water, so we farmers hang on to the spring grain seeding, and cannot break loose because the young grass is so tender, we think. It is tender, doubtless, but it is too tender to be burdened with a hungry crop to starve and shade it from the air and sun. If one cannot bring himself to this belief, he must choose the oat crop as the foster, and if he does well with the land, giving it manure liberally, the oats will pay for it, and the grass will repay for it, and fit the soil well; the grass and clover will make out to stand the strain and show a fine aftermath on the stubble, and give a good account of themselves the next year. I have about 30 acres thus seeded with oats, not that I thought the oats helped the grass, but that the land was good enough for both—as it was—and I wanted the oats anyhow. But for several years past I have lost every clover seeding made in fall crops, and I have had but poor Timothy and other grass from fall sowing. If one will study the drift of experience now given in the agricultural journals, he will find that the old method is fast being abandoned and that spring sowing is becoming popular and successful. Thus we change and advance, but unless one reads of what is going on, he gets left behind.

Indust'l Societies.

STATE AGRICULTURAL SOCIETY.

THE ALBANY FARMERS' INSTITUTE.

New York crops good last year with several exceptions; farmers' institutes becoming more popular; Treasurer's report; officers elected; Secretary Woodward at work again.

THE annual meeting of the New York State Agricultural Society was held in the society's hall in Albany, at noon, on January 16. The attendance of members was larger than at any previous meeting, save one, since the organization of the society. The report of the executive committee upon the condition of agriculture in the State and the affairs of the society, said that the cereal crops of last year compare favorably with the records of the previous year except in the case of wheat. As to that, although the seeding remained fairly well protected by the snow of last winter, owing to the dry autumn of 1887 the seed did not germinate well, which, added to the effects of the dry, cold weather of April, accounts for a lighter yield per acre and a poorer quality of wheat in 1888 than in either of the two preceding years.

Rye and oats, on the contrary, yielded much more per acre, and while the former was about the same in quality, the latter was much better than in 1887. Barley held the place it occupied the year before, and gave a slight increase in returns per acre, though it was not equal either in quality or yield to the crop of 1886. Corn planting was delayed by continued cold weather, and the severe early September frosts practically ruined a large portion in various parts of the State. As a result, the crop runs far below that of 1887 both in quality and yield per acre, and consequently many farmers have been led to try silage. The hay crop was better in quality, though not quite as high in yield per acre as in the previous year. The September frosts, which decreased the yield of corn, also affected that of tobacco, and were disastrous to buckwheat. The same may be said of broom-corn and sorghum. Owing to a late, cold season and dry weather in midsummer, hops were reported only about one-half the usual crop. Continued autumn rains gave us good late pasturage. Of fruit it may be said that while there were fewer pears, there were many more apples and a much better yield of grapes than in 1887. Last season was favorable for live stock and the losses were less than usual. The demand for a better class of horses is being promptly met by a judicious selection and improvement in the breeding stock. The same may be said of dairy cattle and, in fact, of all kinds of farm stock. The improvement in the quality of dairy products in this State is very noticeable.

The farmers' institutes show much improvement in the second year. So hearty and cordial has been the reception of these institutes, that where at first the people welcomed them, they now demand them. Thirty-seven have been held since the last annual meeting. The society is satisfied that the agitation, discussion, and diffusion of useful knowledge, afforded by the institutes must inevitably result in better farms, better houses, better cattle, better horses and greater happiness.

Hon. Adin Thayer, Treasurer, read his report for 1888 as follows:

RECEIPTS.

Cash on hand January, 1888	$4,870.63
Ticket sales at the Elmira State Fair,	15,258.25
From the State	8,000.00
Other sources	9,801.93
Total	$37,930.81

DISBURSEMENTS.

Premiums	$11,009 16
Fair expenses	11,345 83
Salaries	5,086.70
Institutes	4,961.46
Sundries	2,322.42
Cash on hand	3,185.24
Total	$37,930.81

The committee of 24,—three from each judicial district—to nominate officers, presented by its chairman, Gen. N. M. Curtis, the following unanimous report.

President, James Wood, Westchester; Vice-presidents, J. Pierrepont Morgan, Jos. H. Storm, F. D. Curtis, C. D. Smead, Jared Van Wagener, M. C. Remington and Col. H. Bowen; Corresponding Sec'y., J. S. Woodward; Recording Secretary, Seth Fenner; Treas. Adin Thayer; Executive Committee David Cossitt, J. F. Converse, F. C. Stevens, A. C. Chase, W. R. Richardson, F. O. Chamberlain, F. B. Redfield, James Hilton; Consulting Veterinary Surgeon, James Law; Consulting Entomologist, J. A. Lintner, all of whom were unanimously elected. Secretary Woodward, whose illness had prevented his attention to business for several weeks, was present and seemed to have regained his usual excellent health. At a meeting of the executive committee, it was determined that the annual exhibition should be held on September 12—19, the place to be either Albany, Poughkeepsie or Rochester.

(To be continued.)

The Poultry Yard.

ABOUT CAPONS.

DO THEY PAY? Well, I will tell you what I did as an experiment last year: In August, I bought 28 cockerels, that the party I purchased of said were hatched the last of May, so they were what I called late chickens. Their average weight, when I bought them, was about 2½ pounds. They were a mixed lot, the Plymouth Rock blood showing in them more strongly than any other, yet there was considerable Leghorn blood there, too. They were, however, regular mongrels, and what I called a "hard lot." I gave the farmer 25 cents each for them, and immediately gave them a pen by themselves, until I could free them of lice, which I very soon did with cynolina. The following week, after getting them in proper condition, I caponized the whole lot, not with the idea of making large capons of them, but to ascertain just how much profit could be made on such a lot. After they had been caponized, I simply treated them as I did all my growing chicks, giving them the same amount of feed and no more. As usual, they immediately began to grow very rapidly and seemed well contented in their new life. I was unfortunate enough to lose three by a door blowing against them. When the time arrived for shutting the fowls in for winter, I had 25 promising capons in this lot. In my regular lot I had over 200, but I called this my experimental lot.

To these 25 I gave a pen by themselves and simply fed them on corn, bone and water. There was no bother with nests, cooked feed, etc., with which hens must be furnished. It did not take me five minutes a day to attend to them. In January a party in Boston wrote to me for some capons. I concluded to kill this lot and send them to him. Although they were not fully grown, yet they were very plump and fat. I dressed the 25 and they weighed, when ready to ship, a little over 200 pounds, or an average of eight pounds each. I sold them for 28 cents a pound It cost me just 50 cents to keep each bird, from the time I bought him to the date of his death, making a total cost of 75 cents for each bird. The manure would well pay me for my time in caring for them. Eight times 28 are $2.24, less 75 cents, which leaves $1.49, net profit on each bird.

Now, what I did any man of intelligence and good common sense could do. Of course, the price I received was extra high, as the party wanted them right off. But I could have received in the open market that day 25 cents a pound, which would have left me a profit of a dollar a head. In my opinion the profit in raising capons is much larger than that in keeping hens, with less than half the trouble. With proper instruments one can perform the operation of caponizing with perfect success. GEORGE Q. DOW.

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

OTTAWA, Ont., January 10.—We are having the most extraordinary winter experienced here in 40 years. The Ottawa River is open opposite the city, where in ordinary seasons it would take a man a day at this time of the year with axe and shovel to cut a hole through the ice to get down to the water. Members of the canoe club went out for a spin the other day, to record the fact that such an unheard-of event occurred here on January 8. Snow has just commenced to fall, and it looks as if winter was now to set in in earnest. A. H.

NEW WESTMINSTER, B. Columbia, January 9.—The year has been a very kind one to us here on the Pacific coast. We have had a bountiful harvest of almost everything raised; we have got good prices for produce, compared with those obtained in the Western States. Timothy hay fetches from $12 to $18 a ton; wheat is worth from $30 to $40 a ton; oats $27 a ton; butter 30 cents a pound; cheese 20; eggs—fresh—50 cents a dozen; apples $1 per box of 50 pounds, and so on. R. S.

Delaware.

DOVER, Kent Co., January 7.—So far this has been one of the finest winters on record. We have had but one fall of snow, just enough to whiten the ground, and for the greater part of the time the weather has been just cool enough for work and we have had plenty of sunshine. There has been no stoppage in farm work. Farmers have improved the fine weather by hauling manure, cutting wood, pruning trees and doing various other odd jobs, and if the winter continues open we will be in good shape to start in the spring. Stock is doing finely. Public sales are unusually numerous, and, in spite of the low price of corn, the prices obtained for stock and implements are all that could be expected. Good cows bring from $25 to $45; horses from $25 to $175. Hay and other feeds are scarce and in demand at good prices. Of pork and beef the supply is fully up to the demand; price $7 per cwt. Not much corn is being marketed, as the price is so low—about 35 cents per bushel. Wheat looks well for the time of year, and as our crop is among the first to be marketed, farmers hope to realize a good price for this season's crop. Some fear that the open winter will cause peach buds to start so that if we have severe weather later the buds may be killed; but we hope not, for the peach crop is the crop we depend on for clear cash. The first of January is usually moving day here, and many farms change tenants, and nearly every farmer is called on to help some one to move. Many times have I taken a team and carried a load for a neighbor 20 miles or more gratis. Quite a lot of building is going on and most of the mechanics are employed. Wheat is selling at $1.10; corn, 35 cents; oats, 30; butter, 25; eggs, 20; chickens, 10 cents per pound; potatoes, 40 to 50 cents per bushel; wood, $3.00 per cord; coal, $5.75 to $6.25 per ton; hay $8 to $15 per ton. A. G. S.

Kansas.

PARSONS, Labette Co., January 11.—Our winter so far has been decidedly exceptionally mild. The temperature has not been lower than 14 degrees, and ice not more than three-quarters of an inch thick; still we have had hardly 24 hours through the winter without frost. December, January, and February, are our driest months, but this winter is exceptional, and once or twice a month we have had two or three inches. Corn is being gathered promptly and shipped to the cotton States as fast as it is gathered. The fact that we adjoin the cotton States is of very great value to us, as we get St. Louis and Chicago prices, or very nearly, on track here. We also ship eggs, butter, hay, apples, etc., to the Northern States. It is reported that wheat is looking very well all through Kansas, and that the acreage is four times that of any preceding season. The ice crop may reasonably be predicted as a failure, in spite of the uncertainty of weather predictions. J. B.

CHANUTE, Wilson County, January 10.—Crops in this county the past season were good. Wheat is good now; it is raised only on creek and river bottoms. Oats are rather light, the weather is too dry for them. Corn was mostly good, yet many fields were very poor, owing to drought. Flax was generally good. A tow mill has just been erected and is now running, buying up flax-straw, which is a great help to the farmers. After hauling the straw often many miles, they get $3 per ton for it. Potatoes were a poor crop. Farmers have to buy potatoes shipped in from Iowa. Fruit crops of all kinds were good. Millet hay was a very heavy crop; much is sown here for feed. Very little Timothy is grown here; but it is doing well where a good stand has been secured. We have had an open, or mild winter so far. We have had about six snow storms, commencing in November and lasting only for two or three days; some snow is on the ground now; but it will be gone soon; the weather does not remain cold longer than two or three days at a time. A great deal of plowing has been done; plows were running this week, but it is now too wet. F. J. C.

New York.

FORESTVILLE, Chautauqua Co., January 10.—The winter so far has been warm. It has rained for the past week almost constantly. If the spring should be cold and backward there will be lots of hungry stock, hay being scarce and high. A good many farmers will find it up-hill business to pull through. Many cattle are being sold at astonishingly low figures; some entire herds are going as low as $10 to $12 per head. Only a short time ago it was hard work to find a man that would plow a foot of ground in the fall; now it is safe to say that over two-thirds of the plowing is done in the fall or during open spells in the winter. How this way of turning up the soil to exposure will stand the test of frost, rain and sun remains to be seen. Potatoes are low—25 to 30 cents per bushel; eggs, 25 cents per dozen; butter is in good demand at 25 to 30 cents per pound. Almost all kinds of produce find a good market with us this season. C. H. F.

NEWARK, Wayne Co., January 14.—We had a few days of sleighing before Christmas; since then there has been no snow, but a great amount of rain. A very small acreage of winter wheat was sown; it is looking well. What promised to be a very prosperous season for farmers, proved quite to the contrary, owing to the decline in prices of potatoes, apples and onions at the time when it was possible for farmers to market them. There had been so much rain all through the fall, that cold weather came along before they were ready for it. The prices offered in the latter part of November were as follows: apples, $1 to $1.25; potatoes, 20 cents; onions, 20 to 30 cents. There are at least 50,000 bushels of potatoes in the hands of farmers in Wayne County. A few are being shipped, buyers paying 25 to 30 cents per bushel. The price of peppermint oil has declined from $2.75 to $2 15 per pound. This is usual at this season, buyers knowing that a good part of the oil is held by small farmers, who usually sell it to pay taxes, so that they can purchase the oil at less than the real market value—another illustration of the ways used to defraud the producer of what honestly belongs to him. Market prices are as follows: Wheat $1; barley, 60 to 85 cents; oats, 34 cents; potatoes 25 to 30 cents; butter and eggs 18 cents. W. H. K.

THE FARMERS' CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

BUCKWHEAT AS STOCK FEED; BEST STANDARD RATION FOR A MILCH COW; SEEDING TO GRASS.

O. B., Lombard, N. Y.,—1. Is buckwheat mixed with oats a wholesome and profitable feed for horses? What would be the proper proportion of each? 2. What would be the best proportion of each kind of feed in a mixture of wheat-bran, corn-meal and linseed-meal for milch cows? 3. In the reply to my question in a late RURAL, with regard to restoring fertility to a worn-out soil, it was presumed that this is a winter-wheat section; whereas it is not. I was advised to use 300 pounds of high-grade fertilizer to the acre; should I do this in spring and sow grass seed with some grain? What kind of grain would be the best for this purpose?

ANSWERED BY HENRY STEWART.

1. Buckwheat should be fed with caution because of its highly nitrogenous character. This is, however, more clearly indicated by practice than by science, and presents a case in which the scientific standards are to be taken with some allowance. For instance, the tables give the quantity of albuminoids in buckwheat as only nine per cent. and the nutritive ratio as one of albuminoids to 7½ of carbohydrates; but the bran of buckwheat contains 17 per cent. of albuminoids and its nutritive ratio is one to four. Now, this large quantity of albuminoids renders this grain too heating for horses, and in practice it produces inflammation of the skin and so much irritation that the animals will rub the hair off their necks, tails and other parts of the body; consequently, if buckwheat is fed, it would be better if mixed with corn, which contains a large excess of starch, which is a carbohydrate. One part of buckwheat, one of oats and three of corn make a very good feed for horses, when it is coarsely chopped. In fact, it is good for all kinds of stock, especially for pigs. I have fed it largely to horses, mules and colts with much advantage. 2. The best standard ration for a dairy cow, I think, is one part of wheat-bran and two parts of corn-meal, and of this four pounds may be given twice a day, morning and night, with dry hay at noon. Linseed-meal is not a desirable food for cows kept for butter. Cotton-seed meal is preferable, as it seems to give a desirable flavor, color and hardness to the butter, while linseed-meal does the opposite. I long ago abandoned the use of linseed-meal in the dairy. 3. There is no necessity for sowing any grain crop with grass seed; the grass and clover may be sown alone with the best results. If any spring grain is sown, oats are as good as any, and the grass and clover seeding is now done with this grain more than with any other.

SHOULDER LAMENESS—SWEENY OR SHOULDER SLIP IN A COLT.

H. R. C., Ann Arbor, Mich.—My four-year-old colt slipped on the ice while playing two years ago, and went lame for a while. I used a strong liniment for a short time. On breaking and working her, I find that she goes quite lame in the left front leg. It is difficult for her to back up, as she drags her foot. When stepping over a log, she swings her foot out sideways, from the body. Her foot and whole leg seem to be drying up. There is no fever in the foot. What causes the lameness, and what can be done for her?

ANSWERED BY DR. F. L. KILBORNE.

The lameness is in the shoulder. There is probably no trouble in the foot. You have given a very good description of shoulder lameness, but whether it is due to a sprain of the large tendon which plays over the point of the shoulder directly *in front*, or to a sprain of the muscle which fills the posterior cavity of the outside of the shoulder-blade, and plays over the *outer side* of the shoulder-joint, I cannot say positively. We will suppose the latter to be the case, this being the more common seat of sprain, causing what is commonly called *sweeny*. If our supposition is correct, the characteristic symptom will be a *rolling outward of the point of the shoulder*, readily seen by standing directly in front of the animal. There will also be a marked wasting of the muscles on the outer surface of the shoulder-blade, although the other muscles of the limb may be somewhat wasted from disuse.

Apply the following liniment to the wasting muscle every three days, until the skin becomes slightly blistered, then apply only once a week, but not so as to blister too severely. Equal parts of strong aqua ammonia and linseed or sweet oil, and one-eighth part oil of turpentine; shake well before using. If this fails to replace the wasted muscle, after a few weeks apply a cantharides blister—powdered cantharides, two drams, vaseline, one ounce, spirits of camphor, 12 drops. Follow the directions and precautions frequently given in these columns. In the absence of the characteristic symptom of sweeny, carefully examine the point of the shoulder in front, pressing firmly upon the center of the tendon and at each side. If tenderness is found apply the cantharides blister at once, and repeat as soon as the effect has nearly passed off. In this case it would be well to apply a high-heeled shoe. A rest of several weeks may be necessary to effect a recovery. In either case the colt should be put to work gradually after recovery, and not be put to the plow until the shoulder is well hardened by other work.

ORNAMENTAL HEDGE PLANTS.

"*Snowdrop*," *Oswego County, N. Y.*—Having bought a small farm, I am desirous of making it attractive to my wife and children by surrounding the house with a flowering evergreen hedge, using the inclosure for a flower garden. Will the RURAL assist me in selecting varieties of evergreens that would furnish bloom from early spring until late fall? Where could I obtain the plants and how far apart ought they to be set out? My soil is a sandy loam.

ANS.—You cannot have such a selection in any Northern State. Of evergreen plants for hedges, we have plenty; for instance, Norway Spruce, White Spruce, Colorado Blue Spruce, Hemlock Spruce (in situations congenial to it) and American Arbor-vitæ; but not one of these is what is familiarly known as a "flowering" shrub or tree. Hardy rhododendrons and Mountain Laurel (Kalmia latifolia) are handsome evergreens and lovely blooming shrubs, but they bloom in early summer, and neither is adapted for hedge-work. If you insist on having an evergreen hedge, try one of the hedge plants mentioned above and restrict it to hedge proportions; then within the inclosure, as taste and circumstances may advise, use a goodly variety of such handsome flowering shrubs as forsythias, spiræas, deutzias, deciduous magnolias, rhododendrons, azaleas, lilacs, mock-oranges, snowballs, hydrangeas, althæas and the like. The Japan quince, of which we have pure white, pink, and crimson-scarlet-flowered varieties, makes a really pretty division ornamental hedge, but should not be pruned in hard—merely enough to keep it within bounds and orderly. Hedges made up of mixed shrubs are not to be recommended. The proper distance apart between plants in the hedge row depends on many things; but more especially on the sort of plant selected, the object in view, whether it is to be a stiff or flowering ornamental hedge, and also whether it is meant to act as a fence against cattle. Don't use a hedge of any kind nowadays as a cattle fence. If it is to be a stiff hedge three feet apart will be close enough, and four feet after a few years, will be better; but if it is to be a flowing, flowering ornamental hedge, four to six feet will be about right. The plants can be got from Ellwanger & Barry, the Storrs & Harrison Co., or from any of the other nurserymen who advertise in the RURAL.

TREATMENT OF BONES AND FLESH FOR FERTILIZING PURPOSES.

J. M. W., St. Mary's, Pa.—1. How long must bones be steamed under a pressure of 80 pounds to reduce them to a semi-liquid mass? 2. How much plaster should be composted with every 100 pounds of flesh to fix all the ammonia?

ANSWERED BY W. H. BOWKER.

1. I do not think any steaming of bones, however high the pressure may be, will reduce them to a semi-liquid mass. The steaming of bone breaks down its animal texture, and throws out the grease, which rises to the top and is drawn off. The bone which is broken down is taken out at the bottom and pressed, in order to extract the water and what additional grease there may be, and then the mass, which is in a pasty condition, is placed in large revolving driers, and dried to a fine, dry powder. In some cases I presume it is taken from the tanks and pressed and then spread out in thin layers on the floor, and dried in this way. Bone, to keep well, should be dried down to ten per cent. moisture and below. 2. I suppose the flesh in this case to be raw, and I have had no experience in mixing plaster with this article. I should say the better way would be to tank it the same as the bone is tanked, under 80 pounds pressure of steam, in order to get out the grease which is of no value as a fertilizer, and then press it in order to extract the moisture, and then dry it by spreading it out in thin layers or in a revolving drier. If the latter course is not practicable, plaster might be mixed through it, and put over it as a cover in sufficient quantity to keep down all odor, and how much plaster that would require experience alone can tell; but I should say that a layer three or four inches deep would accomplish that end.

ABOUT APPLES.

C. P., Dawn Mills, Ont., Canada.—1. What kind of apples are Wolf River, Scott's Winter, and Mann? 2. Are budded young trees better than those that are root-grafted; if so, why?

ANS.—1. Wolf River is a large late fall apple, which originated near the river in Wisconsin for which it is named. It very closely resembles the Alexander, and is supposed to be a seedling of that variety, but the tree is less hardy. Scott's Winter is a long-keeping red apple of medium size, which originated in Orleans County, Vt., near the shores of lake Memphremagog. It is hard, sour and unfit for eating uncooked until spring; when the flesh softens, and the flavor becomes milder, brisk and spicy. It is the longest keeper yet known among the American iron-clad varities. The tree is vigorous, productive and an early bearer, but makes a bushy head, requiring considerable pruning. Mann is a long-keeping, green-skinned apple of above medium size, and not more than fair quality. The tree is vigorous, and productive, and the variety is profitable to grow. It has been called an "iron-clad," and advertised as being "as hardy as Duchess of Oldenburg," but in fact it it but little if any hardier than Northern Spy. It kills to the snow line in winters where Wealthy and Scott's Winter are uninjured. 2. Budded trees are in no way better than those grown from root-grafts; but a new or scarce variety can be more rapidly increased by budding than by root-grafting, as but a single bud is required for the former, while not less than two buds, and, more commonly, three or four are used for the latter.

STIFLE LAMENESS IN A COLT.

J. B. H., Friendship, N. Y.—My seven-months-old colt became lame about two months ago in the right stifle joint, where there is the appearance of a bruise. At first there was a gathering on the outside of the joint, and I lanced it, and drew off the pus; but it gathered again. I have blistered it a number of times since. There seem to be a good many sacs of pus on the inside of the joint as well as on or near the cap. I have used chiefly hot applications. There is but little heat, though the colt is very lame. When I hold my hand on the joint and the animal moves on that limb, I can feel the joint slip into place. I am now using astringent applications. The colt is in good health and growing nicely. What shall I do for him?

ANS.—The applications you have used are good; but we would not advise you to open any sacs on or near a joint unless you are familiar with the anatomy of the part, because of the danger of opening into the joint or a synovial sac that might be troublesome to close. If the present swellings appear to contain liquid, their contents may be properly drawn off with a small trocar and cannula or an aspirator. Try bathing once daily with a solution of acetate of lead—three drams in each quart of water. If this fails, after a few weeks, apply a liniment of equal parts of strong aqua ammonia and sweet oil. Shake well before using, and apply once daily until the skin is thickened and quite well blistered. Then cease, to be again applied if necessary when the effects of the first applications have nearly passed off. You could scarcely have actually blistered the joint a number of times in the two months since the colt was injured, because a good blister usually requires at least four weeks for the effects to disappear.

STEELE'S RED WINTER APPLE.

L. A. E., East Randolph, Vt.—Can the RURAL give me any information about Steele's Red Winter apple? We have a few trees in this vicinity, that are beginning to bear. The cions were obtained a few years ago from Michigan. It appears to be a fine and very promising apple.

ANS.—Downing makes the Steele's Red Winter a synonym of the Baldwin, on page 85 of the Fruits and Fruit Trees of America. The Baldwin is so well known that there is no need of describing it here. Again, on page 324, he makes it a synonym of the Red Canada, which in 1869 (when the work was published) was much grown in Connecticut and Massachusetts, and succeeded well in Western New York, Ohio and Michigan. Tree thrifty, but of slender growth; very productive, young wood brownish-olive. Fruit medium, oblate, inclining to conic. Skin yellow, mostly splashed with a deep red or crimson; some striped or splashed on the sunny side, and thickly sprinkled with gray, and sometimes gree ish dots. Stalk short, inserted in a broad, deep cavity. Calyx closed. Segments long, in a small narrow somewhat irregular basin. Core small, close. Flesh white, tender, crisp, abounding with a brisk refreshing juice. Very good to best. Season January to May. Is this the apple about which our friend inquires? J. J. Thomas also, in his American Fruit Culturist, makes Steele's Red Winter a synonym of the Baldwin and Red Canada.

CABBAGES AND CAULIFLOWERS "MIXING."

Several Subscribers.—In the recent article on cauliflowers grown on Puget Sound, nothing is said about the danger of the seed being mixed with that of the cabbage family. What about this?

ANSWERED BY H. A. MARCH.

The cabbage and cauliflower cross very readily, and great care must be taken to prevent crossing, as the bees carry the pollen from the cabbage to the cauliflower blossoms. But we raise seed the same year we raise the heads, and our cauliflower blooms don't appear until the middle of July, so that the cabbage family have mostly gone out of bloom by that time. But to make things sure, the boys are sent to every cabbage patch where seed is raised, within three miles of us, and with a pair of shears they nip every late bud and blossom to be found. That gives us assurance of pure seed. How about the different kinds of cauliflower mixing? We raise but one variety the same year, or different strains of the same variety.

Miscellaneous.

F. H. B, Black Hawk, Colorado.—You can get bone mills of various sizes from Wilson Bros., Easton, Pa.

J. J. W., Honeoye, Ont. Co., N. Y.—Is the Downing Mulberry hardy?

ANS.—It is not reliable in any severer climate than that of N. Y. City. It is grown somewhat north with more or less success.

W. H. M., Marshalltown, Iowa.—Where can I get a potato planter that will do good work?

ANS.—Write the Aspinwall Manufacturing Co., Three Rivers, Mich. See their advertisement in our columns.

W. B. W., Leominster, Mass.—1. About how many two-eyed seed-pieces would I be likely to get from one barrel of the Rural No. 2 potato? 2. Would it be safe for me to put barrels of such seed in cold storage in the city?

ANS.—1. We should guess about 900. 2. Yes, it would be safe.

R. B., St. Henry of Montreal, Canada.—Does California-grown onion seed produce as good a crop as Eastern-grown seed? There is quite a difference in the price.

ANS.—Yes, the stock being equal in quality, seed grown in California produces as good onions as Eastern-grown seed.

J. W. L., Rockford, Ill.—Which are the most profitable varieties of potatoes for market, to be grown in a light soil? Where can they be obtained?

ANS.—Early Ohio, Pearl of Savoy, Early Puritan, White Star, Empire State, Rural Blush, White Elephant or Late Beauty of Hebron. Please see the seedsmen's catalogues soon to be noticed, to ascertain where the various kinds can be obtained.

Subscriber.—Many of the writers in the "meat" articles say they put ashes in the water in which the hogs are scalded; why is this done? What chemical action is induced by the ashes?

ANS.—Any alkali has the effect, when applied to an animal's skin, of loosening the hair. Thus ashes (potash), or lime paste, spread on the fleshy side of a hide, very soon loosens the hair or wool, and tanners loosen the hair by steeping the hides in lime water. Hence the addition of ashes to the hot water —180° is the right temperature—helps to loosen the hair and facilitate the cleaning of the skin.

J. H. S., Middlebury, Ohio.—I have received the inclosed circular in regard to the Tree Currant, in which the nurseryman, among other things, claims that it never suckers or sprouts, and that worms never eat the leaves. He also claims that the

Champion Gooseberry is very large and that it never suckers. He gives the names of a number of grapes the fruit of which, he says, will keep fresh and plump in an ordinary cellar, if put into a shallow box until it is quite full, even if no cover is put over them. Will they do so?

ANS.—We have no faith in the claims made. Any currant can be easily trained to a tree form. Or any variety may be grafted on such tall-growing stocks as the Missouri Currant. "Cutting out the buds," etc., will not prevent sprouting. Currant worms do not attack black currants. The Champion, as we have it (J. M. Ogle), is of medium size only. No; the grapes will *not* keep as represented. The varieties will be found in most nurserymen's catalogues.

DISCUSSION.

DOES "FARMING PAY."

E. T., EDWARDSVILLE, KANS.—It seems to me that the Parson misses the point of the parrot's remark, on January 15, R. N.-Y. The bird is talking about the "pay" of farming, not the ministerial approval of it. The farmer finds "honorable mention" to be a poor salve for a shrunken purse, as it is but a poor and unsatisfactory return to Mr. Leary for the loss of his raft, that he is in high favor at the Hydrographic Office. One may be a "conservator" of the public good and a useful citizen generally, and yet find his business in a poor way. The parrot is speaking about the business part of farming. "The farmer feeds the world," it is true; but he is not doing it primarily for applause; that's a sort of "pay" that doesn't pay very well—pay debts and taxes, for instance. The sleek citizen's "well done!" furnishes no legal-tender for the hired man.

John Cheeston appears to be a little off, also. He offers himself in testimony, but he is not a competent witness, not being a representative farmer. The parrot makes no charge against butter-making as a remunerative industry, or against sheep-growing, or cattle-raising, or market-gardening, or flower-culture, or the production of fruits, potatoes, seeds, nursery stock, grain, hay or celery; and no doubt would readily admit the profitableness of any one of them when pursued persistently and intelligently under favorable conditions, as a main issue, like Cheeston's butter-making. But such "special" culture is not farming in the common acceptance of the word. It is the New Gospel of Agriculture. As it comes in, I have hope that farming will go out, and the parrot change his tune.

A NEW FARM FENCE.

E. D., WOODLAND, MICH.—I will describe for the benefit of others a fence we are trying and which promises better than anything I have ever seen before. It is made of ten smooth steel wires running horizontally like the warp of cloth, and connected by cross wires a foot apart. The space between the two lower wires is three and one half inches, and the distance gradually increases till the upper space is twelve inches. The whole is 58 inches high, and when just two inches above the ground makes a five-feet fence. All the horizontal wires are number nine except the top and bottom ones, which are much heavier, and the cross wires are of number eleven. The horizontal wires are twisted spirally before the fence is woven, so that they resemble in the fence, coiled springs drawn out, and there is a constant tendency to shorten. This, it is claimed, keeps the fence tight in warm weather and adds to its strength at all times. The posts need not be closer than two rods, and we had a stretch of 60 feet with a sag of less than two inches. One horse has tried a charge upon it, and picked himself up uninjured, but wiser. It has all the advantages of barbed wire without its dangers. It is put in place for seventy-five cents a rod, and while I am not interested in any way in its sale, I believe it to be the cheapest good fence I know of.

ABOUT THE NATIONAL WOMEN'S POTATO CONTEST.

H. B. M., VERMILLION, KANS.—I would like to have it definitely stated in the RURAL whether in the Potato Contest women contestants will have to contend against masculine labor beyond plowing the ground and digging the crop; and also as to how the prizes are to be distributed. I quite appreciate the RURAL'S good intentions; but want to learn on what business basis the contest is to be conducted. What is a merchantable potato?

R. N.-Y. We are in favor of having the women (bless them!) do all the work except the preparatory plowing or digging, harvesting and application of fertilizers or manure. All this they *may* do if they choose, and the doing of it should count a point or so with the judges. The R. N.-Y. is open to any suggestion or advice that may be given. We shall hope to fix upon a rational basis of action that will please all of our lady friends not disposed to be cranky. How would five ounces answer as the minimum of a merchantable potato?

WHAT WAS THE MATTER WITH THE CORNFIELD?

D. C. L, CRANBERRY, N. J.—On page 37, S. W. H. asks this question and goes on to show that the trouble lay in not cutting some of the corn roots. Now the land about Metuchen, is a heavy clay soil. The fact that the corn did not ripen I should attribute to one or two causes, and not to the fact that the roots were not cut off with the plow, as S. W. H. supposes, when the corn was in the silk. I would prosecute a man for damage, if I could, if he plowed my corn after it was coming in silk. The time of planting may have been late, and the season was very wet, so that it kept corn growing and so full of sap that it could not ripen. Large quantities of corn with us, gathered as late as November, were not fit to crib, and I expect to hear of a large amount that will have molded when the owners come to shell it.

"WITCHING" FOR WATER AGAIN.

U. S. S., NEW HARTFORD, NEW YORK.—In reply to T. H. T., of Alexandria, Dakota, here is what I have heard my father say about "witching" for water:—About 30 years ago he was going to dig a well, and sent for a "water witch" to locate the spring, which he did by holding a crotched stick in both hands, so that the end formed by the two twigs would point directly ahead of him, at right angles with the course of the spring, which he said was to the north in that locality. As he passed over the supposed stream, the crotched stick would turn in his hands and point toward it. My father dug where the "witch" said the spring had its course, and found water just as he had said—10 feet below the surface. The professional said the twigs must be cut from a tree that bore fruit with stones, as peach, plum, etc. The twig would not point to the water for my father. What it is, is more than I can tell.

CURE FOR AN EGG EATER.

J. L. H., WATKINS, N. Y.—In R. N.-Y., No.2,032 there is a cut of a very pretty pullet, and from her looks I take it that it would not take much to get her to break eggs. Now all poultry writers whom I have read, when treating on the subject of "hens eating eggs," give no satisfactory method of breaking them of the habit, excepting to cut their heads off, and even P. H. Jacobs on the same page on which the cut of the pullet appears, speaking on this subject, gives no way to prevent it. A hen with an ordinary beak cannot break an egg by pecking it, but a hen with a beak that has become pointed, like the one in the RURAL'S cut, can break an egg by pecking it a few times. That being the case, what could be a reasonable remedy? Blunt her beak. Simply take a jackknife and clip off a small piece of her upper bill.

E. A. F., HANCOCK, VT.—In reading A Tale of Toads in December 29th RURAL, I was reminded of a nearly similar experience with the same batrachians and also with a striped snake. On looking my bees over one morning, I noticed one swarm that seemed to be readier for war than work. The hive was a Langstroth and set on the ground, with a board in front to prevent the grass from growing up in the way. On removing the board, to my surprise, there, coiled up, was a striped snake, which left before I could kill it. I left, but soon returned to find the snake on the alighting board with his head to the entrance. I struck at it but missed. About an hour later I found it in the same place again and I killed it.

J. N. J., HOLLAND PATENT, N. Y.,—The RURAL'S answer to A. F. H., Dansville, N.Y., in a late issue in regard to feeding beans to sheep, I think is misleading. It is said that sheep will not eat beans whole. My experience in feeding sheep has been right to the contrary; they eat them with avidity and most sheep are very fond of them. In a flock of 80 not more than two or three refuse them with me. Beans make an excellent food for them; but care must be taken not to feed too heavily at first; ground beans would, I presume, be the best.

E. M., ECHO PLACE, ONTARIO, CANADA.—What does the editor of the R. N.-Y. think of Agnes as a good name for his best seed potato?

R. N.-Y.—We certainly think it a good one, especially as a woman by that name has had as much to do with the RURAL'S originations as the editor himself. It was thought best, however, to identify the potatoes with the RURAL NEW-YORKER.

I. Y., PONTIAC, ILL.—I am in favor of Mr. Woodward for Commissioner of Agriculture. I have been reporter or correspondent to the Department for the past eight years, and I have no fault to find with Mr. Colman; but we may expect a change. If we cannot have Mr. Woodward, give us Prof. Morrow of this State, although we want him to continue in the place he now occupies: for he has been a great help to the farmers around here.

What Others Say.

MANAGEMENT OF CREAM.—T. D. Curtis, in the Prairie Farmer, says that there is a good deal of discussion going on now, in the papers, in regard to the best manner of ripening cream for churning. All agree that cream should be ripened, but few seem to understand precisely what ripening is. But all concur in giving age to the cream, and nearly all assume that some sort of souring is necessary. John Boyd, of Elmhurst, Illinois, aims to exclude the air from both his milk and cream, and to develop only one acid, which we understand to be lactic. His idea is that this alone gives the flavor so much desired by connoisseurs in butter, and that exposure to the air develops other acids, which interfere with the lactic acid flavor, and in so much injure the quality of the butter. Mr Boyd is consistent, at least. It may be questioned whether lactic acid imparts the true butter flavor; but, if it does, it cannot be denied that the development of other acids must injure the flavor imparted by this one. Quick souring, to get ahead of other kinds of fermentation, is what he aims at. To secure this quick fermentation, he prepares what he calls "a starter" of skimmed milk. He prefers, according to his theory, skimmed milk that has parted with its cream by submerging, as it is deemed important by him to exclude the air as soon and as much as possible. This skimmed milk is still excluded from the air, and when it has reached the desired acidity, a certain portion is added to his batch of new cream, and thoroughly incorporated with it. This cream is also excluded from the air, and he does not even permit it to be stirred for the purpose of equalizing the temperature and degree of acidity, lest it be too much exposed to the air thereby. He churns at the ordinary temperature, when the cream is properly ripened, or has reached the requisite degree of acidity, by pouring it into a tight box-churn. Thus, from first to last, Mr. Boyd aims to exclude the air as much as possible, and to develop only one acid—the lactic. He admits that he has not yet succeeded to his satisfaction, but is still experimenting, in the hope of reaching definite results. Whether right or wrong in theory, he is making a laudable effort to solve one of the yet unsolved problems in butter-making. Are these experiments and opinions of no value? asks Mr. Curtis. Perhaps there are more ways than one of developing flavor, and we may yet be able to take our choice of flavors when we buy butter. We have that choice now, but most of the flavors are bad.

THE NATIONAL WOOL GROWERS' CONVENTION.—The Convention of members of the National and State Wool Growers' Associations met at Washington last week. Thirteen States and Territories were represented. Resolutions were adopted demanding that the duties on wool and woolen and worsted goods be adjusted so as to secure the American market to American wool growers; protesting against some of the provisions of the Senate bill as inadequate and unjust to wool growers; providing for a Committee to prepare a schedule of tariff duties on wool to be presented to the Senate for adoption, and calling for an early session of Congress. On Saturday a delegation called on the Senate Finance Committee and presented its schedule. This proposes to divide wool into three classes—clothing, combing and carpet. The duty on wools of the first and second class shall be 11 cents per pound, including hair of the alpaca, goat, camel, llama and other like animals. Wools of the third class, valued at 12 cents a pound or less, shall pay three cents duty; valued at over 12 cents, six cents a pound; prepared wool shall pay extra duty, according to the character of the preparation. Wastes, composed wholly or in part of wool or worsteds, 30 cents a pound; woolen rags, shoddy, etc., 20 cents a pound. Wools dyed or otherwise prepared beyond scouring or washing shall pay the same duty as manufactures of wool.

The Senate will consider the wool schedule in the bill this week, but it is not deemed probable that any material change will be recommended by the committee. The wool manufacturers want lower duties on certain classes of wools, especially on carpet wool, and Western wool growers say that if this is granted, they will insist on free wool and free woolens.

CORN AS STOCK FEED.—The Special Commissioner sent to this country by the London Mark Lane Express, says, in that Journal, that he cannot help thinking how much better it would be for the stock-breeding interests of America if more roots were grown to feed in conjunction with the more heating and pampering ingredients of corn and cake. Indian corn, fed judiciously along with grass or succulent food of any kind, is productive of good effects. But it is not the food to use for growing animals, because of its insufficiency of mineral constituents, such as phosphate of lime, magnesia, etc. It has a ratio of only 8 6 carbonaceous to 1 of nitrogenous food and is thus peculiarly rich in the heating and fattening properties. As a food for full-grown stock it is a powerful auxiliary, but it is so poor (having only some 2.1 per cent. of ash) as to be almost destitute of muscle-forming and bone-building materials. Whether American breeders can produce as good cattle as English breeders, therefore, Mr. McDonald believes to be more a question of feeding than of climate or anything else.

SPICE.

OUR respected friend Dr. Hoskins, says, in our respected contemporary Garden and Forest, speaking of winter apples—

"The one apple which should not be omitted, is Hunt's Russet, sometimes called 'The Golden Russet of Massachusetts.' If there is a best apple, surely we have it here. (Downing has it under both names, seemingly unaware of the fact.) It originated in Concord, the home of patriotism, poetry, and philosophy. Not a large fruit, rather small indeed, it illustrates the saying that the best things are put up in small packages. It is thinly russeted on a yellow ground, with a bright, rich red cheek, with a fine-grained, yellowish flesh, with a tender, juicy, very rich, aromatic, and briskly (but not excessively) acid taste, and altogether, Hunt's Russet is an apple to offer to our most highly valued friends, in our most friendly mood."

The American Pomological Society double-stars this apple for Massachusetts only and pronounces it "very good."

THE Westfield Seek-no-Further of Connecticut is a market and dessert apple of a high grade, successful over a broad extent of country. It is grown westward to Michigan, and the finest specimens of the variety that Dr. Hoskins has seen on exhibition have been from that State. It is an apple very even in size, a thing important in barrel-fruit. The peculiar Pearmain flavor noted by Downing, makes the Westfield very popular with old-fashioned people

YELLOW BELLFLOWER is an apple hard to surpass when in perfection, and prime fruit of this variety always fetches a high price in Boston. But it is very particular in its choice of locality. Dr. Hoskins has never seen first-class Bellflowers grown anywhere except upon the banks of, or near to, some large river, like the Connecticut or the Kennebec. When suited in location, no apple yields better or finer fruit. Maine-grown Bellflowers keep as well as Baldwins, though it is reckoned an early winter sort

THE catalogue of the A. P. S. double-stars it for Nova Scotia, Ohio, West Virginia and California, and single-stars it for 20 other States

SUBSCRIBERS to the R. N.-Y. may order our Specials sent to any of their friends. We will promptly obey such orders

THE London Garden illustrates and describes a new Kœlreuteria, K. bipinnata. It is a robust-growing tree about 60 feet high. The leaves are 24 inches broad at the base, regularly bipinnate; leaflets leathery. The flowers resemble those of K. paniculata, being yellow. It grows wild in Central Yunnum at an altitude of 5,850 feet. It blooms in late July

WE shall make an effort to procure of our subscribers half-a-dozen of the largest and shapeliest R. N.-Y. No. 2 potatoes grown by them

THE best of the new and old vegetables for both field and garden culture by our best practical writers. *This will be the subject of our next Special.*

WHAT new kinds of grapes, strawberries, blackberries, currants, etc, are improvements over older varieties, will be the subject of the next thereafter

PROF. HENRY of the Wisconsin Agricultural College, says that it is not necessary to fill the silo slowly. A small silo was filled to the depth of 13 feet in one day, and the si-

age was of excellent quality. The partition is useless and a nuisance. The best silage has no unpleasant odor. Silage has not proved a good f.od for pigs.....

HORNS AND MILK.—Prof. Law, of Cornell, says, in the Weekly Press, that the growth of the horns coincides with an abundance of rich blood, thus making the same requisites for growth of horn and for flow of milk. But it is folly to say that the removal of horns will stop the forming of an abundance of rich milk. When the horn is not required to be nourished there should be more blood for the secretion of milk. The horn itself contains no nerves and cannot exert a refl-x influence. Horn is made of gelatine, the same substance making hair and a part of the bones and sinews. Large bones and sinews are certainly not required for good dairy cattle. Nor is long hair a requisite of a good cow. In autumn and winter is the greatest growth of hair, but the greatest flow of milk is in the spring .....

A PAPER called the Agricultural Epitomist, published at Indianapolis., Ind. byJ. A. Everett & Co., prints the following:

"Some paid-for (at 20 cents a line) New York dailies say of the RURAL NEW-YORKER: 'It has done more to promote the interests of agriculture in its experiment grounds than all the experiment stations put together.' We do not begin to believe any such stuff."

The same paper also publishes the following:

"Carman, of the RURAL NEW YORKER, to use a Western expression, is a 'slick' citizen, when it comes to a potato contest. The turning point in the same seems to be to 'blow the horn' of his No. 2 potato."....

IN introducing the novelties originating at the Rural Grounds, whether they be potatoes, cross-bred wheats, hybrids between rye and wheat, hybrid roses, blackberry hybrids, or anything else, the R. N.-Y. looks for compensation in but one way, viz., an appreciation on the part of the people of its earnest endeavors to promote the interests of agriculture and horticulture.

The RURAL has shown that J. A. Everett & Co., advertised and sold the Armstrong or Landreth wheat as "Martin's Amber;" that they advertised and sold Russian White Oats under the name of "Yankee Prolific," and that during the past year they have falsely assumed to be the head quarters for the new and promising variety of wheat called "Golden Cross." Possibly in this fact may be found the animus which prompted the falsehoods above quoted.....

IN renewing your subscriptions, readers of the R. N.-Y., add a line or so telling us wherein you conspicuously failed or were successful last year; if you have any new ideas, tell us what they are; if you would have the R. N.-Y. talk less or more upon any subject, let us know about it. So shall we help one another.....

AN engraving in a late bulletin N. C. Experiment Station., gives illustrations from nature of Lucerne or Alfalfa plants. The report says that most of the root system was within 10 inches of the surface. The plot was two years old. The crop was cut three times last season, and on Dec. 1, was in good shape to give a cutting on March 1. The soil is a compact, red clay. It was so hard that a spade could make no impression on the ground, and a mattock had to be used to loosen the soil, even on the surface. Under the most favorable circumstances a well established Lucerne meadow will yield 15 to 20 tons of green fodder, equal to four or five tons of dry hay, per acre. Under such circumstances the duration of the meadow is indefinite, but under favorable conditions it will yield well for 10 or 15 years.....

THERE seems to be an irreconcilable difference between farmers as to the best way of sowing Lucerne seed. Some declare for drills 14 to 18 inches apart; others are as strongly in favor of broadcast seeding. Upon one point, however, all authorities agree, namely, the absolute necessity of having the seed-bed finely pulverized and in good heart. For those who can afford to weed the crop three or four times during the growing season, the safest plan is to sow in drills 14 inches apart and cultivate with a hoe, The plants should be allowed to ripen seed in the fall and the spaces between the drills should be seeded down. Lucerne does not sucker from the roots, and hence can be increased only from seed. If seed is sown in drills; use 15 pounds to 18 pounds per acre; if broadcast, use 25 pounds to 30 pounds—the larger amount on the poorer land.....

THE North Carolina report says that Lucerne seed will not sprout if covered deeper than a quarter of an inch. The R. N.-Y. thinks this must be a mistake. The seed of the Rural plot of a quarter-acre was drilled in at least half-an-inch and the stand was very good The greatest care should be exercised in selecting seed. The vitality of Lucerne seed is so low that seed over one year old is scarcely worth sowing.....

IN sending lists of trees, whether fruit or ornamental, to nurserymen, specify that you want small, young trees. Remember what such men as Robert Douglas, Pres. Lyon and Prof. Budd, have said on this important subject. As a rule, if you plant a spruce that is only a foot high, in 10 years you will have a finer, more symmetrical tree than if you had planted a spruce four feet or more high. The same principle is good for fruit trees....

PROF. J. L. BUDD agrees with Pres. Lyon that the planter of one-year-old pear trees will, when they are at the usual age of bearing, have a healthier, more productive and profitable plantation than if he planted older trees. Beyond all shadow of doubt this is true, as it is almost impossible to secure decent roots on two or three-year-old pear trees if worked on pear stocks. Prof. Budd says, in the Farmers' Review, that he wishes also to extend this idea and include the cherry and plum. His experience during the past 25 years favors the idea that, with the fair culture the orchard fruits need during the first stages of growth, a larger proportion of the one-year-old cherry or plum trees will live and make thrifty growth the first season, and that at the end of three years they will make larger, handsomer and healthier trees than will two or three-year olds set at the same time.

PROF BUDD further states that he has found the cherry quite as easy to graft as the apple. The main requisite in top-working is really to have the cell structure of stock and cion in the same condition.

On this same principle we can graft the cherry when the buds have started in the spring if we cut the cions as needed from trees about equally started.

To illustrate: He was obliged to take up some valuable cherry trees of bearing size last spring in the college grounds (Ames, Iowa). Not wishing to lose the varieties, he cut off every cion when the buds had begun to elongate and show the green point of the embryo leaves. He had some seedlings about equally started upon which they were at once grafted, and at the close of the season it was hard to find a vacancy in the two nursery rows in which they were planted, but they did not make as good growth as those grafted early in the winter and kept in a cold cellar.

IN speaking of the present system of education—now happily passing away for a better one—the Popular Science Monthly says that we want one man to be always thinking, and the other to be always working; and we call one a gentleman and the other an operative; whereas, the working man ought often to be thinking, and the thinker often to be working, and both to be gentlemen in the best sense. As it is, we make both ungentle, the one envying, the other despising the other; and the mass of society is made up of morbid, unhealthy thinkers and miserable workers. It is only by labor that thought can be made happy. The professions should be more liberal, and there should be less pride felt in peculiarity of employment, and more in the excellence of achievement.....

DIRECT.

——N. Y. HERALD: "Canada has a public debt of over two hundred millions.

"If Uncle Sam marries this maiden it will surely be for love, not for money.

"Afterthought—If Miss Canada should say "'Yes!' when Uncle Sam 'pops,' would she be influenced by his strong box?

"Well, let that pass. She might promise to be a 'sister' to him, and for the present we ought to be satisfied."

——ORANGE COUNTY FARMER: "At any rate, we do not want Forrest K. Moreland or Dr. Loring for Commissioner of Agriculture. To appoint either would be to slap every reputable farmer in the country, full in the face."

——D. B. WEIR, IN ORCHARD AND GARDEN: "The late Arthur Byrant found the pecan growing wild in the valley of the Illinois, 60 miles above Peoria. At my old home, Lacon, Illinois, 30 miles north of Peoria, there were great trees of it, some over three feet through, and 80 feet high, that gave abundant and regular crops of nuts. These nuts, from some trees, were larger than any I ever saw from the South and were fine in quality,"

——" MR. PEEK, of Georgia, thinks that nursery-grown pecan trees, two or three years old, are of a very suitable size for planting in groves, and if properly formed, can be transplanted about as successfully as any fruit tree of the same age."

——HUSBANDMAN: "Dr. Collier a man of brains, and of truth as well, said, years ago, that sugar could be produced at a cost of a cent a pound and he was derided as a lunatic; but the foremost scientists of the age, in the light of practical results, say, now, that the cost need not exceed three-fourths of a cent a pound and the work is growing n practical reality."

——PROF. HENRY: "Uncut corn-stalks make silage of the finest quality, but the labor of getting them out of the silo is too great. For a silo 16 feet deep, studs 2x9 inches should be used, and these should be bridged a few feet from the ground to prevent springing."

——GOV. HOARD, before the Dairymen's Association of Ontario: "Our people are clamoring, 'Why don't you give us some cheese we can eat?' I don't think there is a set of people on God's green earth who are so stupid as cheesemen. Now you have got it square in the teeth. I never saw a set of men that when a man asked for bread would give him a stone, and then damn him because he didn't like stones, as cheesemen do with respect to this question of home demand,"

——J. J. H. GREGORY, in Farm and Home: "When we have a lot of cabbages that do not form hard heads, or immature cabbages that have just begun to turn the leaves in roundly, we plow a furrow seven inches deep and jam the roots of the cabbages downward as close as they will stand, firming the earth about the roots and throwing what is dug out of the trench and more over the cabbages, piling it directly upon them to the depth of one foot. It doesn't seem possible, but it is true that cabbages treated in this way will to a large per cent. head up finely and be fit for market in the spring. The good thing about this process of winter growing is that this cheap class of vegetables that hardly pays for harvesting in the fall, shows round profits when dug out of its burrow in the spring when cabbage is high."

——RURAL CANADIAN. "The cherry is about the only fruit tree which can be recommended for shade in pastures along road-sides, as the hardy varieties of cherries are not affected by the trampling of stock or passing of vehicles, which would prove injurious to most other fruit trees."

——S. S. TIMES. "Conservatism is all very well—when it is well; but there are times when the truest conservatism is in smashing things. If you want to save the meat of an egg, you must break the shell. There is no getting at the kernel without cracking the nut."

——N. E. FARMER "A sheepman claimed to have an offer of $500 for a ram, which in two years from the time he was glad to sell for $50. Another sheepman claimed to sell a ram for $1,500, and the check came for that amount, but part of the money was paid back on the sly. Money is sometimes hired for only a day or two, and for the purpose of deceiving some one by showing it. The following is a case in point: A young man hired $100 Saturday night to be paid Monday morning, for which he paid a good bonus, to show to his girl on Sunday night as his own. Girls should be smart enough when a man shows them money to find out whose it is."

——WESTERN RURAL: "Weld & Co., nurserymen of Lyndonville, N. Y., is a firm without means and without honor. It does not pay its bills and they cannot be collected."

——PROF. LAZENBY IN OHIO FARMER. "When will farmers and others learn that life is not for work, but that work is for life? If our work adds nothing to the completeness of our lives, if it makes us no braver or better, if it contributes nothing to our well-being and happiness, surely such labor is in vain."

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

Trees, Seeds and Plants.

If you want the best Garden you have ever had, you must sow

MAULE'S SEEDS.

There is no question but that Maule's Garden Seeds are unsurpassed. Their present popularity in every county in the United States proves it, for I now have customers at more than 31,000 post-offices. **When once sown, others are not wanted at any price.** Over one-quarter of a million copies of my new Catalogue for 1889 have been mailed already. *It is pronounced the most original, beautifully illustrated and readable Seed Catalogue ever published.* It contains among other things, cash prizes for premium vegetables, etc., to the amount of $3,500. **You should not think of purchasing any Seeds this Spring before sending for it.** It is mailed free to all enclosing stamp for return postage. Address

WM. HENRY MAULE,
1711 Filbert St. **PHILADELPHIA, PA.**

OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds

D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* **in the world.**

D M. FERRY & Co's Illustrated, Descriptive and Priced **SEED ANNUAL** For 1889 Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

Earliest Cauliflower in existence.

D. M. FERRY & CO., Detroit, Mich.

Pearl Strawberry. The handsomest, best flavored, most perfect-formed berry, best colored and MOST PRODUCTIVE. Ahead of JESSIE on the same soil and cultivation. 1¼ ACRES produced $743.87 worth of berries the past season. Send for circ. Plants $10 per 1,000. *Fine Meeche's Quince and Apple trees* in abundance. WEST JERSEY NURSERY CO., Bridgeton, N.J.

SEEDS Our sales in 1888 *double* those of 1887. Why? Because we sell only the *Best*, at Reasonable Prices.
SEED POTATOES, *large stock, great variety.* Small Fruit Plants and Trees. Catalogue Free.
FRANK FORD & SONS, Ravenna, Ohio.

SEEDS.

My Annual PRICED CATALOGUE is now ready and mailed free to all applicants. It contains all the leading and most popular sorts of

Vegetable, Farm,
—AND—
Flower Seeds,

Besides all the desirable novelties of last season, and nearly everything else in my line of business.

ALFRED BRIDGEMAN,
37 East 19th Street, New York City.

SEED AND PLANT CATALOGUE FREE, and if you send the address of 4 persons who buy seeds and plants, we will send a 20-cent package of pansies. Address
ROOP & ZILE, Westminster, Md.

TREES ROOT GRAFTS—*Everything!* No **larger** stock in U. S No **better, no cheaper.** **Pike Co. Nurseries, Louisiana, Mo.**

JESSIE only $2 per 1,000. Crescent, $1; all varieties; prices *free.* SLAYMAKER & SON, Dover, Del.

Stayman's No. 1 Strawberry.

Large and Fine, produced at the rate of **30,000 quarts per acre. Price $2 per dozen; $10 per 100.**
JEWEL the earliest and best black grape known. Equal to the Delaware in quality. **Price, $1.50 each. Send for testimonials.**

STAYMAN & BLACK,
LEAVENWORTH, KANSAS.

Beautiful Strawberries. We are now offering for the first time and only by us, the beautiful **Eureka**, and a strawberry that yielded at the rate of **127 Bushels** to the acre at one picking the past summer—60 other varieties; **80 of Grapes; Thompson's Early Prolific** Red Raspberry, the earliest of all; Palmer Rash, the most productive early Black; **Thompson's Early Mammoth Blackberry**, etc., etc. If you mention this paper we will send you Catalogue free, telling about these beautiful berries & others Everybody wants it

THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, FEBRUARY 2, 1889.

"FARMIN' DON'T PAY."

WITH APOLOGIES TO THE "PARROT."

The farmer who's growlin' "Farmin' don't pay"
Is chewin' or smokin' I'll vow:
And standin' out in his fields to-day
Is his mower, self-binder, or plow.

His wife's a-bringin' in water and wood,
His debts are a-cloudin' his brow,
The "farmer's account" he has kept is no good—
It's a blank, just like his scrub cow.

The world's a-cheatin' him's all he can say
And everything's all in a "skow,"
He's confident only that "Farmin' don't pay"
Some way or another, somehow.

Rexford, Kan. *E. K. M.*

CHANGE OF CLUBBING TERMS.

The Weekly Inter-Ocean and the R. N.-Y., one year, $2.50

The N. Y. Weekly World and the R. N.-Y., $2.25.

The Detroit Free Press and the R. N.-Y., $2.25.

The Courier Journal and the R. N.-Y., $2.50.

The lowest possible clubbing rates with any journal in America will be given on application. Subscribe through the RURAL NEW-YORKER.

A small tuber of the Rural New Yorker Potato No. 2 will be sent to our YEARLY SUBSCRIBERS *who apply, without any charge whatever. It will be sent, as the weather permits, from time to time, so that all shall receive a tuber before the planting season commences.* APPLICATIONS ARE NOW IN ORDER. *No doubt this potato will fail in many parts of the country, but from the reports thus far received, it may be said to be the nearest approach to a perfect potato at present known.*

THE NEXT SPECIAL number of the R. N.-Y. will be the issue two weeks hence. Subject, fertilizers. The first-page cartoon is said by those who have seen proofs, to be one of the most forcible and suggestive illustrations of the kind ever presented.

A friend sends us the following thoughts from "Ben Hur:"

"A man 30 years old should have his fields of life all plowed, and his planting well done, for after that it is summer time, with space scarce enough to ripen his sowing."

"Sympathy is in great degree a result of the mood we are in at the moment; anger forbids the emotion. On the other hand, it is easiest taken on when we are in a state of most absolute self-satisfaction."

"In thankfulness for present mercy, nothing so becomes us as losing sight of past ills."

DON'T talk of the cruelty of dehorning while spaying is tolerated—the meanest, most inexecusable cruelty ever inflicted upon dumb animals.

"I follow farming because it is the highest occupation of man, and we always eat at the first table, and if anything is left then others come in." *M. K.*
Upper Sandusky, Ohio.

THE R. N.-Y. never varies its rates (as published in every issue), for advertising. All advertising patrons are treated precisely alike. This statement is made every year at about this time, in order to spare intending advertisers the trouble of any correspondence with a view to obtaining lower rates. There are but few journals published in this country whose rates are absolutely invariable. The RURAL NEW-YORKER is one of the few.

"While butter of one brand commands $1 per pound on account of its special flavor, pork products from clean, sound animals, as against products of doubtful origin, should find a market at paying rates. Probably there is no article of food at the present time boycotted by so many families as that coming from the pig. And there is no article from the animal so attractive and toothsome to these families as the spareribs and sausage, when not associated with filth or disease."—DR. LEARNED, page 75.

THE present duty on carpet wools is 2½ cents per pound on wool valued at 12 cents and less per pound, and five cents on that worth over 12 cents. The recent wool-growers' convention at Washington urged that the duties should be raised respectively to three and six cents in the new tariff bill, and the Senate has amended its bill, raising the duties on both classes to four and eight cents respectively. To placate the carpet manufacturers, an advance of five per cent. has been made in the duties on manufactured products, but this by no means satisfies the carpet men. They insist that sufficient carpet wool cannot be grown in this country; nay, they maintain that it wouldn't pay American sheep-men to produce this coarse, low-priced kind of wool, and that it ought therefore to be either admitted at a low rate of duty or put on the free list. The chief objection of the farmers really charges dishonesty on the woolen manufacturers. After importing this coarse class of wool, at a low duty nominally for carpet-making, it is claimed that they use a large proportion of it for the manufacture, in whole or part, of various clothing fabrics, thus bringing it into competition with higher grades of American wool. The bill which has just passed the Senate, is not likely to pass the House at this session, and the carpet manufacturers intend to use their utmost efforts to defeat this section of it in the next Congress. The wool-growers, however, are hardly likely to be caught napping.

"'The farmer feeds the world,' it is true; but he is not doing it primarily for applause; that's a sort of 'pay' that doesn't pay very well—pay debts and taxes, for instance. The sleek citizen's 'well done,' furnishes no legal-tender for the hired man."—E. T., page 72.

THE WOMENS' POTATO CONTEST.

ESTIMATED value of souvenirs contributed up to Jan. 18, $900.

THE MAPES FORMULA AND PERUVIAN GUANO CO., New York, $100 in cash for the largest yield grown with the Mapes Potato Manure, stable manure, or both.

W. A. STILES, Editor of Garden and Forest, New York, $5 in cash.

"I find that choice clover hay grown on good land and cut in full bloom or very soon afterwards, will keep work horses in good order with the work I have to do. The hay, however, must be choice. It should be three-quarters clover at least."—T. B. TERRY, page 68.

ENSILAGE.

WHILE the widening experience of farmers has put an end to the claims of such writers as Dr. Bailey, it has not prevented the practical dairymen of the country from recognizing the merits and advantages of ensilage. There was a considerable amount of truth in the claims put forth some 20 years ago, by leading dairy writers, that the "dairy belt" has its limits; although these have proved much wider than those writers thought. Dairying is the child of grazing. It has always begun, and had its strength in well-grassed and well-watered regions. When things "settle themselves," in this continent, it is not doubtful that those parts of it abounding in clear, cold, running streams will be the chief dairy regions. Grass is the basis of butter—*green* grass. Until lately, all-the-year-round butter and cheese dairying has been impossible, as a paying and practical business. It could not be done on the basis of hay and grain and dry fodder. The butter so made not only costs too much, but is too poor. The old perennial exhortation to root-growing was based upon a knowledge of this difficulty; but root-growing in America has never been a success. Both the climate and the habits of the people, are against it. Ensilage solves the problem. It is not going to flood the dairy farmers with wealth; but it is going to make their's a more steady and paying business, and extend its area over the lighter soils, in the well watered sections.

"There is no knowing what good it may do. We women may do so well that we may be asked by our husbands and fathers to do the same year after year. Is this one of the reasons why they are so interested?"—MRS. O. J. PUTNAM, page 69.

THE COST OF DOGS.

HAVE you ever thought seriously of the cost of the dogs in the country? The last census gave Hampden County, Massachusetts, a population of 104,142 in 1880. Last year 4,656 dogs were licensed there. These were, as a rule, prized animals paid for by forehanded people, and it is not unfair to suppose that the number of unlicensed curs and mongrels was nearly as large. The license fees amounted to $10,816, and the damages paid on account of injury done to stock by dogs, reached $2,140.70. The claims for damages show that 327 fowls, 221 sheep, two pigs, two calves and one horse were killed outright; while six fowls, 63 sheep, one calf and three cows were cruelly bitten and maimed. No damages were, of course, collected for the serious injury inflicted on stock by chasing and worrying. Would it be extravagant to estimate the cost of boarding the 4,656 licensed dogs at 50 cents each per week? Hardly. This would make the mere cost of their board $2,328 a week, or $121,056 a year. Add the license fees, and the owners paid $131,872 for their canine pets in that little county last year, to say nothing of the cost of keeping the horde of unlicensed mongrels. What a world of good the aggregate sum would do to the deserving poor of the county! The people of Massachusetts are, as a rule, thrifty, and the number of dogs in the State is not large in comparison with the numbers in most other States. From the above figures concerning the cost of dogs in a single small county in one thrifty State, calculate the aggregate cost of all the dogs in the 2,750 counties in the 38 States of the Union, to say nothing of the eight Territories.

"A favorite theory of mine is that seeds are best when grown in the atitude and location where they thrive best, a theory I shall hold to until it is disproved. I should therefore not hesitate to go south for some seeds, where it is not essential hat they should mature early."—ANON, page 69.

SCOURING WOOL.

THE wool production of Texas is exceeded only by that of Ohio, California and Michigan. Ten years ago Pennsylvania too was ahead of the Lone Star State in this line; but while sheep raising has largely increased in Texas during the last decade, it has considerably decreased in Pennsylvania, which has therefore fallen to the fifth place. Hitherto San Antonio has been the chief wool market of the gigantic Southern State; but Galveston expects soon to get most of the business. One of the largest wool-scouring mills in the country is to be erected there, having a capacity of 20,000 pounds of wool per day working ten hours, with a reserved capacity of doubling the work by running at night in the busy season. The advantages of such an establishment in any place are very great. In the first place, the scouring of the wool saves about 60 per cent. in freight, as the wool when clipped contains about that proportion of grease and trash. This is removed by scouring, insuring a large saving in transportation charges. Moreover, scouring removes all doubt as to possible shrinkage, a calculation that necessarily enters into every wool-purchasing transaction. There are several processes for scouring wool, in nearly all of which the staple is left rather stringy and ropy by being torn by spikes, and forks while it is washed. The Hodgson flushing flume system, which will be in use at Galveston, obviates this objection, besides, it is claimed, yielding from three to five per cent. more wool with a larger per cent. of tops and fewer noils than any other machine. To make the institution complete, it will also include a new process for bagging and packing the wool after it has been scoured. Every device for cheapening transportation charges is sure to benefit the public, either by increasing the price of the product to the producer or decreasing it to the consumer, or both.

"Let Terry go up head. That article of his in last week's R. N.-Yorker is the best of a year." *N. J.*
Cuba, Mo.

DIFFERENT FARM MANURES FOR DIFFERENT CROPS.

WHY should horse manure give better results on some crops, than cow manure when both animals are fed on the same food? Why should poultry, swine, sheep or cow manures vary in their effects upon the same soil? Is it wise economy to mix the different manures or should we apply each kind to some particular soil or crop? What animal is the most economical manure maker? These points have been suggested by friends during the past few months, and we have decided to begin the discussion of the matter in our Manure Special. It is a topic new to most of the farmers with whom we have communicated, and scientific men have, apparently, given little attention to it. Prof. Storer, in a recent letter, says:

"The subject has never been adequately studied, so far as I know. Meanwhile, there can be little doubt as to the wisdom of mixing various kinds of manures when it can be done at small cost. Hogs in the barn-cellars of New England have done a vast amount of good work in this way."

We shall be glad to have the opinions of our readers on these points. The following notes from a very prominent farmer and fruit-grower of Western New York may serve as a text.

"1. Manure is valuable partly in proportion to its fine disintegration and partly in proportion to the richness of the food used by the animals which have made it. Its value also depends much on its fine diffusion through the soil, and some manures are more capable than others of this thorough diffusion. Under all these conditions, poultry manure would stand first, then swine, sheep, horse and cow. I think it more important to ascertain by direct experiment, the nature of the soil, than to try to suit the wants of different plants. Analysis shows much similarity in the composition of the leading crops, although in somewhat different proportions; but I think all would be affected nearly alike by the different manure. But this is not so with soils. The experiments I have made show a great difference. In one region, a certain fertilizer has doubled the wheat crop; in another not ten miles away, it has never produced the slightest apparent result. The manures may be mixed or applied separately, the chief requisite being thorough intermixture."

"I would prosecute a man for damage, if I could, if he plowed my corn after it was coming in silk."—D. C. L., page 72.

BREVITIES.

READ why Mr. Bowditch chose Guernsey cattle—page 81.

WE doubt if the "cure for an egg eater" given on page 72, will prove much of a success.

THE R. N.-Y. will consider it a great favor if its readers will send the dates of any local farmers' meetings to be held during the winter and spring.

THE combs of our Red-cap roosters are immense, closely resembling the illustrations seen of them. As yet they have not frozen, the weather not having been colder than 15 degrees above zero. Red-caps are shapely, beautiful fowls.

WAIT for the RURAL'S SPECIAL on the best of the old and new vegetables; the best of the new and old kinds of crops to raise in the field; the best of the old and new small fruits of all kinds—before making out your orders for next season. These special issues, in which our best practical writers will be heard from should prove very valuable.

FROM a number of our exchanges we learn that retail merchants in Iowa are getting seriously alarmed because, in many sections, farmers are forming co-operative companies for the purpose, not only of buying farming and dairy produce, but also of selling farm implements, groceries, dry goods and other things needed in the family, at cost prices to the members, deducting just enough to pay running expenses. There's no doubt that there is a large profit in such transactions if the right sort of man manages the business, but frequent experience has shown that there is always a great risk of ultimate loss and collapse through mismanagement.

The Swineherd.

PRIZE PORK PRODUCTS.

J. B. LEARNED, M. D.

Objections to swine products due to swine diseases; these are mainly due to improper feeding and filthy surroundings; a confirmatory experiment; pigs stuffed with corn die, while those running in the woods remain healthy; raising pigs on cholera-infected ground; a compost with dead cholera hogs; an unfounded scare; breeds in use; care and feed given; baths; cleanliness; ventilation of pig-styes; ringing objectionable; feeding for growth and fat; hog cholera the punishment for neglect of hygienic conditions; "cholera lard"; our degenerate breeds capable of restoration to their original healthy condition; prime pork products sure of prime prices.

CORNED BEEF had been served with our baked beans for many months before I came to the conclusion that a pig properly cared for would produce just the kind of meat that was most needed here. The nice, crisp, pig pork of my early days had not been forgotten, but filth and disease had of late been so much associated with pork in all forms, that I had sickened of it. Swine journals talked of cholera; the daily papers recited cholera, and every body, but the meat-men, seemed to have touches of it when pork was talked. One-half of my herd of shoats, that had been counted on as safe, died within two or three weeks in the fall of 1884, and I, with the majority of particular folks, had about come to the conclusion that beef must take the place of pork, even with beans, in future. But I had the winter in which to consider this, and finally I decided to try another and more rigid hygienic plan of feeding and general care. I had divided my pigs into two sections—one to be fed for pork and the other for stores. The first received the usual unlimited rations of corn, corn-meal and wheat stuff. It lay by them in some form all the time—soft corn on the ear, etc., being scattered over the ground. The stores ran in the chestnut woods close by, and were fed sparingly. They did not sicken. In a very brief time the "pork" pigs were all buried, and the stores were all in good health and growing. Both were in the open air, and on dry ground. I was forced to the belief that *diet* had something to do in this case, as it had in many others where I had seen families of children prostrated as a whole with some disease, while others equally exposed escaped. It should be said that cholera was near by at a neighboring pen, at this time.

To make the test more emphatic, I determined to put the first sow to farrow on these same grounds, where, during the fall, the dead ones were taken off. It was April; no changes had been made in the way of burying or burning the bedding, etc. Charcoal was sprinkled over the ground, and some lime. Nine new pigs were dropped. The mother had been well treated during the winter, and she furnished the needed nourishment at once. The sow and pigs remained here, under the same roof and upon the same bedding, *plus* more as it was needed from time to time; but no cholera came. The earth was the foundation. There was no flooring. The roof was a lean-to, and a board fence the side. I had selected this particular place and these surroundings for a test ground because writers generally say that the germ remains, and is sure to get an abiding-place in sound animals that are kept on the place, unless fire or deep burial is brought to the rescue. In this immediate vicinity, several hundred pigs have since been bred and matured; but there has been no cholera. During the next spring the heap of compost—earth and dead cholera stock—was opened, handled, aired and finally spread on the surface as a fertilizer. Neither odors nor cholera germs were wanting, and pigs were not wanting to inhale them. My neighbors were more alarmed at this last exposure than they had been at the first. But I was trying this new generation, which I thought in vigorous condition, as an experiment, in an atmosphere of contagion, where the graves had given up their dead. The workman almost trembled for his own safety, and called for full rations of whisky as an antiseptic. He survived; so did the neighbors, and likewise the pigs.

Upon these grounds, not then more than 25 rods removed from the nucleus of the poison, several sows farrowed and reared all their young. The present season 40 sows with their pigs have gone on with safety. The grounds in use at any time have not exceeded 15 acres and have generally been much less. Sometimes a pig gets lame and occasionally one dies, but there has been no evidence of contagion. We are now slaughtering April pigs weighing 275 to 330 pounds. The sows are grade Chester-Whites; the boars, Cheshires and Poland-Chinas full blood. The pens are about one-third of an acre in size. We put 20 in a place and they sleep and feed together Elevated platforms of plank on sleepers hold the feeding troughs. The pigs feed from both sides. Neither mud nor filth abounds on these floors, and very little finds its way into their food. An inch-and-a-half main water pipe connects with the city supply, and gives off, at every dividing fence, a fresh stream which pours into bathing-tubs made of plank. In the warm season, these are every day resorted to, and frequently are full of pigs and water. The pigs get their drink sometimes from the falling stream. With a fair chance, they are vastly more cleanly than they get credit for being. Give them clean beds and a bath-tub and see. A running brook would be preferable, but water pipes serve well. The bath-tub is located over pits filled with cobbles, so that the surface is dry in dry weather. It isn't so this season, however.

The bedding in summer is dry earth or sand; in winter the same, *plus* sawdust, leaves or hay. The opening on the south is never closed; and the pigs never seem to suffer from cold. The roofs are water-tight, but not air-tight, hence there is always fresh air as well as clean bedding. The dung is in the open air, and is covered by rooting and plowing. Clover and rye are thrown over the surface in the spring. In the early part of the season a fair growth is kept up, cut clover is carried daily from the adjoining fields. Small potatoes are purchased in the fall at 15 cents per bushel on the grounds. These are boiled in salt water, after they have been washed, and fed with the grain. Cabbage comes later, and continues some weeks into the winter. It costs $4 per ton, on the ground, loose heads, stumps and all.

The regular rations are two per day, morning and night, consisting of bran, middlings, rye or oats, one or all, during the growing season; with butter-milk, which is brought nearly every day through the year, a distance of 10 miles. The carrying tank holds a little less than 450 gallons; and the milk costs here one cent and four mills per gallon. During the fattening season corn-meal is the leading grain, with the milk; seldom whole corn. No swill is ever brought to the grounds. Steam from the boiler at the meat-room serves to cook the winter rations. The feeding places are the same at all seasons, and are at a considerable distance from the sleeping quarters. Thus some exercise is made necessary summer and winter. Charcoal is made on the grounds or brought here. It is consumed sometimes with eagerness. The trimmings of trees from the grove close by are in winter rather palatable. When the ground is open the pig goes deep in search of what he wants if he has no ring in his nose, and generally finds it; but in winter the supply obtainable in this hay is cut off, and should be furnished. A ring in the pig's nose is no advantage to his health. All grain is too concentrated a food. The growing must be first attended to; then food must be supplied for fat making. I do not consider the pig an exception to the general rule in growing an animal body. Nature's methods must be regarded, else, sooner or later, a bill for damages is sure to be presented. Hog cholera is the form in which it comes here, and the amount of money lost in this country every year on this account is immense. The amount of "cholera lard" too in the market is quite out of proportion with the tastes of fastidious people. I think it is possible to so improve this degenerate sample we now have, in the matter of constitutional vigor, as to restore him to his normal condition. But to use him as a scavenger, as a machine for manure making, and at last as an accumulator of fat from filth, is not the way to do it. Hygiene is needed with the pig as much as with the baby. Both are often sacrificed by its absence.

But this mode of treating the pigs is expensive. The market rates will not make returns; even Strawberry Hill rates, which are almost 100 per cent. in advance of those ruling elsewhere, do not invite extensive investments with an unknown market. I have found my nearest neighbors my first patrons. From this beginning I now receive and fill orders for families in several States to a small extent. My mode of putting up sausage-meat in clean cloth, with a waxed paper covering, is more attractive to many than the use of an intestinal tube of a pig, that reminds one of filth and often of disease. The pure, clean lard from a pig not contaminated with disease, and which is itself clear of adulterants, is also prized by families who want the best. The railroad express trains make it possible to order one's sausage and lard, in cold weather, from a distant market, and while butter of one brand commands $1. per pound on account of its special flavor, pork products from clean, sound animals, as against products of doubtful origin, should find a market at paying rates. Probably there is no article of food at the present time boycotted by so many families as that coming from the pig. And there is no article from the animal so attractive and toothsome to these families as the spareribs and sausage, when not associated with filth or disease.

The improved breeds in form and outline are certainly a great advance upon the razor-back, but their constitution has degenerated. Reformation is demanded here. Breeding helps, but a higher standard of health and more wholesome surroundings are most needed. Pure water, fresh air and suitable foods are as indispensable to the pig as to any other domestic animal.

Hampshire Co., Mass.

Miscellaneous.

CORRESPONDENTS' VIEWS.

AM GLAD the RURAL favors rye. It is the best of chop feed for this part of the country. I find millet excellent feed, but it won't sprout unless the ground is damp. I feed potatoes and shorts mixed to my milch cows, and they do well on the mixture and I don't think the potatoes taint the milk. As shanty foreman, I found that horses that were fed half a pail of potatoes once a week, were better able to stand the work and strong feed than those that got none. R. O.

Kinmount, Canada.

SO FAR I have hesitated to enter my name for the Potato Contest, but I have come to the conclusion that there is no good reason why I should not. I am over 60 years of age, and since I have lived in the country, and taken the R. N.-Y.—five years now—I have always raised all the vegetables for my family, and done all the work, too, except the first plowing. So why should I not enter the P. C.? I knew nothing of gardening until I took the R. N.-Y., but I have learned a great deal since. MRS. C. H. W.

De Soto, Mo.

IN PLOWING A SEVEN-ACRE FIELD of clover sod last fall, I saw but one mouse while the garter snakes were numerous, so it occurred to me that the snakes had destroyed the mice. If so, why should we kill these harmless reptiles? JOHN WARREN.

Ohio.

R. N.-Y. It seems quite evident that some varieties of snakes are not only harmless but beneficial to agriculture.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

THANK you, Mr. T. B. Terry. That honest opinion of an honest man in the RURAL of January 19, just does us good. Very few men seem to understand how it hurts a woman when the money she has helped to earn is doled out to her as to a beggar; very few women are so lacking in sensitive pride that they do not feel it. Perhaps we would be happier if we did not feel this; but most of us would rather wear a shabby gown than beg humbly for the money to buy a new one. A wife who does her duty has as much right to the family money as her husband has. "*No true woman will ever abuse such a partnership, and there are more true women in this world than there are true men.*" So says Mr. Terry, a tribute we may be grateful for while recognizing its perfect truth. And we believe that many husbands, who now act as if afraid to trust their wives with an extra dollar, would act differently if the wives had quietly taken the right stand from the beginning. Have you read a recent story by "Josiah Allen's Wife," entitled "Luman Skinkle's Religion?"

It is a story with the very moral Mr. Terry teaches. It tells of a poor, overworked wife of a farmer, who had slaved all her life, making herself completely the servant of her husband, instead of being his companion and fellow-worker. To quote Josiah Allen's Wife: "Wall, as was nateral to one of his turn, as Luman grew fat and strong and rich, he began to act high-headed and haughty-like, and began to sort o' look down on Phila, act sort o' short and cross to her, and it madded folks dretfully, who knew what she had done fur him. But my reasonin' powers are such that I said to myself that he had some cause to do it, for from the beginnin' of their married life she had jest put herself down at his feet, and if he looked at her at all he *had* to look down. He couldn't see her by lookin' up or sideways, fur she wuzen't there. He had to look down, and then he found her. But he had no need to have looked so fur down; that I gin up."

There, there is a lot of solid sense in that, too. When we assert that a wife has a right to stand on the same level as her husband, we don't mean that she should assume his prerogatives; she has her own exclusive duties, but they should be recognized as being equal in value to the duties of the husband. A woman loses all her charms when she tries to be masculine; but let every one bear in mind that womanliness does not mean weakness. Each to the duties of the sex, whether man or woman; but remember that, after all, the partnership is equal.

NEW YEAR'S PLANS AT HOME.

THE family of Mr. Gleason were all at home to keep the New Year. Supper was over, and the work in the kitchen was done. The boys had done the chores at the barn, and now the hanging lamp was lighted and the father, mother, three boys and two girls were seated in the pleasant sitting-room. In the early morning the circle would be broken, for James was a school-teacher, and Edna was a student in Westmere seminary. Probably they would not meet again till the March winds and sun began to melt away the huge snow drifts that were heaped up, and sugaring would require their labors till the snow was gone.

"Well, children," said Mr. Gleason, as he looked around the group. "The New Year has come, and I trust will be more prosperous than the last has been. It has been a disastrous year to us, in every respect."

"Yes, father," said Elmer, the eldest son. "It did seem as if everything went against us all the year. I got quite discouraged ever so many times. No matter what we tried to do, it was just a dead failure every time."

"It was too bad the way things went. When poor old Doll died, I just cried, I could not help it," said another.

"I always thought that she had too much mea . What ailed her? She was a splendid horse, so gentle and smart," asked Edna.

"Well, it is no use to cry over her now,' said Mr. Gleason.

"I am going to take some agricultural papers this year," said Elmer, "I have subscribed for the RURAL NEW-YORKER, and the Agriculturist, so as to get the experience of wiser heads than ours."

"You had a right to take them, but we have to keep our money, for we shall be compelled to stint this spring, to get seed enough to sow, and we shall also have to buy all the corn and potatoes for planting. I declare I don't see how we shall make the ends meet."

"I know, father, that we shall have to be economical; but I have been reading a good deal this winter. They have lots of books and papers at my boarding place, and they are good farmers, and made good crops last year, and if there is a better way than ours, I want to know it."

"Father does not believe in book farming,' said Edna laughing. "You know the story he tells about Horace Greeley."

"We have followed the old way with a vengeance, and it has been a bad way for us.' Elmer replied.

"I saw a piece in a farmers' paper about onions, when I was over to Mr. Moore's the other day," said Hettie, "and I want a piece of ground for myself, to see if I cannot do something. Ellen Moore had a bed of onions last year, and she sold enough to amount to $30, besides keeping enough for the family to use."

"The maggots will eat yours all up, if you try," said the mother."

"They did not eat hers, and she said she would tell me all how she did, if father would let me have the land."

"There is land enough, but you must do the work and must not be calling the boys to help you," said her father.

"The RURAL has offered prizes for a potato contest. Edna you had better try for one," said Elmer.

"I would like to ever so much, but you boys will have to plow the land for me."

"I am not sure that that is in the bargain. I will see; but you will have to buy your own potatoes to plant, sis."

"I shall speak for the land next to the hog-yard for my onions. Ellen said that would be a splendid place for them, the ground is so rich," said Hettie.

"Why it was never broken up in the world," said her father.

"If you will let me have it for my onion bed, I will try my luck, and Hattie will help me."

"I saw in one of last fall's papers a long article on ensilage, and I would like ever so much to build a silo in the big barn; there is plenty of room for one in the big bay. I have studied out the plan."

"Well, boys, you must remember all these things cost lots of money, and you know how straightened we are."

"Yes, father, but we can build the silo ourselves, and it will take but little lumber. There is enough sawed, and a few pounds of nails. I hope you won't object."

"The last was such a mean corn season, that I kind of calculated I would not put in more than an acre this year," said Mr. Gleason, rather sadly.

"It is no sign that it will be a poor season next year, because the crop was frost-bitten last fall," said Elmer.

"Well, boys, you have all got your plans laid," said Will, and I have one that I want to talk about."

"Well, planning is the order of the evening; let us hear what you are considering, my boy," said Mr. Gleason.

"I would like to take the poultry on shares, and take care of them myself. We have 20 hens and 10 turkeys, and if I return the same number next year—"

"I shall take care of the geese myself," said the mother.

"All right. I do not want them anyway; I know the girls will have to save the feathers for their beds, and I wash my hands of the nuisances," he replied laughing.

"We shall want eggs to use, and chickens to kill—"

"Of course, but how many shall I have in the fall?"

"Who will furnish grain for them?" inquired the mother.

"I will buy half, and I shall want sour milk for the little turkeys; won't that be fair, father?" Will asked.

"I suppose so; but it costs a good deal to raise poultry."

"I intend to sell eggs enough to buy their food."

"Who has been stuffing you, my boy? You will get sick of your bargain by the time summer is half out."

"I would let him try, father," said Elmer, "I am glad he wants to try," and he passed his arm around his brother, and gave him a bright smile of encouragement.

"Now, you have all your plans laid, and I have a plan that I want carried out," said Henry, a stripling of 17, "I want to raise all the calves this year! I think it is a shame to kill them off as farmers do. The old way of raising stock was a good one, and kept the farms up, and then there were young cattle to sell, and they brought the ready cash in a heap."

"We will think about it, but we shall not have much butter to sell, or veal calves to turn off, and then the hogs——"

"Oh, I will teach the calves to drink, and after a little I can make hay tea, and give them skim-milk till they are old enough to eat oats. As to the hogs, let them go to grass in the orchard. They will do first-rate there, for there is water enough to drink, and in September we can boil up pumpkins and give them corn-stalks, and it will do the orchard good to be rooted over by them."

"I declare, boys, you have done a good deal of thinking, I must say. I hope your plans will be carried out," said Mr. Gleason, as he put a fresh supply of wood in the stove. 'Farming has not paid me for some years back; we do not get such crops as farmers used to get off the same ground. Folks complain that the soil is run out. I do not know but that is the case; but I cannot make it pay. I have run behindhand for the last ten years, and how I shall pay the interest on the mortgage next spring is more than I can tell. It plagues me more than you can think."

"Oh, I shall have money enough to pay that when my school is out, father," said Elmer, cheerfully."

"You are a good boy, but what will you do my lad?"

"Go to work and earn some more. The dear old farm shall be kept at any rate. The boys and I have talked it over, and we are going to make farming pay."

"Go ahead; carry out your plans; but don't try too much book farming."

S. H. ROWELL.

GOLDEN GRAINS.

IN the bulletin of the Iowa Board of Health they say that they verily believe not one in twenty-five who commit suicide knows anything about the comforts and sustaining power of religion. It may not satisfy all the demands of philosophy and science. It does give contentment, cheerfulness, and length and happiness of days to its fortunate possessor.

THACKERAY, in Pendennis, says the doctor stands over the patient in the fever, the wife expectant, the children unconscious, as if he were fate, the dispenser of life and death; he must let the patient off this time, the woman prays so for his respite! One can fancy how awful the responsibility must be to a conscientious man; how cruel the feeling that he has given the wrong remedy or that it might have been possible to do better; how harassing the sympathy with survivors, if the case is unfortunate——how immense the delights of victory.....

DEAN STANLEY was a firm believer in the gospel of "occupation" He said that leisure misused, an idle hour waiting to be employed, idle hands with no occupation, idle and empty minds with nothing to think—these are the main temptations to evil. Fill up that empty void, employ these vacant hours, occupy these listless hands, and the evil will depart, because it has no place to enter in, because it is conquered by good.....

THE best antidote against evil of all kinds, against the evil thoughts that haunt the soul, against the needless perplexities which distract the conscience, is to keep hold of the good we have. Impure thoughts will not stand against pure words and prayers and deeds. Little doubts will not avail against great certainties. Fix your attention on things above, and then you will be less and less troubled by the cares, the temptations, the troubles of things on earth.....

THE LORD'S Supper is the one great pattern meal. It teaches us that the family table ought to be bright and cheerful, a sort of domestic altar, where every one casts down his offering, great or small, of pleasantness and peace; where, for at least a brief space in the day, all annoyances are laid aside, all stormy tempers hushed, all quarrels healed, every one being glad and contented to sit down at the same board and eat the same bread and salt, making it, whether it be a rich repast, or a dinner of herbs, equally a joyful meal.....

THE MARCH OF PROGRESS in butter making has been wonderfully accelerated by the discovery, and placing within the reach of the Dairymen in all markets Thatcher's Orange Butter Color.—*Adv.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

FOOD ACCOMPANIMENTS;—AFTERNOON "TEAS";—THOREAU'S BOOKS.

MARY WAGER-FISHER.

THE success of the table largely lies in two things, the congruity of the company and the congruity of the food. The selection of the company is a personal matter; but in the serving of food a few suggestions may not be amiss.

For breakfast, omelet, eggs fried or scrambled go with broiled or fried ham; sausage with buckwheat cakes; eggs with mushrooms, or buttered toast; fried smelts with cress or slices of lemon; broiled chops with potatoes; currant, or rhubarb jelly, with venison steak; codfish balls with tomato catsup and brown bread; omelet with picked cod and potato balls; broiled salt fish with stewed potatoes; codfish balls with poached eggs; omelet with broiled sheep's kidney; lamb chops with tomato sauce; breaded chops with tomatoes; sliced cucumber with egg-plant; egg-plant with broiled tomatoes; omelet or bacon with liver broiled or fried; meat croquettes with stewed potatoes, and hash on toast with soft-boiled eggs. Fruit is as acceptable for breakfast as soup for dinner, and is preferred by most people at the outset of the meal. Then follow, as a separate course, what comes under the head of mush—oatmeal, hominy, grits, rice, graham, etc. The best and cheapest way to get wheat for a breakfast dish, is to have your miller crack it for you. On the Pacific coast cracked wheat can be had in sacks, the same as corn meal; but on the Atlantic sea-board good wheaten "grits" are differently prepared and are more expensive than oat-meal. But an obliging miller will crack the wheat for you, and you will find the grits very nice; boil in salted water.

A very nice dish of cooked fruit is coddled apples, which are relished by persons who do not care for the ordinary stewed apple-sauce. Pare and core the apples without cutting them, at least, not more than once. Pack them closely together in the bottom of a stew-pan, in one layer only. Sprinkle over them a cupful of sugar, add a little hot water, cover them tightly and steam until they are tender, lift them out carefully, pour over them the juice, and when cold they are ready to serve: delicious; also nice for dessert. For dinner, jellies go with game, mutton and fowl. In Baltimore with roast duck, fried mush, or hominy balls are served; with boiled chicken, egg sauce; with roast turkey, oyster stuffing, or escalloped oysters, cranberry jelly, boiled rice, celery, mashed potatoes, lettuce salad, stewed turnips; with mutton, boiled rice (as a vegetable), sweet potatoes, corn, lettuce salad. Stewed tomatoes go with baked mutton, baked pototoes, peas, cabbage salad; with roast goose go apple-sauce and potato croquettes; with roast beef, macaroni baked with grated cheese, or Yorkshire pudding; with beef steaks, stewed tomatoes and hot-slaw. Stewed cabbage with apple sauce, also goes with baked ham. Mashed potatoes and stewed or baked tomatoes go with broiled chops; stewed tomatoes sweet potatoes and celery with roasted rabbit. Egg sauce accompanies most boiled fish; parsley sauce, broiled; rice croquettes are nice with roasted fowl. Toast goes with broiled oysters; cold-slaw with escalloped or stewed oysters (for lunch); parsley sauce with boiled sheep's head. Cheese is a part of the dessert and is served first. Asparagus is served as a course by itself. Boiled macaroni served with grated cheese sometimes takes the place of soup at dinner. The Chinese serve their dessert first. The French serve all green salads just prior to the dessert—a fashion generally adopted elsewhere.

THE AFTERNOON "TEA."

For bringing people together at a trifling expense and trouble, the afternoon "tea" which in the East has grown into such vogue as to threaten to become a nuisance, has much in its favor. It is informal and unpretentious, and can be "managed" by people in very moderate circumstances. The essentials are one or two or more connecting rooms, pleasantly warm, but well ventilated, seats, a few cakes, thin slices of bread and butter, a small table with a pot of hot tea (coffee and cocoa may be included) the necessary cups, etc., for serving it, and a young girl to serve it. Familar guests in the way of young gentlemen, may be levied upon to help pass the refreshments which must be of a very light and simple character. From four to six P. M. are the usual hours for a "tea," and people who are asked to come, drop in informally in bonnet and cloak, although the latter as well as men's top-coats are left in the hall or dressing room. One can remain from ten minutes to two hours. It is a very good way to introduce a visiting friend to one's neighbors by asking the latter, by note, or in person, to come at a given time to meet your friend So-and-So, giving some bit of information about the friend to add to the interest. A few such "teas" in a country neighborhood during the winter season, will brighten it up wonderfully by developing the social qualities of neighbors and bringing them together. People will respond to and respect a definite invitation, who will allow the demands of every-day life to prevent them from paying visits of a general character. People who are really worth knowing care far more for talk with other people, than for something to eat, of which they are supposed to have plenty at home. Sometimes two ladies in a neighborhood pool their resources and give a "tea" jointly, first at the house of one; then, later on in the season, at the other's.

The books selected by Lawson Valentine for the "Women's National Potato Contest" happily include a number of volumes by Thoreau, than whom no writer ever told more of what there is to be seen in the country. He seems to have been all eyes, seeing every thing, and thinking nothing commonplace, as indeed nothing in Nature ever is It seems impossible that any young man or boy who reads Thoreau, can fail to find every bit of country or corner of the farm, a mine of interest, and his books ought to set young farmers all over the country to making daily notes of what they see—and women, too. John Burrough's books are capitally good also. The "laddie" finds endless entertainment in his "Signs and Seasons."

FRIGHTENING CHILDREN.

THE world in many respects is wiser to day than it was a quarter of a century ago, and happily improvements have been made in the treatment of children as well as in other things of less importance. The severity which our grand-parents practised towards their offspring, and their ignorance of the structure of the human body and of the intricate processes of the mind, make us wonder that serious consequences did not more often follow their well-meant but misguided efforts. I remember a thing which happened during my childish school days, which I think of now with a nervous horror that such a thing should have been allowed to happen a second time in an enlightened community. In a school of about 30 pupils there was a little fellow not over five or six years of age, a harmless, inoffensive child, whom the teacher, a man, seemed to have a mania for tormenting. Every few days he would call the little boy from his seat and tell him he was such a bad boy that he was going to put him in the stove. He would then open the stove door and rake the red-hot coals to the front, and seizing his helpless victim, would swing his head uncomfortably near the fire, as if he truly meant to carry his threat into execution. The boy would sob and cry pitifully, and beg the teacher not to do it, promising to be a better boy, although what fault he had committed, it would have been hard for the tyrant himself to have explained.

After a season of this, he would pretend to relent and let the boy go to his seat, as if he were doing something magnanimous. This cruelty was practiced every few days through the winter school term. Such an experience would have thrown a very nervous child into convulsions. I was a year or two older than the boy at that time, and although I felt that the teacher would not dare to do as he threatened, and roast the boy, yet my flesh would creep with fear and excitement. Whether this shameless course of conduct would have permanently injured the child, I do not know, as the little fellow died a few months afterwards of scarlet-fever. I smile now when I think how soon in these days, if such an occurrence called for it, a scalping committee of mothers would be organized to avenge the injury. Whether this story was repeated at the time in the homes of the pupils, I do not remember; but if it was, it certainly seems like criminal ignorance or carelessness, to have let it pass without calling the teacher to account. Who knows but among the increasing numbers of the insane, the causes leading to the deplorable conditions of some of them may not be traced back to some such shameful disregard of the laws of nature.

AUNT RACHEL.

WASHING.

THERE is no subject pertaining to housework upon which may be found so much independence and diversity of opinion as upon the process of making dirty clothes clean. This difference in opinions is the result of the introduction of many machines, soaps, powders and fluids, all claiming such wonderful advantages, even to the power of making dirt disappear without rubbing. While one woman finds a machine that proves labor-saving to her; to another it is the reverse, its manipulation being as laborious as the use of a pounder or a wash-board. Thus success or failure of a washing-machine must remain in doubt. One woman uses washing-fluids with the best of results; another will have nothing to do with them; but uses soap while perfectly ignorant as to its composition. One uses lukewarm water throughout; another goes to the other extreme, and puts dry clothes into boiling water. One will pound or put dry clothes to soak in almost boiling water, but will object to actually boiling them before removing the dirt; while another is willing to let water, soap and heat have the first chance. One believes that soaking clothes over-night draws out stains and loosens dirt; another affirms that the dirt comes out all the harder for the soaking.

In addition to these are those who have faith in soaking clothes over-night, or for a time in the morning, in cold or warm water or cold or warm suds. Among those willing to boil clothes first, some believe in soaking them before putting them in the boiler, before or after the water, soap, etc. have come to a boil; others, through a natural sensitiveness in handling soiled garments till they have been purified by boiling, put them directly in the boiler; and so opinions vary and processes multiply without end.

The old way to which many cling, is to pound everything through lukewarm suds, rub thor-

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

oughly through another suds, put to boil in cold suds and rinse in—I don't know how many waters. The woman who follows this process, and lives to bring the clothes in from the line, may be assured of beautifully white clothes. "What's to hinder?" as the man said to his friend, who exclaimed upon seeing Niagara Falls for the first time, "By gar! how she do come down!"

As to the different ways of washing, I have been pretty well around "Robin Hood's barn," and from my experimenting I have extracted these conclusions: The machine, soap, fluid, powder or process is yet to be invented applicable to family washings, that will extract dirt from bleached muslin bands, worn and sweated in dirt, without rubbing by hand or on a wash-board. With good suds, a powder will accomplish as much as most machines. Clothes will wash as easily after thirty minutes' soaking in warm suds as after pounding. Clothes put in strong, cold suds, with or without borax or fluid, and brought slowly to or near the boiling point will part company with more stains and dirt than is possible by pounding or soaking. Soaking clothes in good suds over-night or for a time in the morning, is a great help. White soap is better than dark soap. Borax is the best agent in connection with any soap for winter washings containing choice flannels. Flannels washed in lukewarm suds, rinsed in lukewarm water, left in hot water till cold and dried without freezing, will be wholesome and not shrink. A good fluid does not injure clothes more than hard rubbing, and will take hold of stains and all kinds of dirt better than soap. Any indication of bluing shows poor taste and may be injurious to adults the same as to infants. Clothes should be thoroughly rinsed, the last water being as nearly hot as possible, if cold, stiff fingers are to be avoided while hanging them out. The washing should never be "the event of the day" to the neglect of every other duty, especially personal appearance. A process allowing sufficient time for the usual morning's work is worthy of the consideration of every progressive housekeeper. There is a satisfaction in converting the valuable yet worthless contents of a clothes-basket into clean, sweet usefulness, and all will agree that the easiest way to do it, is sufficiently hard to satisfy every one.

The two following ways of washing I have found to be satisfactory in every respect, and as variations are admissible, they may prove the same to others. The fluid is composed of one can (pound) of Babbitt's potash, one ounce, each, of the muriate of ammonia, and salts of tartar, and one gallon of water. A gallon jug is the best thing in which to make and keep it. But little of the water is added at first; cover, and when dissolved add the remainder and cork. It can be made in a crock and kept in bottles or glass cans.

Put the clothes to soak over-night in warm water (cold will do in summer) containing one half the soap, dissolved, and two tablespoonfuls of powdered borax or one-half teacupful of fluid. In the morning wring the clothes out, put them in a second tub and pour over them the remaining soap, dissolved in sufficient water to cover. Fill the boiler and while the water is heating, do up the morning's work and make all possible preparations for dinner; then wring the clothes out and put them in the boiler to scald, either before or after looking over the wearing apparel, wash flannels, calicoes, etc., empty the tub; remove the clothes from the boiler to the tub, add water to cool, where needed rub articles not already rubbed, having rinsed the flannels in this water at the beginning and emptied the boiler and refilled it, to warm the next rinsing water and to scald the flannels. Empty this second tub, prepare the last water in the other, slightly blued, and instead of putting the clothes all in together before wringing them out, turn them in the adjoining tub and take one article at a time.

When not convenient to soak clothes overnight, put them in the boiler with cold water, the whole amount of soap, dissolved, and two table-spoonfuls of borax or one-half tea-cupful of fluid. Put unbleached pieces, if any, a-soak in a little cold water or suds from the boiler. While the clothes are coming to a boil, and the longer it takes the better, attend to the usual house-work; then remove to a tub, put the hot suds in the tub containing the other pieces, refill the boiler, throw a little water over the boiled clothes from time to time, to get them through the wringer with comfort, and in the water left, wash flannels, calicoes, etc., and empty the tub; add the first clothes and enough water in which to rinse and look them over, having rinsed the flannels first, and calicoes afterwards in the hot suds. Now put everything through one or two waters according to the size of the washing. When a washing is large and but few if any garments can go in the first boiler, put the others to soak in warm suds, and then in the boiler while rubbing the flannels, etc., after which proceed as above. The borax or fluid may be omitted from both processes.

MEDORA CORBETT.

A FARMER'S DAUGHTER'S DOMESTIC REVERIES.

CHARITY SWEETHEART.

"YOU girls do nothing but sit all afternoon and gossip." So said Burt, when Delia Crane and Alice Barber came to spend the day with me. We each had a sock for a brother to knit, and worked at it faithfully, while our conversation was chiefly of the missionary society, and how to raise money for a library, and the approaching church festival, as I remembered afterwards. But I thought how unjust it was to make such an assertion, and especially when I know that if there *is* a bit of real gossip going in the village, you may trust Burt for having it first, and telling it over to the first crowd of boys that happen to get their heads together. "I heard in the store"—or "in the blacksmith's shop"—and sometimes "at the church," are expressions that show me there is gossip among the men who profess to think it is something that is common only among women. And yet, as far as I see, girls do not trouble themselves about their neighbors' affairs, but are rather given to thinking of themselves. Poor Burt means well; but is like a good many careless people—always ready to put the blame on some one else when brought up for neglect of duty—so few people are willing to shoulder the blame when they have done anything wrong! On the contrary, they are sure to fly into a passion if any one hints that they are not right. "Endureth all things" seems to be no part of daily living nowadays.

I have, this year, a lot of hyacinths, that gave me great pleasure, watching the opening buds. One bulb has greatly interested me, for I had by mistake planted it nearly upside down; but the shoot came up, and grew toward the light, and bent out forward to the window, so that when its white flowers opened it was almost straight. I told Delia Crane about it the day we talked "gossip" and how it had seemed to me a hopeful sign for any crooked nature, and she was very much amused and said, "Why, Charity, you've made quite a little sermon out of it." And so whether it is Burt or I who is the crooked hyacinth here, I don't doubt but some day we shall be straight enough, even if our growing has been upside down.

CHARITY NOT BLAMELESS.

NOW I have often wondered, and my wonder has always increased after reading anything from the pen of Charity Sweetheart, how she (if there is really such a person,) dares to write such fault-finding letters concerning her father and brother. I, for one, would not care to see the expression on their faces, if they should chance upon certain passages in the household, that do not give much of a shine to their characters. Do you suppose their love for her would be increased or diminished? In my opinion it would fall considerably below the zero mark. And if she, a daughter and sister, can *write* such things, I do not believe her home conversation and ways are such as would be likely to inspire consideration should she see a chance for mending matters. I believe "Burt" to be a good boy, although he may be heedless; but with the right management such boys grow into good-hearted, thoughtful men. As for her father, who has probably been a hard-working farmer, and who must now be quite advanced in life and somewhat thoughtless, she ought to be especially kind; for what may seem a small thing to her may not seem so to him, and what may seem a few steps to her, will look a long way off to him. The eyes of age and youth look at things differently.

SIS.

CHEAP LIVING.

THE strangest thing about people who are obliged to live on small incomes is the obstinacy with which they cling to steaks, chops and roasts as the summum bonum of good living. This obstinacy is equaled only by the firmness with which they resent and resist any innovation which takes the form of attempting to teach them new dishes.

Miss Corson says that her most successful efforts among the lower and middle classes have been in teaching children and young girls, but that she finds women over 30, as a general thing, very unteachable and set in their ways.

A calf's head is one of the economical dishes of the Grey family. We call it a luxurious economy, so closely does it resemble terrapin. Be careful to get a fresh, white one with the skin on. In most places it costs 25 cents. Have the butcher saw it in two. Remove the brains and wash it in several waters. Cover it with three quarts of cold water, season with pepper, salt, and mace, and simmer gently until the flesh is tender. The tongue when tender can be removed, and makes a nice supper dish, sliced cold and served on a bed of parsley with slices of lemon. The flesh of the head should be removed, and the bones returned to the soup-kettle to simmer another hour. Then strain, and set aside the broth, half of which will make an excellent mock-turtle soup, while the other half will be needed in preparing various dishes from the flesh.

A LÂ POULETTE

is one of the nicest of these. Cut a quantity of the flesh into dice, and make a sauce by melting two ounces of butter in a stew-pan, and stirring in smoothly a table-spoonful of flour; add a pint of hot milk and when quite smooth, the beaten yelks of two eggs. Set the saucepan inside of another containing water, while you add the meat to heat through. If it boils it will curdle. Season with salt, pepper and mace, or grated nutmeg. At the last add a trifle of Cayenne and a tea-spoonful of lemon juice, and sprinkle chopped parsley over the top.

SCALLOPED.

Make the above sauce, omitting the eggs, and using the liquor in which the head was boiled instead of milk. Put a layer of meat in a buttered pudding-dish, moisten with this sauce, and so continue until the dish is three-quarters full. Dot with bits of butter, and sprinkle with bread crumbs on the top, and bake half an hour. It may be varied by mashing the brains (after having thoroughly washed them and removed all the membranes) to a smooth paste with pepper, salt and a beaten egg, and spreading this paste over the top of the scallop. The brains are also delicious if breaded and fried, and served with tomato sauce.

CALF'S HEAD, TERRAPIN STYLE.

Cut a pound of cold, boiled calf's head, and half a pound of calf's liver that has been boiled until tender, into small squares. Make a sauce of a cupful of the liquor in which it was boiled, seasoning it with herbs and fried, minced onions, and thickening with browned flour. Heat the meat in this, and when ready to dish it mingle with a half pint of the sauce made as directed in calf's head *à la poulette*. Season rather highly, using a little mushroom or walnut catsup if you have it. Work the yelks of two hard-boiled eggs to a paste with a little melted butter, make into small balls, and roll in flour. Make also a dozen force-meat balls of the ears chopped fine, mixed with a few very fine crumbs, half a beaten egg, and a tea-spoonful of melted butter, and seasoned to taste; roll into balls of the same size, and drop for two minutes, with egg balls, into a little of the boiling liquor. Lift out the meat with a skimmer; lay the egg and force-meat balls around it, and pour the gravy over it.

MINNIE GRAY.

Miscellaneous Advertising.

When You Know

That scores of people have been cured of Boils, Carbuncles, and Scrofulous Sores by the use of

Ayer's Sarsaparilla

why not try it yourself? As a blood-purifier, this medicine has no equal. Listen to good advice: Take Ayer's Sarsaparilla, and no other.

"I had numbers of carbuncles on my neck and back, with swellings in my armpits, and was tormented with pain almost beyond endurance. All means of relief to which I resorted failed until I began to use Ayer's Sarsaparilla. One bottle of this remedy restored me to health."—S. Carter, Nashville, Tennessee.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.

Price $1; six, $5. Worth $5 a bottle.

News of the Week.

HOME NEWS.

SATURDAY, January 26, 1889.

The Navajo Indians of Arizona own 245,000 horses and ponies, 300 mules, 3,500 cattle, 800,000 goats and 500 burros. The wool clipped for the year amounted to 1,200,000 pounds. They also sold 300,000 sheep pelts and 100,000 goat skins. The Indian farmers raised 8,000 bushels of wheat, 75,000 bushels of corn, 20,000 pumpkins and 15,000 melons.... Twenty years ago there were 92 lightning-rod factories in the United States. To-day there are but three, and those doing a trifling business.... The United States consume 160,000,000 pairs of boots and shoes per annum, 100,000,000 of which are furnished by the New England States. .... It turns out that several organizations of so-called White-Caps have been bogus, being started by witless witlings for the purposes of practical joking. During the past week there are accounts of three whippings by real White-Caps and a large number of "warnings." In three cases, the victims have started suits for damages against those who have maltreated them, and in two cases attacking White-Caps were fired upon and several were wounded and one killed. Where they met with resistance, they always fled. Later reports go to prove that a large proportion of the more reputable members are farmers..... Detroit wants a cattle inspector. Chicago and St. Louis have one.....In South Omaha 10,000 men are employed in the packing-houses.....The only Spanish moss manufactory in the United States is at Fort Worth, Texas.....The shortage in the stock of domestic wool in the United States is 48,000,000 pounds..... According to the figures furnished by the chancellors of the several dioceses, the total number of active Catholics now in the United States is 8,157,656. The number of priests is 8,818, of churches 1,353, and of chapels 1,480. There are 199 orphan asylums, 32 theological seminaries, 725 colleges, 549 academies, and 2,799 parochial schools, with 697,196 scholars. There are 13 archbishops and 73 bishops. It is customary, in making allowance for infants, minors and non-church goers, to compute the entire population of any religious body in this country as 50 per cent. greater than its number of active members. On this basis the total number of Catholics in the United States, active and nominal, would be, for 1888, 12,000,000, against 9,500,000 in 1884.....Justice Miller of the United States Supreme Court has just had an operation for lithotomy successfully performed on him. It is the second within ten years, the first having occurred in 1878..... There is a midwinter flood in Montreal. The wharves are submerged, and it is feared that the temporary dike completed last year will give way..... Owing to mild weather a part of the ice palace in process of erection at Montreal collapsed Thursday afternoon, the thermometer registering 55 in the shade. It looks as if the St. Paul ice palace would have to be built of artificial ice, if built at all.....The twenty-first annual meeting of the Woman's Board of Missions was held Wednesday at Worcester Mass. During the past year $93,941.41 were received in legacies and donations..... Those who have the George Washington centenary in hand in New York have asked the State legislature for $175,000 to defray expenses of one sort or another....."There is not a particle of rain, snow or even mist in the United States to-day," said the United States Signal Officer in New York last Sunday morning.....There are in South Carolina 15,000 whites who cannot read or write, an equal number in Tennessee, 20,000 in Georgia, 20,000 in Alabama, 15,000 in Mississippi, 20,000 in Louisiana, 20,000 in North Carolina, and 25,000 in Virginia.....High License has cut down the number of saloons in St. Paul from 763 to 361—a falling off of one half in one year .....The railroads east of the Mississippi River have made inauguration-day rates of one full fare for the round trip, tickets limited from Feburary 28 to March 8.....The Ohio legislature has passed a bill to suppress "bucket shops," and gambling in stocks, bonds, petroleum, cotton, grain, provisions and other produce—implying that a buyer or seller must receive or deliver goods which the contract calls for..... During the past 13 years 423 railway companies with 43,770 miles of lines—more than one-third of the entire mileage of the country to-day—and representing in securities almost $2,545,000,000, over 30 per cent. of the present railway capital—have been seized by the courts for the benefit of their creditors and sold at auction. The directors of nearly all of them, or the director-in-chief at any rate, have made big money out of their roads while the stockholders suffered. The roads are, for the most part, used for stock-gambling purposes, the officials in control making money by arbitrarily raising or depressing the stock, with no regard for the interests of the share-holders. Then some of them were purposely wrecked to "freeze out" the original stock-holders..... The Ford Immigration Committee favor a bill providing that all intending emigrants be compelled to give three months' notice of their intention to come to this country, and to submit to an examination by a United States consular agent or other proper officer as to their character, antecedents and general fitness, upon the result of which will depend their admission to the United States. It is also recommended that provision be made for the return to their native country of emigrants, who after two years' residence in the United States shall prove to be objectionable and the Government assumes control of Castle Garden.....No Governor, so far as we have seen, has neglected in his message to refer to the tidal wave of bribery which struck this country in November..... Nothing new with regard to the "Electric Sugar Swindle"..... The Dominion Government has decided to largely reduce, if not entirely withdraw, the amount annually expended to assist immigration into Canada. Last year $244,789 were expended on this account, and now the Knights of Labor have demanded that no more assisted passages be granted. They are urging Sir John Macdonald to introduce a measure to exclude alien labor, and he has promised to move in the matter. He states, however, that any measure he may introduce cannot exclude working-men coming into the country from any other portion of the British possessions.....The Dominion Government is now considering the question of increasing the duty on American flour from 50 cents to $1 per barrel as an offset to the proposal to impose a duty on fresh fish entering the United States from Canada..... The annual resources of Alaska are estimated by Governor Swineford in his last report at $9,000,000.....Miss Mary Garrett of Baltimore, is building, for Bryn Mawr College, a girls' preparatory school, to cost $200,000. Her father, the late Robert Garrett, of the B. and O. R.R., left her about $20,000,000..... Mrs. Jay Gould died January 14th, aged 50 years.....A vein of silver extending for miles, and showing an assay of $2,800 to the ton, has been struck within twelve miles of Duluth.....W. D. Washburn has been chosen United States Senator for Minnesota, and Anthony Higgins for Delaware; both Republicans. Matt. W. Ransom, Democrat, has been chosen for North Carolina. The farmers were opposed to the three beaten candidates..... Wednesday, Senator Hale reported from the Census Committee, with several important amendments, the House bill to provide for the taking of the 11th census of the United States. Provision is made for an enumeration of the surviving veterans of the war of the rebellion, the organizations to which they belong, and their length of service during the war. The population schedule is to include an inquiry relating to the number of negroes, mulattoes, quadroons, and octoroons. Statistics are to be taken relating to the recorded indebtedness of private corporations and individuals, and also to animals not on farms..... The House has passed the omnibus bill providing for the admission of North and South Dakota, Montana, Washington and New Mexico, and the Senate is likely to pass it also.... In the Wisconsin Senate the other day, a bill was introduced providing for the appointment of a railway commission to decide on the reasonableness of rates charged by railway companies in the State.....George Hacker, an Indianapolis anarchist, who stabbed his employer, James Bruce, because the latter expressed gratification at the election of General Harrison, was sentenced Thursday to fourteen years in the penitentiary.....In the Roman Catholic Cathedral at Philadelphia, Thursday morning, Miss Louisa Bouvier Drexel, daughter of the late Francis A. Drexel, was married to Edward De Vaux Morrell, Archbishop Ryan officiating. The gifts to the bride are valued at $250,000.....In the Illinois Senate the other day Mr. Fuller introduced bills for reducing railway fares to two cents a mile; making it unlawful, with a fine of from $1,000 to $5,000, for elective or appointive officials to accept or use railway passes.....The boomers are pouring into Oklahoma by the hundreds. Within the past week 750 wagons have crossed the Canadian River on the way to the coveted lands. The authorities appear to be doing nothing to check the invasion or expel the invaders.....

The Sunny Side.

Enough has been written on the subject of consumption, to make even a well man morbid and apprehensive.

But this has all been in its discouraging aspect.

Now, we are led, or more exactly speaking, Compound Oxpgen urges us to say cheerful things.

However, better than all we can possibly say, are the words of our patients, or we might say, our *ex*-patients, for they are relieved or cured now.

Observe the comfort and encouragement in the following brief extracts.

PORTAGE, Wis., Jan. 30, 1888.

"My wife has been taking your Compound Oxyen for over two years for consumption and has derived much benefit from its use. In fact I think she would have died long ago but for it." H. D. JAMES.

LITTLE ROCK, ARK., March 30, 1888.

"I am happy to inform you that I am of the opinion that your Compound Oxygen saved my life." MR. J. T. BAILEY.

NASHUA. N. H., Feb. 14, 1888.

"I commenced your Compound Oxygen Treatment the last of August, 1887, and was happily surprised to find at the end of one month I was almost entirely relieved."

MRS. S. K. DAGGETY.

AHENS, OHIO, Feb. 29, 1888.

"The effects of the Compound Oxygen Treatment in my case were wonderful. I feel very confident that I owe my life to the Compound Oxygen," MRS. M. E. WARDEN.

For further information regarding Compound Oxygen, send for our brochure of 200 pages, containing the full history of the treatment and a record of cures in some very interesting cases. The brochure will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa.; or 331 Montgomery street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, January 26, 1889.

In spite of the disturbed condition of French politics, preparations for the great International Exhibition that is to be opened in Paris in May next still go on. Although the display will be by no means as attractive as was that of 1867, there is every prospect that the industrial growth of the world will be amply set forth in a splendid object-lesson. There is no country to which America was more indebted during its struggle for independence than to France, and we can now, in some measure, help to repay the obligation by taking an active part in the Exposition of 1889. Germany refuses to make any official notice of it, and several other European countries will give little or no State aid to exhibitors from their own borders. Indeed this country appears willing to do more than any other .....Alessandro Gavazzi, an Italian ex-priest, who for 40 years has been denouncing the papal authority all over Europe and this country, died the other day aged 80..... Nearly a million Lebel rifles have been turned out in France, yet the manufacture of them continues, since the Government intends to have four rifles ready for each soldier when the great mobilization comes..... The Samoan, or Navigators' Islands consist of a group of nine inhabited islands about 800 miles south of the equator, and 400 miles northeast of the Feejee Islands. They have a population of 40,000 and an area of 1,120 square miles. There has been an understanding or treaty between this country, Great Britain and Germany, to the effect that the islands should remain indepedent, and the United States have obtained control of the best harbor in the islands as a naval depot. In its new lust for colonization Germany has of late been carrying things with a high hand there, deposing one king, who is still held a prisoner, setting up another, fomenting civil war, bombarding villages, arresting natives and foreign settlers, among the latter an American. It is also said that they have torn down the American flag and burned it. Much excitement in Washington. A vote just passed appropriating $600,000 to maintain American rights and treaty obligations on the islands. One United States war vessel is there now, and two others have been sent there....

Public Speakers and Singers

Can use "BROWN'S BRONCHIAL TROCHES" freely, without fear of injury, as they contain nothing injurious. They are invaluable for allaying the hoarseness and irritation incident to vocal exertion, effectually clearing and strengthening the voice. "They greatly relieve any uneasiness in the throat." —S. S. Curry, Teacher of Oratory, Boston. Ask for and obtain only "BROWN'S BRONCHIAL TROCHES." 25 cents per box.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, January 26, 1889.

The following officers of the Association of American Agricultural Colleges and Experiment Stations were elected the other day at their Convention at Knoxville, Tenn. President, C. W. Atherton of Pennsylvania; Secretary, C. E. Thorn of Ohio; Vice presidents, S. W. Johnson of Connecticut, C. L. Ingersoll of Colorado, L. L. Maginnis of Texas, E. A. Murphree of Arkansas and W. B. Preston of Virginia; Executive Committee, Alvord of Maryland, Henry of Wisconsin, Roberts of New York, McBride of South Carolina and Goodell of Massachusetts.... ...The planters of Union and Kershaw counties, S. C., are somewhat alarmed at the prospect of a negro exodus, a number of car-loads of negroes having just left both counties for Arkansas, their passages being prepaid by railroad contractors, who have engaged them for two years under an iron-clad contract. It is expected that others will soon follow, leaving the fields without enough hands to till them..... In the last 10 years New Zealand has exported 70,000,000 rabbit skins valued at $1,375,000. In the same time the colony of Victoria, in Australia, has exported 29,000,000. There's a large market for them in London..... Inoculating hogs with the germs of the hog cholera, with a view to keeping them from taking the disease in virulent form, was a failure in Kansas. Out of 307 well hogs, 290 took the disease through the inoculation, and died..... .....Boston received 124,468 cattle, 557,613 sheep and 1,145,446 swine in 1888 ..... Kansas City received in 1888 a total of 1,056,086 cattle, 2,008,984 hogs and 351,050 sheep, an increase over 1887 of 386,862 cattle, and 141,094 sheep, and a decrease of 414 278 hogs. ..... Omaha received 1,283,600 hogs, 340,469 cattle and 158,503 sheep during 1888, against 1,011,706 hogs, 235,723 cattle and 76,914 sheep for 1887..... Numerous petitions are being circulated throughout Michigan, Minnesota and several other Western States asking the legislatures to repeal the law taxing mortgages. Borrowers and lenders are alike anxious for this needed reformation.....The Governor of Minnesota has secured the services of Prof. Lugger to visit farming communities in the northwestern part of the State and make a collection of frosted wheat from various localities for the purpose of having made, through the proper professors at the experiment station on the University farm, a thorough investigation by experiments in germination, by chemical analyses, etc., of its virtue for seeding purposes..... The Cornell University Agricultural Experiment Station, organized under the provisions of the Hatch bill, has just placed all the work of the station on fungus diseases of plants in charge of William R. Dudley, of the Laboratory of Cryptogamic Botany. He requests fruit-growers, farmers, gardeners, timber owners, botanists and others to aid him in intelligently laying the foundation of this work; .....The Illinois State Board of Agriculture has elected Prof. Geo. E. Morrow, of the Champaign University, as Secretary for the Board.....The war against the "Fertilizer Trust," is in full blast in Georgia. A large district convention of the Farmers' Alliance was held the other day at Columbus, and another at Athens, at which it was agreed not to buy fertilizers unless they could be obtained at the prices ruling last year. Recently dealers advanced prices.....Reports from 42 New-York State dealers show 326,000 barrels of apples on hand, of which only 15,000 have gone out. There are also 105,000 barrels in the hands of farmers. ..... The following farmers' institutes are arranged for Pennsylvania:

COUNTY.	PLACE.	DATE.
Lancaster	Lancaster	Feb. 5- 6
Chester	Kennett Square	Feb. 12-14
Northumberland	Milton	Feb. 14 15
Perry	New Bloomfield	Feb. 14-15
Adams	Gettysburg	Feb. 19-20
York	York	Feb. 21-22

Oleomargarine manufacturers are said to be introducing the unlawful commodity in this State by sending canvassers around to boarding houses and restraurant keepers, who agree to express the oleo in packages concealing its true character. Commissioner Van Valkenburg proposes to stop this illicit dealing also .....The Jacksonville Board of Trade wants a dollar a box tariff on oranges and lemons, and the Florida Senators and Representatives are asked to push the measure..... The Fourth Annual Meeting of the Dutch Belted Cattle Association will be held at the Cosmopolitan Hotel, New York City, February 14th, 11:30 A. M. Application for the registry of foundation animals must be made at the annual meeting to receive proper attention. H. B. Richards, Secretary, Easton, Pa..... Representative Burnes, of Missouri, received a paralytic stroke Wednesday, while in the House of Representatives, from the effects of which he died next day .....The tobacco growers of central New York assembled in large numbers in Baldwinsville on Saturday. Resolutions were passed asking Congress to protect growers by imposing a duty of 70 cents per pound on foreign wrappers and 35 cents on fillers; also in favor of the abolition of the war taxes on all forms of tobacco..... The meeting of dairymen and dealers at Springfield, Ill., was largely attended, and many encouring letters were received from all parts of the country. On motion of Mr. T. B. Wales, it was determined to organize a national dairy fair association, with a capital of $100,000, in shares of $25 each .....In conversation with some parties dealing in oleomargarine oil they had this to say, that the average amount of American oil used in Dutch markets ran about 3,100 tierces each week in 1888 and about 3,200 tierces in 1887. New shipments made this month averaged 4,665 tierces per week..... The annual meeting of the Connecticut State Board of Agriculture at Hartford recently elected these officers: President, Morgan G. Bulkely; Vice-President, Albert Day, of Brooklyn; Secretary, T. S. Gold, of West Cornwall; Treasurer, J. S. Kirkham, of Newington..... The Board of Control of the Massachusets Experiment Station met Wednesday to arrange an application to the Legislature for an appropriation of some $6,000 for a building in which experiments and investigations in vegetable physiology may be conducted, especially with reference to the causes of diseases of plants and how they may be prevented or removed.....

Crops & Markets.

SATURDAY, January 26, 1889.

Charleston (S. C.), January 22.—The News and Courier says editorially that day by day the cotton crop of 1888-89 assumes more generous proportions, and there are few who now dispute the fact that it will be the largest crop ever made. It seems not extravagant to hope that with the present outlook the crop will approximate, if it does not reach, the magnificent total of 7,500,000 bales.

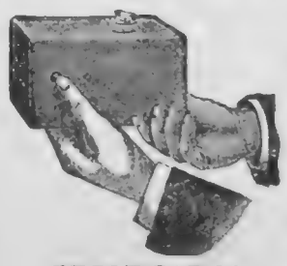
The Kodak.



PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

The Eastman Dry Plate and Film Co.,
ROCHESTER, N. Y.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

THIS was even so. Messrs. Brown and Jensen, having experienced some little difficulty in perfectly adjusting their private affairs, had decided to settle the difference in a fistic encounter. They had wisely selected Bryan's Mill as the place, and Saturday night before Easter, as the time. Tney had invited a few of their personal friends to witness the affair of honor, and were even now knocking imaginary chips from each other's shoulders.

This was a regular windfall of good luck for Jim and Ben. They decided to make the most of it, so they hurried back to the mill to look the ground over. They crept along the side of the building, and looked in through the cobwebbed windows.

I will venture to say that the great brown rafters that had held up the mill roof from its earliest history, had never looked down upon such a scene before. In one corner, where a cleared space in the piles of boards offered standing-room, the two young men whose bruised honor needed healing, were gazing defiantly at each other. Three lanterns blackened and smoky, hung from nails driven in the walls, throwing a greasy light over the bat tle ground.

Back on the dusty piles of lumber, the friends of the champions sat watching the affair with far more interest than the contestants themselves showed. Behind the audience the feeble light lost itself in the blackness of the mill. Here and there, some pieces of ancient machinery seemed to stand out from the shadow in angry protest against the unwonted invasion. Great rusty saws that had torn many a noble tree in pieces—yes, and shrieked with delight while doing it—now glared savagely at the youthful pugilists.

The battle had not become very exciting when Jim and Ben peered in at the window. Blood enough had not been shed to justify a call from the Drum Lake police force.

Messrs. Brown and Jensen were but following a well-established rule in their encounter. They spent so much time in preliminary arrangements, that now that the battle was really joined, they seemed hardly to realize it.

The first blow in such an encounter is regarded by many persons as an immense advantage. Each of the combatants, with a gallantry worthy of the Middle Ages, repeatedly invited his antagonist to take this advantage. Mr. Brown even went so far as to place a small chip upon his shoulder, and request Mr. Jensen to knock it away. Now Mr. Jensen could easily have reached this piece of wood, and he certainly possessed strength enough to knock it away, but yet he did not do so. Not to be outdone in politeness, he placed a chip of wood of even more convenient size upon his own shoulder, and requested Mr Brown to knock it away. When Jim and Ben looked in through the window, neither of the chips had reached the ground.

Both of the choir-hunters would gladly have stayed to witness the fight, but the thought of the waiting company at Cobb's drove such an idea from their minds. Jim, as manager of the expedition, made his plans for the attack as quickly as possible. He examined the audience on the lumber pile, and then whispered his directions to Ben.

"They is four boys in there that we kin git easy. They'll do the job in big shape. We'll crawl in the back door an' talk it over with 'em; but ef they run, jest coller any two an' hang onter' 'em.

Ben understood these directions, and the two men crept round to the back of the mill, and crawled in a most undignified manner through a hole in the wall. If they could only have reached the lighted space all would have been well, and Jim could have picked out his choir. But Ben, in his great anxiety to do his duty, and at the same time watch the progress of the fight, grew careless, and knocked over a huge pile of boards that lay in his path, which fell with a mighty crash that gathered volume as it swept through the mill. The angry saws clashed and rattled together as if to help swell the sound.

The noise fell with disastrous effect upon the ears of the audience on the lumber-pile, and the assembly vanished like a flash, every boy running for dear life, as if confident that the very fiends were after him.

By thus running, the audience lost the only real business part of the evening's entertainment. Emboldened by the noise or else bewildered by the loss of his audience, Mr. Jensen reached for the chip with such good aim that his fist ran directly against Mr. Brown's nose. Not to be outdone at this sort of thing, Mr. Brown sent his fist against Mr. Jensen's eye, and the ice being thus broken, they went at each other with great vigor.

At the first sound of the falling boards, Jim shouted "coller 'em, Ben, coller 'em!" and Mr. Stone at once started in wild chase after the audience, as if wishing to make amends for his carelessness. Jim leaped over the lumber and caught the two whose honor was being so rapidly vindicated. He pulled them apart, and held them by their collars at arm's length on either side of him.

"How goes it, Ben?" he shouted. "Hev ye gut 'em?"

"Wall, I ain't gut nothin' else," came the answer from somewhere far in the depths of the mill. In a very short time, Mr. Stone came clambering over the lumber pile with two more enforced candidates for the choir.

The quartette did not present a very promising appearance when brought into the light. I am forced to confess, that I, even with my slight knowledge of music, would have considered the prospect as decidedly dubious. Mr. Jensen's rapidly swelling eye and Mr. Brown's bleeding nose would be likely to neutralize any good effect the other members of the choir might introduce.

One of Mr. Stone's candidates evidently took his forcible nomination considerably to heart. "Lemme go," he whined, "I'll tell my father."

"Now, young fellers," said Jim in a tone of authority, "I've gut a job for ye. We're goin' over ter the Parson's an' yer go'nter be singers fer the next half an hour. Do jest ez I tell yer, an' I'll treat ye, when we git through, but ef ye whine, I'll boot ye." And he started the procession with Mr. Brown and Mr. Jensen on either side of him.

Mr. Stone followed with his candidates, and leaving the lanterns hanging on the wall to smoke themselves out in sorrow at the loss of the fight, the new musical organization moved in good order to the "Continental Hotel."

The choir marched directly into Mrs. McKelvey's kitchen, Jim and Ben relaxing their holds on the collars of the singers, though they kept a close watch upon them. The minister had not moved, apparently, from his seat near the stove. Mr. McKelvey had finished his potatoes, and was now engaged in slicing a large piece of pork. Mrs. McKelvey sat in the low rocking chair, try to induce the baby to go to sleep.

"Wall, Parson, here's yer singers," announced Jim, bringing his recruits up to the front, and placing himself near the door to cover any dash for liberty.

The Rev. Grayling felt his heart sink within him as he gazed upon the motley company. The choir did not improve in appearance when brought into the stronger light of Mrs. McKelvey's lamps.

Jensen's eye was well swollen by this time, and Brown's face, despite his frequent application of his coat-sleeve, presented a most blood-stained appearance. One of the Stone candidates had evidently started for the contest with a coat very much like the one worn by the minister. But during his frantic efforts to escape, the skirts of his garment, had by some accident, been torn away. As Ben afterwards confessed he "ketched him by the coat-flaps, and heared somethin' give." By reason of this curtailment, there was now exposed to view a patch of such extraordinary shape and size, that it seemed to reverse the regular order of things, and push its owner forward instead of permitting him to carry it.

"Ye can't tell nothin' about 'em frum their looks," said Jim, seeing the look of dismay on the minister's face. "Jest let 'em tune onct. When I gives the word, sing or ye'll know what ye'll ketch." It is needless to say that the latter part of this speech was addressed to the choir.

But Mrs. McKelvey at once vetoed this proposition, and the veto was most emphatically sustained by her husband. No doubt the new choir could render most delightful music, but her baby must go to sleep.

"Wall, Parson," said Jim, "thar's yer singers, an' I'll warrant 'em to do a good clean job, or ye needn't pay 'em a cent. We've done our part an' now jest shoulder yer fiddle, an' we'll show ye the way down ter Cobb's store."

The minister felt that the fates were surely against him. He had given his word, and could not break it, so he explained matters to the choir as best he could.

"My dear young friends, I am truly sorry that I am to be deprived of the great pleasure of hearing you sing this evening, but if you will call here an hour before church time tomorrow, we can doubtless arrange our music. You are acquainted with our usual Church service, I presume?"

Neither of the musicians seemed able to answer this leading question, so Jim spoke for them. "Yes, they be, Parson, I've heered 'em run it off a dozen times."

Mrs. McKelvey was very anxious to bring the rehearsal to a close. The baby was restless and excited at the sight of so many strange faces. "Wall, Parson," she said, "'adn't 'e better go an' git the fiddlin' done? We'll set up for 'e."

There was no help after this, and the minister rose with a sigh, and went in search of his melancholy hat.

"Now you fellers, clear out!" ordered Mrs. McKelvey when the door closed behind the minister. The members of the choir were only too ready to obey this command. Their exit was not characterized by that dignity that members of their profession should strive to maintain. Once on the outside, the organization dissolved never to be brought together again. Whether the singers went back to decide the contest or not, we cannot say. It is certain that the minister never saw them again.

"Now, Jim," Mrs. McKelvey urged, "I want you to look h'arter Parson, an' see 'im well used. 'E's a little man, an' don't h'understand the boys."

"I'll stay right by him, mum" promised Jim, "an' keep him right up ter the front."

THE VERMONT DAIRYMEN.

(*Continued from page 68.*)

The afternoon session was principally devoted to ensilage with an apparently unanimous feeling that it solved one of the chief difficulties of cheap and continuous milk production in this country. Several inexpensive methods of silo construction, (mostly of wood) and rapid methods of filling were described; and it seemed quite generally accepted that continuous filling and weighting, are unnecessary to the production of good silage. The paper of the session was read by Mr. John Gould, on the "kind of dairying for the times," and was a rapid and graphic recapitulation of the chief points of successful dairying according to the latest and most progressive ideas.

Following Mr. Gould, Mr. E. A. Harris, of Faneuil Hall Market, Boston, who had been employed to judge the butter exhibit, gave an explanation of the rules and principles which guided him in making his awards. In regard to salting, as he had given the highest number of points to many exhibits differing greatly in saltness, he explained that the public taste required these great variations, and that if the butter was otherwise good, and the salt clean, pure, and free from grittiness, he gave the same number of points, whether the samples were lightly or heavily salted.

At the business meeting following, F. D. Douglas, of Whitny, was elected President. Alney Stone of Westford, and J. C. Oliver, of Charleston, Vice-presidents, and E. L. Bass, West Randolph, was re-elected Secretary. Some amendments were also made to the constitution, chiefly to bring it into harmony with the requirements of the Legislature in making an appropriation in aid of the association's funds.

On Friday morning, E. F. Bowditch, of Framingham, Mass., discoursed interestingly on "Why I Chose Guernseys." The gist of his story was that after trying Jerseys for a number of years, he discovered that in winter it was often necessary to color their butter. This being a proceeding unpleasant to himself, and seriously objected to by his customers, he was led, by hearing that the milk of a single Guernsey had distinctly improved the color of the butter of a number of cows with which it was mingled, to make a journey to Guernsey for the purpose of investigating the subject. Finding it to be the fact that the butter of this breed was always sold without any coloring, and that it possessed a color that was matched by the butter of Jerseys only by the addition of coloring matter, he purchased a herd of these cattle, from which his present herd has descended. Though a larger and by far less uniform breed than the Jerseys, he has found the Guernseys to quite equal the latter in productiveness for the butter dairy, and has never had the slightest inclination to return to the Jerseys. Among other matters elicited by the questions of his auditors, Mr. Bowditch gave an account of his method of breaking his Guernsey bulls to the yoke, and thus, besides making them exceedingly useful on the farm, rendering them entirely docile.

In reference to feeding his cows, he uses little besides good hay with corn-and-cob meal as feed, in addition to pasturage. He is very strongly opposed to cotton-seed-meal, not only for cows, but for any kind of stock. He approves of linseed-meal, but feeds it only occasionally, in a sort of medicinal way.

After some interesting account of Western dairy schools and conferences by Mr. John Gould, Dairy Commissioner Brown, of New York, occupied an hour in describing the progress of the dairy interests in that State, especially the active crusade against oleomargarine. He also described the method of conducting the agricultural institutes and dairy conferences, and referred to the proposed legislation in regard to the skim-cheese manufacture. He declared that in New York cotton-seed-meal is most extensively and successfully used by the dairymen, with no prejudice to their products, but with a vast improvement in the quality of the manure. He also referred to the small attendance of ladies here, and informed his hearers that the farmers' wives in New York are pretty good farmers themselves, and are numerously in attendance at such meetings, and extremely interested in the proceedings. But Mr. Brown gave us, too, some of the dark shades in the dairy of the Empire State, saying that the extensive statistics gathered in at his office proved that the average milk yield of the cheese cows of the State but slightly exceeded 3,000 pounds. These unpleasant conditions of the business, he said, had first to become known and realized, and should then be earnestly amended. It was necessary to find out all about every individual cow, by a careful record of her daily yield. Weigh the milk, and learn its quality. Unless the milk of each cow can be made to reach at least a minimum of 5,000 pounds annually for the cheese factory, or enough to make not less than 200 pounds of butter, the inferior cows should be got rid of at once, as they are being supported at the expense of the more profitable members of the herd. He insisted on the importance of procuring good thoroughbred bulls, and of feeding the calves and heifers from the start with the kinds of food which will develop the tendency towards deep and rich milking. It costs, he said, not less than 15 cents a day to feed a cow; and it makes an immense difference whether she runs dry 100 days or half that time, a difference which may cut down the profits to nothing, or less than nothing. He wound up by a most wholesome advice to every dairyman to consider his customers' interests, and to look upon them as his best friends, whose interests should be considered as carefully as his own. This was, he said, a principle in mercantile business among all honorable and successful dealers, and the farmer, being essentially a business man, should adhere closely to business principles.

Some concluding remarks were made by Mr McPherson, of Ontario, upon the importance of increasing the fertility of dairy farms by the use of rich feeding stuffs, and the careful saving and intelligent use of the resulting manurial matter. It is following the true commercial principle, which teaches us to buy in the cheap market and sell in the dear, which we can do by feeding liberally of that class of feeds from which we can extract their entire cost in the milk of the cow, and retain an equal or greater value in the fertilizing matter returned in the residuum. H.

CATALOGUES, ETC, RECEIVED.

PATENT "EAGLE" ANVILS.—Circulars from Fisher & Norris, Trenton, N. J. It is claimed that these anvils are made of the very best material, and in the best possible manner. The body is of gun-metal—which neither settles nor breaks The face and the horn are made of the best tool-cast steel welded so perfectly to its place that it is warranted to remain there. This anvil is in use by hundreds of our best blacksmiths and mechanics.

DELAWARE HORTICULTURE.—Bulletin No. 20 from the Delaware Experiment Station. In this pamphlet Prof. Beckwith outlines the work that he proposes to do in his department the coming year.

ASPINWALL POTATO PLANTER.—Catalogue from the Aspinwall Manufacturing Co., Three Rivers, Michigan. This is a new pamphlet descriptive of an old and well-tried machine. Our readers know that we consider this machine one of the most ingenious labor-saving devices ever originated.

C. N. DEMPWOLF & Co., YORK, PA.—Circular of fertilizers, poultry food, etc. Send for it.

HAMILTON MILK JARS.—Price list from W. Hamilton & Co., Pittsburg, Pa. In every city and town in this country there are people who are willing to pay 50 per cent above the price of ordinary milk if they can be assured that they are buying a pure and clean article. As a means of securing this trade, glass milk jars are indispensable. A good many milk men have discovered the secret of securing the extra price and we may say that all such use glass jars to supply milk to their customers. We may also say that the Hamilton jars are as good as any.

HENCH & DROMGOLD, YORK, PA.—Circulars describing Hench's improved riding or walking steel cultivators. These circulars contain cuts, testimonials, etc., and are full of interesting reading for farmers; send for them. This firm has in contemplation a new and improved spring-tooth harrow. The reputation of the firm is a guaranty that it will be a valuable implement.

N. C. BAUGHMAN, YORK, PA.—Circular of the celebrated Becker washing machine, one of the greatest indoor labor-saving devices of the age.

EXPERIMENTS WITH SORGHUM.—Bulletin No. 5 from the Kansas Experiment Station, contains two reports that ought to interest Kansas sorghum growers. Prof. Failyer has made some comparisons of varieties of sorghum with a view to determining the most valuable variety for the Kansas farmer—considering size, quality, feeding value of by products, etc There is a table giving the results of this test. Prof. Kellerman contributes to this bulletin an article on Sorghum Blight—a disease discovered on the college farm last summer.

TUBERCULOSIS.—This is the title of Bulletin No. 3 issued by the Massachusetts Experiment Station. It was prepared by Prof. C. H. Fernald in response to many demands for a brief and comprehensive account of this disease. The pamphlet has evidently been prepared with a great deal of care, and will be of much value as a reference book for cattlemen and farmers. That our readers may obtain an idea of the scope of the work, we give the following list of the various topics discussed.

1. Animals attacked by tuberculosis.
2. History of tuberculosis.
3. Distribution of tuberculosis.
4. Is human tuberculosis contagious?
5. Is bovine tuberculosis contagious?
6. Is human tuberculosis communicable to lower animals?
7. Is bovine tuberculosis communicable to man?
8. Are human and bovine tuberculosis identical?
9. Is bovine tuberculosis hereditary?
10. Symptoms of bovine tuberculosis.
11. Is it curable?

An examination of this list of contents will show that the subject is exhaustively treated.

"OHIO" ENSILAGE AND FEED-CUTTERS.—Catalogue from the Silver & Deming Manufacturing Co., Salem, Ohio. The manufacturers of this cutter believe they have a machine that can be relied upon to stand any reasonable test. Sensible farmers will appreciate the following statement made by the manufacturers of the "Ohio."

"In regard to the capacity of our cutters we will not use the words of a competitor: 'They will cut twice the quantity, size for size, of any other make in the world,'—because that would be mechanically impossible, in any well constructed machine over another. We will say this, however (and can substantiate the same by many actual tests), that our power cutters are heavier and stronger, consequently more durable than other machines with the same cutting surface; they are more convenient, easier to operate, less liable to breakages, and will do more work, size and price considered, than any other cutters manufactured."

This catalogue contains some excellent advice to those who are interested in silos.

AYER'S CALENDAR.—This calendar is received from N. W. Ayer & Son, Philadelphia, Pa. It is an elegant affair—one of the best we have seen. It is sent for 25 cents to any address.

EUREKA SPRING-TOOTH HARROW.—Catalogue from the Eureka Mower Co., Utica, N. Y. This is a new implement. The manufacturers state that many farmers have objected to ordinary spring-tooth harrows, for the reason that they wear out quickly and are horse-killers. The Eureka harrow was designed to overcome these objections, and after a thorough testing in rough fields it is confidently offered to the public. Our readers are invited to examine this harrow. It is well to keep informed regarding new implements.

THE POST OFFICE CLUB.

UNCLE JACOB has not had much to say of late at our meetings. The arguments of the parrot have been a little discouraging to him. Anyway he likes to let others talk first while he sifts the arguments and sums the thing up.

The parrot has grown bolder than ever Many things have gone to suit him of late. A good many auction sales have been held, and goods have been just about given away. This, to the parrot's mind is a sure indication that New Jersey agriculture is in a very poor way. So the parrot felt that he could afford to strut on the stove pipe and put a little extra force into his favorite argument.

"*Farmin' don't pay! Farmin' don't pay.*"

Uncle Jacob rubbed his head reflectively as he listened. The parrot, as usual, repeated his remark.

"Vell, vell" said uncle Jacob at last, "der fact vas dot somebody can't tell shust what brofits mit farming vas, so dot it vas a hard job to figure mit der brofits out. Dot man dot vorks mit der city in, und draws his pay effery veek or mond, vas seem to get more dan der farmer, und yet at der end off der year, how much more vas he haf left mit his bocket? I haf a frient dot vorks mit der city in. Ve vas poys togedder, und ve vas shust apout der same age old. I goes mit him mit a visit effery vinter, und he goes mit me mit a visit effery summer. Vell, vell, dot feller vas always worry about his yob und his rent und all dese oder tings. He haf a little money safed up, but not enough so dot he could stop vork und lif quietly und vell till death vas come. He says now dot vile he vas growing old und veak, yunner men vas come along und take his blace avay. Now den, I vas nefer go in mit style mit my life, but I have a goot home dot vas my own und nopody vas throw me out mit a yob. I vas an independent man, anyvay, und my home vas secure mit me vile I lifs, Dot friend off mine would not shange mit me 30 years ago, pecause der goundry vas too quiet und dere vas no money mit farming, but now he vishes dot he vas haf my home und my beace off mind. Maype dere vas not much money mit farming, but dere vas some *pay* anyway."

The parrot listened attentively, and when Uncle Jacob stopped to sneeze it filled up the spare time with:—

Farmin' don't pay! Farmin' don't pay!

Humorous.

A SUITABLE REASON

"WHAT is the meaning of this throng
In yonder clothing store?
There surely must be something wrong—
What are they gathered for?"

"The cause is plain it seems to me,"
Replied the passing wit,
"Some person in there, don't you see,
Is taken with a fit!" —*Puck.*

A person who serves us through fire and water—the cook.—*The Vineyardist.*

CHILDREN shrink from being washed. The same may be said of socks.—*Yonkers Statesmen.*

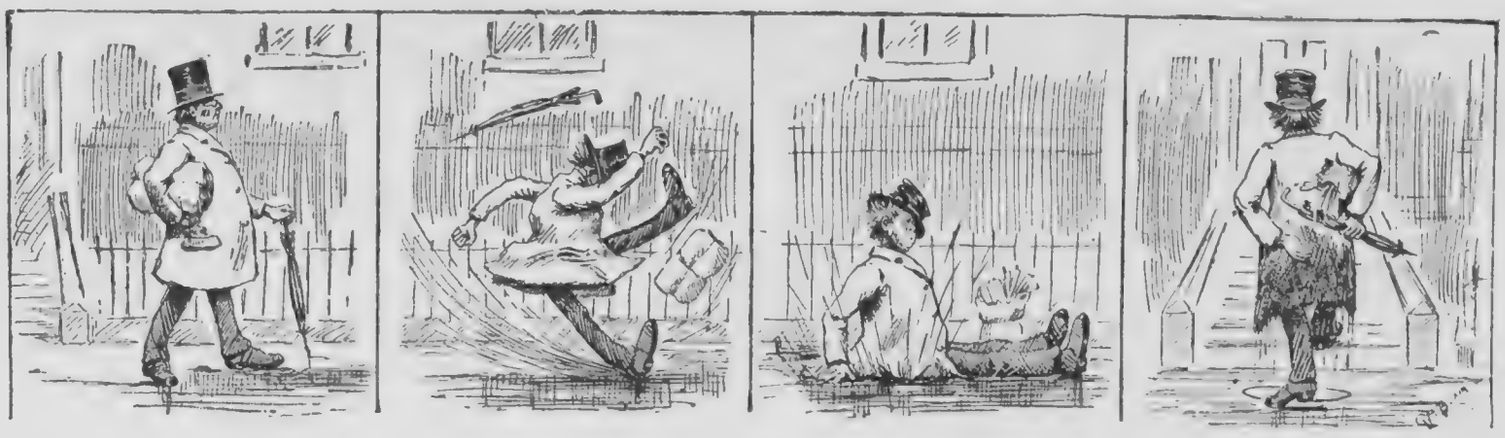
A MACHINE for pressing hops has been invented. America is the home of the hop-pressed.—*Texas Siftings.*

"MUST the churn go?" asks the New York Tribune. Why, of course it must if it is after butter.—*The Empire.*

WHY is a general housemaid like a boot? Because one is maid of all work and the other is also made of awl work.—*Field and Farm.*

LECTURES on North Pole are generally slow. The speaker does not seem able to warm up to the subject.—*New Orleans Picayune.*

WHEN a bald-headed man removes his hat to salute a lady, it does not remind one of a leafless branch, although its a naked bow.—*Salem Standard.*



What beautiful weather! Just like spring! — Swish! — Whash!! — Don't know but it feels more like fall, though, after all!

I Cannot Find any other medicine that does me so much good as **Dr. Seth Arnold's COUGH KILLER.** Mrs. Susan Abbott, Fairlee, Vt.

AN INTERESTING PAGE.

FROM U. S. COMMISSIONER OF AGRICULTURE, NORMAN J. COLMAN.

"But the Editor of the R. N.-Y. does not stop at testing new varieties produced by others, but is producing new varieties himself, and has accomplished wonders in hybridizing. He has opened an entirely new field for investigation, the possibilities of which cannot be conjectured."

FROM THE FARM JOURNAL.

"His farm and his home were turned into experiment grounds in the interests of his journal, and the results of careful and expensive experiments made have been freely given to the world."

FROM THE N. Y. TRIBUNE.

"The R. N.-Y. has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations."

A SYMPOSIUM

—FOR—

Every Week During 1889.

FROM THE AMERICAN AGRICULTURIST OF JUNE, 1888.

"Crops of 100 bushels of shelled corn are rare. We have seen on the farm of the Editor of the R. N.-Y. a crop of 134 bushels of shelled corn raised on one acre of ground."

$1,000 IN SOUVENIRS

—FOR THE—

Women's National Potato Contest

FROM THE GARDENERS' MONTHLY.

"The RURAL's Experiment Grounds furnish many of the facts which render it so popular."

FROM THE HARTFORD COURANT.

"Everything is an experiment here. The merest catalogue of these experiments for the garden, nursery and orchard would fill a volume."

FROM THE AMERICAN GARDEN.

"The success of the 'Potato Contest' of our friends of the R. N.-Y., has stimulated several publishers and manufacturers to the offering of large money prizes for crops to be raised during the coming year"

FROM C. V. MAPES.

"Please note the unusual array of prizes offered in the country this season for the best results from potatoes. The one who obtains the largest yield of potatoes will receive almost enough to buy a small farm. This unprecedented interest in potato culture is largely due to the efforts of the R. N.-Y."

FROM AGRICULTURAL SCIENCE FOR JANUARY, 1888.

"The R. N.-Y., so far as we know, is the only agricultural journal in the world that has experiment grounds established for the benefit of its subscribers."

FROM COLMAN'S RURAL WORLD.

"The R. N.-Y. has made an undoubted cross between rye and wheat. It has also hybridized the blackberry and raspberry. Different species of roses it has also crossed."

FROM E. S. GOFF, OF THE NEW YORK AGRICULTURAL EXPERIMENT STATION.

"I wish to congratulate you on your potato, the 'Rural New-Yorker No. 2.' It yielded best here the past season of 67 varieties; bore the smallest proportion of small tubers, and, so far as the varieties have been tested, it is the best in quality of all. I predict for it a great future."

FROM THE N. Y. WORLD.

"The latest hybrids between rye and wheat growing on the grounds of the R. N.-Y., develop many curious freaks, while those of previous years are still changing in a wonderful manner."

FROM LIEUT. GOVERNOR, EDWARD F. JONES

"Binghamton, N. Y., Dec. 29, 1888.

"EDITOR RURAL NEW-YORKER: The Rural New-Yorker of December 29 is before me, and its effect on me is to impel me to express to you my sincere wishes for a Happy New Year for yourself, and continued success for the Rural, which, when contrasted with the agricultural papers of 25 years since, not only shows the improvement in the paper itself, but also illustrates the progress made by the agricultural class, much of which is due to the inspiration of the Rural New-Yorker, and such of its contemporaries as follow its example."

FROM THE AMERICAN GARDEN.

"We wish that every lover of gardening could see the garden home of the R. N.-Y., which has been so great a help to thousands of farmers and gardeners the continent over."

"The Rural New-Yorker is published for progressive intelligent farmers."

FROM EX-COM., GEN. W. G. LeDUC.

"The Rural New-Yorker strives to do good."

COME WITH US, PROGRESSIVE FARMERS,

LET US WORK TOGETHER FOR AGRICULTURE. ENTERPRISE AND PROSPERITY!

Our lady friends continue to send in their names freely for the Potato Contest. It will be a NATIONAL Contest indeed.

GEN. WM. G. LE DUC: "The efforts of the R. N.-Y. are always based upon something for the benefit of the farmers."

The Rural New-Yorker Potato No 2 will be sent to all of our Yearly Subscribers who apply, without any charge whatever. It will be sent, as the weather permits, from time to time, so that all shall receive a tuber before the planting season commences. Applications are now in order.

SECRETARY J. S. WOODWARD: "The Women's Potato Contest is a good work."

HENRY STEWART: "The Women's Potato Contest is an excellent thing."

DR. C. V. RILEY: "The Women's Potato Contest has my entire sympathy."

PRES. P. J. BERCKMANS: "I cheerfully advocate the scheme."

PETER HENDERSON: "I am glad to hear that you are going to engage the ladies in your potato contest, and have not the least doubt that it will be a success."

Applications for the R. N.-Y. Potato No. 2 must be made upon a piece of paper separate from all other communications, and the name and full address of the applicant must be given. The offer is necessarily confined to Yearly Subscribers or those who may become yearly subscribers.

MRS. A. BATTLES: "I am certain the Women's Potato Contest will be very interesting and of great benefit to agriculturists at large, and help carry out what the R. N.-Y. has so ably commenced, viz.: improved methods of cultivation and the introduction of better and more prolific varieties."

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII NO. 2037. NEW YORK, FEBRUARY 9, 1889. PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered According to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

The Herdsman.

PURDUE PREMIER.

THIS magnificent two year old Holstein bull, shown at Fig. 27, stands at the head of the herd owned by Purdue University, Lafayette, Ind. He was dropped May 23, 1886, and weighs at the present time 1,800 pounds. His sire was Promoter (2004), owned by J. W. Stillwell & Co., Troy, Ohio. His dam, Manada (9693), was purchased in the spring of 1886. She was bred by J. Waiboer, Barsingerhorn, N. Holland, and imported in 1884.

Entomological.

CHINCH BUG DISEASES.

(*See page* 86.)

MUCH interest has been manifested in Iowa, Illinois, Minnesota, and Ohio during the past summer and fall concerning widespread "epidemic," diseases among chinch-bugs. Dr. Lugger, in a recent bulletin of the Minnesota Experiment Station, gave an illustration representing a bug attacked by the disease, together with an account of the nature of the disease, and its distribution over the State. Prof. Forbes, of Illinois, has reported chinch-bug diseases prevalent in that State, and nowBulletin 3 of the Iowa Experiment Station comes to us with an account of the epidemic as observed in that State the past season by the station entomologist, C. P. Gillette.

Fig. 28 is a life-size representation of a number of the chinch-bugs that have been destroyed by a fungus (a species of Empusa) which has almost entirely destroyed these insects in parts of the State. The white spots upon the leaf represent the bugs as found either partially or entirely covered with the mycelial threads of the fungus. The dark spots on the white are chitinous portions of the insects that the fungus can not penetrate and which in most cases remain uncovered.

The disease was first noticed at the Iowa station about the first of August, when the bugs were very numerous. Old and young were equally subject to attack. It was found by experiment that the disease was readily communicated from diseased to healthy bugs when the necessary conditions of warmth and moisture were obtained, but in dry, exposed places the disease would not spread, no matter how abundantly the disease germs were scattered about.

At the close of an article is given the following

PRACTICAL SUGGESTION:

"It will be understood from what has been said that on low ground and among thrifty, growing crops that keep the ground well shaded, chinch-bug diseases will be most common. Then, other things being equal, put those crops subject to chinch-bug attacks on low places; see to it that the ground is well prepared for the crop, and use seed of most thrifty-growing varieties. I also think it advisable, as it can be done at so trifling an expense, to preserve quantities of dead bugs to be used if necessary in the future, either in one's own locality or to be sent to some distant spot where the disease has not yet appeared. To preserve the disease, cut grass or other crops where the dead bugs are abundant, thoroughly drying the same, and then inclose in paper sacks and store in a perfectly dry place until needed."

Horticultural.

RAISING LIMA BEANS WITHOUT POLES

(*See page* 86.)

MY plan of growing Lima beans for market is shown at Fig. 29. I have never seen or heard of such a way in any place except my own, so I suppose it is an original idea. It is certainly the cheapest way of growing beans that I have ever heard of or practiced. I commence by getting three posts nine feet long—one for each end and one for the middle. With a post-hole digger I dig holes four feet deep so that the posts will fit in snugly. After a post has been put in, the earth around it is rammed solid. By making the holes deep, there is no need of bracing the end posts. The sketch represents one section of a row 300 feet long, with one end post, and one of the several small stakes sharpened at the bottom end, and driven into the ground 25 feet apart between the posts. These keep the wire from sagging. The wire should be fastened at the top of each post, (I use staples) drawn tightly and fastened to the other end post; then it should be placed on the middle post and stakes and staples should be driven on the top of them to keep the wire from slipping off. I plant the beans 18 inches apart, two together, in the row, directly under the wire. When the vines get large enough to put out tendrils, I take common wrapping twine (cotton), fasten it to the top of each end post, then carry it down and give it one turn under the leaves of the plant, then over the wire and down to the next plant, and so on until the row is completed, drawing the cord tolerably tight from plant to wire. Then I go over the row and entwine the tendrils around the cord. In a few days they will have taken hold of the wire when the hardest wind will not break them loose. When frost has killed the vines in the fall, I take a knife and cut them from the wire and lay them neatly lengthwise of the row, and with a plow throw a furrow or two on them, and when planting time comes again they will have rotted and will have made the best manure for another crop, with the addition of a little guano. I never change the rows, but plant in the same rows year after year.

E. T. IVY.

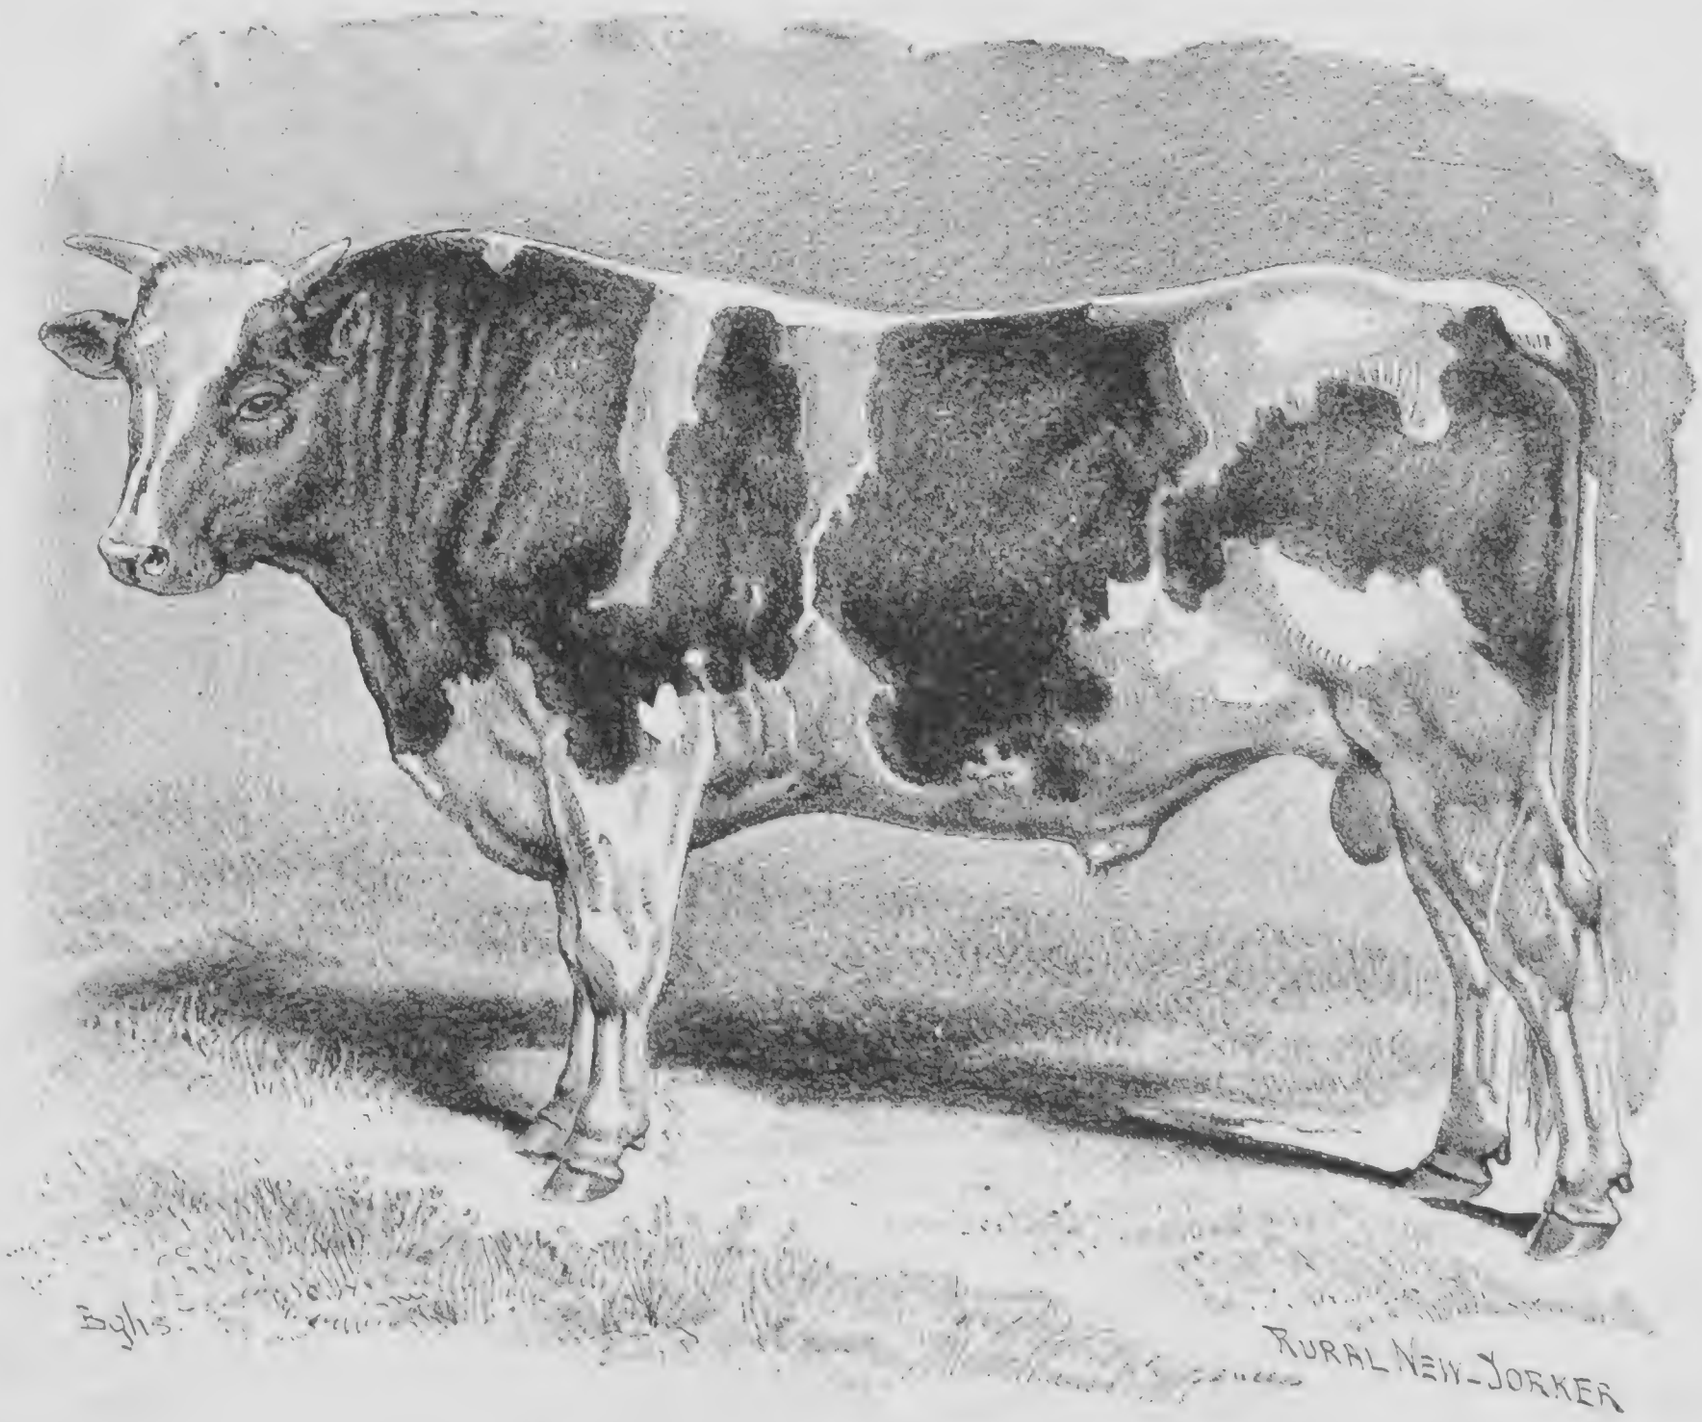
The Poultry Yard.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

ABOUT POULTRY.—I believe that more money, much more, has been lost in attempts to make yarded poultry pay than has ever been made out of it as a business, though I am aware that some skilled advertisers do well at it. The poultry business is a good deal like women's work, about which there is so much discussion as to starvation prices. The average working woman has to meet the deadly competition of hosts of other women who are in part supported by male connections, and can therefore cut under the wages of women dependent entirely upon themselves. If it were not for the immense amount of work done by partly-supported women, at less than real cost, the working women who must live on their wages would get much better rates. So it is with those who go into poultry. They have to meet the competition of the farms, where poultry and eggs are "by-products," so to speak.

FARM POULTRY.—But farm poultry, say the hen fanciers, and farm eggs, are far inferior. Sometimes, and sometimes not. When rightly managed, farm poultry and eggs are superior to yard products, and much more cheaply produced. Within due limits, the poultry and eggs from farm flocks cost less than half those from the yards? On our average farms, where the flocks rarely exceed a fowl per acre, nearly all their summer food costs even less than nothing, for the flocks of young poultry, during the summer, consume a large quantity of injurious insects and weed seeds, besides being a decided benefit in scattering the droppings of cattle evenly in their search after grubs. Fowls that have free range are healthier and, when cared for, make a better growth, and fatten to a greater weight.

FARM POULTRY IMPROVING.—It will not do to sneer at the quality of farm poultry. Thanksgiving week I noticed, in a village street, a load of dressed Plymouth Rocks selling at 15 cents a pound, and netting the farmer who brought them in $1.50 a pair.



HOLSTEIN BULL, PURDUE PREMIER. Fig. 27.

They went off "like smoke," too, buyers seeming to prefer them to turkeys. In good locations, not far from cities, farm eggs bring quite as good prices as yard eggs; and on the poorer, sandy farms, poultry products are as much (or more) an item of profit as dairy products. Farm poultry is almost exclusively in the hands of the female members of the family, and although they are somewhat curtailed in the allowance of grain to finish them off with in the fall, yet examples, like that above, of the large price that well-fatted and skillfully dressed fowls will bring, even in the smaller markets, are tending to more liberality in this particular.

THE PROFITS.—As a main business, especially for men, except in very exceptional cases and under peculiar conditions, I repeat that it will not pay. Even on the farm it rarely pays, except on the moderate scale above indicated, where waste products and women's work are utilized. Attempts made on farms to unduly increase the flocks almost invariably result in loss. But when the true limits are understood, and the right conditions observed, a real, honest, net profit of one dollar per head may be reasonably expected in the ordinary way. Where particular skill is shown, and a wide neighborhood reputation for superior stock is gained, even more is sometimes gained.

TURKEYS AND DUCKS.—Some of our bright farm women have a real talent for raising turkeys, and although these fowls are more troublesome to the farmer than hens, wander farther, and must be more often confined, and more closely watched, yet there is some money in turkeys for some people. The same may be said of ducks. But the duck business is a trade, quite as much as the turkey business, and requires special facilities, as well as special skill in the breeder. Young ducks are much hardier than young turkeys, require less watching and can take better care of themselves. I have a duck-breeding neighbor who is particularly well located and well skilled in the art, and makes it pay. He has a slow river running close by his house, with half a hundred acres of swampy meadow on both sides of it. On this river, and in these meadows, his flocks of young ducks have nearly the same conditions about them as their wild congeners have in the wilderness, without some of the dangers. He feeds his flocks with grain in his door-yard every night, and it is a sight worth looking at, when the long squadrons come sailing down the river at night-fall for their rations. Ducks, yarded, will "eat you out of house and home;" but here hundreds are brought nearly to maturity before much expense is incurred.

PRICES ADVANCING.—The surest proof that I am right in my belief, that, as a single business, poultry-keeping rarely pays, is the continual advance in the price of eggs. Even at a distance of more than a hundred miles from any considerable city, eggs have averaged over 20 cents a dozen, the season through, for 1888. Now with all the poultry journals, the poultry departments, the constant pressure of sanguine people into the business for years, pray tell me why, among all other lines of country profit-seeking, poultry is the one only line that cannot be over-done? There was a glut of small fruits, there is a glut of apples and oranges, there is more often than not a glut of every sort of farm product; but never a time when there is not a brisk market for eggs. A sarcastic neighbor of mine insists that the rarest product of the poultry-yard is eggs. Undoubtedly the great bulk of the egg production is from the farms; but why does this not keep pace with the market? Some one tells me that cheap novels, story papers and parlor organs are diverting our women folks from their former interest in poultry. If this is the case, the men-folks ought to see to it that the inducements in that direction are increased.

HOW INCREASED?—I should say that the best way to stimulate the business is to see that every reasonable facility is afforded for it, in constructing houses and yards, in doing the things most difficult and unpleasant for women to do, and in allowing a reasonable quantity of feed, when needed. Let the poultry not only be made to pay, but see that this pay goes, in a due and just proportion to those who have the chief responsibility for its success.

MAKING HENS LAY.—A hen has to lay. You cannot keep a healthy hen from laying if you try, unless you kill her. No medicine is required for the purpose, and on the farm no special feeding, no drugs, ground bones, oyster shells, or anything whatever but plenty of natural food, clean water and comfortable quarters, to get all the eggs that the breed, be it this or that, naturally will produce, under proper conditions. And, beyond that, it is as impossible to force them as it is unnecessary to try. Hens don't average any more eggs now, if as many, as they did fifty years ago, when patent hen-food was unthought of.

TO WHAT WORK WILL WELL-HANDLED HARROWS HANDILY HITCH?

QUESTIONS.

1. *If you could get but one harrow, which one would you choose for general farm work?*

2. *Is the work done by the various harrows so different that two or three can profitably be employed on the same farm?*

3. *What special operations are the smoothing, disk, spring-tooth and Cutaway harrows used for in your neighborhood? What is the best work for each?*

4. *Can you suggest any improvement in the construction of harrows, that would make them more serviceable.?*

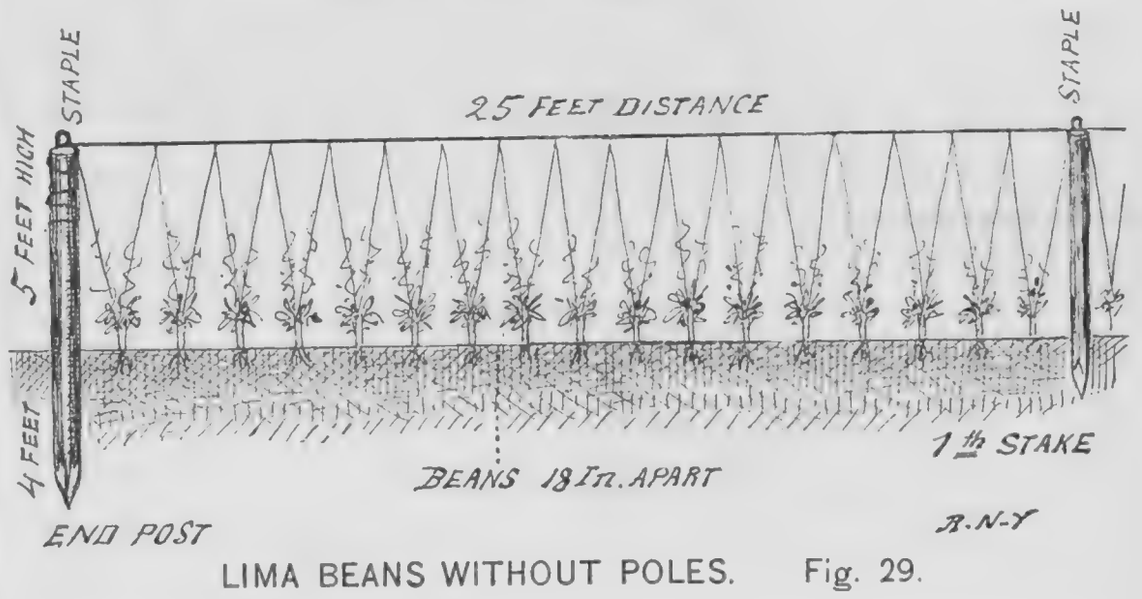
MICHIGAN MENTION.

I can hardly say too much for the Cutaway harrow. I thought the disk a great acquisition, and destined to displace most others, except the smoothing, which is for a different purpose; but the Cutaway is ahead of the disk. It is admirable for cutting up any soil, and in case of plowed greensward, it does not tear up the sod in the least. Last spring I fitted my oat ground with the Cutaway in lieu of the plow at a great saving of time and labor; every farmer knows how precious time is at the time of oat seeding. I put oats after corn, and follow with wheat. Pleased with the ease and rapidity of fitting, I waited eagerly for the harvest, to see what it would be. The season was quite dry, especially late, and yet I had a fine crop of oats But now the question arose how about plowing for wheat. The summer and fall were exceedingly dry, and I had some misgivings about breaking the dry, hard soil, especially as it was a clay loam. To my delight the plowing for wheat was in no wise difficult. I could not help seeing that the work was done with as much ease as usual. The only question remaining was as to the wheat. The other day I drove across country 28 miles, and I did not see a piece of wheat in the whole journey that looked as well as mine. So I say tally one more for the Cutaway. I have found a new and valuable way to fit my oat ground, which will greatly hasten work in the hurried spring season. A. J. COOK.

THE HARROW FOR THE PIEDMONT BELT.

STARTING just after the war with a forked tree, with a few wooden pins driven through at intervals, for a harrow, I have handled almost every kind on the market, and now have narrowed down to the Cutaway and new lever harrow with angle-steel frame, and as the Cutaway is more a plow or spading implement than a harrow, it may be seen that I have chosen the new lever for harrowing as it is as nearly a perfect harrow for general farm work as I could suggest. The 60-tooth or two-horse-size harrow is in two sections cutting 10½ feet, and can be conveniently changed to two one-horse harrows for use on very rough or stumpy land. The adjustable arrangements are so simple and perfect that the harrow can be changed to any one of a half-dozen different styles without stopping the team, or it can as easily be thrown down on its bars, teeth off the ground, ready to move from place to place on its runners without damage to the teeth, and in this position the steel cross-bars scrape the plowed land as smooth as a steel rail, and the implement is not so heavy or inconvenient. This angle-steel frame harrow weighs just the same as a wooden-framed tool of the same size, and is preferable even at an additional cost of $3.00 or more, on account of its teeth being securely fastened.

If properly understood and used both the Cutaway and new lever harrows are profitable investments on any well-managed farm, and both do not answer the same purpose except in the operation of covering grain on recently plowed land, and if the land is a little compact from rain or long standing, the Cutaway is the implement to be used. The Cutaway or disk harrow pays me best in spring, just before planting on land that has been fall or winter plowed. No other implement can do the work so perfectly or make such a saving of both horse and man power at this busy season. J. C STRIBLING.



LIMA BEANS WITHOUT POLES. Fig. 29.

HARROW VIRTUES AS VIEWED IN VERMONT.

1. I have not tried all sorts of harrows, but of those I have tried I should prefer the Acme as an all-round tool. I could not think, however, of farming with but one harrow, however good.

2. Certainly. The disk, the Cutaway, and the Acme, though they do deep and thorough work, put in small seeds too deep on broadcast sowings. They will not do the work of a smoothing harrow, or of a chain harrow, or in rough, new land, of the old, three-cornered, spike-tooth harrows. The spring-tooth harrow I have never used.

3. The Acme, disk, and Cutaway harrows are invaluable for preparing a turned sod for crops, for fining heavy soils, for burying stable manure, and mixing that and other fertilizers evenly with the soil, and also for slaying weeds on a fallow. The smoothing harrow is essentially a small weed-killer, or as an implement to work across the rows in drill culture its usefulness is unequaled, and there is no substitute. For rough, newly-cleared land, where roots, stones and stubs have to be dodged, the old A harrow must still find a place. For a harrow that will bug the ground, and follow all the inequalities on a "hummocky" field, the chain harrow is a good invention, especially for covering broadcast seedings, where other harrows, by dragging clods and trash into the hollows, bury much seed too deeply. I think perhaps the Cutaway may do this work better still.

4. Nothing, except more thorough workmanship, the use of better materials, and the uniform system which makes broken parts easily replaceable. T. H. HOSKINS.

AN OHIO OUTFIT.

1. If I could get but one harrow, I would take a Cutaway, for not only could I do all the harrowing, but at least one-half of the plowing with it, such as putting rye on corn stubble and oats on fall-plowed land in the spring. No harrow made to-day does its work so well and thoroughly as the Cutaway, and with that and a plank drag a man can keep ahead of his harrow work "and not half try."

2. The work is not so different on the farm that a dozen harrows need be bought. The trouble is to get one that will "go through" what there is to be done, and not clog but cut, slice, turn and pulverize, without killing the team and making the man broken-backed by lifting and clearing the harrow while at work.

3. A Thomas smoothing harrow can be very profitably used on a farm as an implement to finish up with before planting, dragging corn, fining manure on top-dressed land and like jobs. Since I purchased the Cutaway two years ago there has been a thinning out of drags and harrows on my farm and a sale of a No. 1 disk, and the harrowing is now all done with the Cutaway and a Thomas, and I simply smooth down with a plank drag.

3. The smoothing harrow, of course, is a finishing up machine. The disk has not in this immediate locality become popular, but those who use it do so to promote deep working of the soil, and if the soil is favorable, they "wheel in" the oats on fall-turned land The Cutaway is now being introduced, and its best work is done on almost any place where it is tried. Its draft is so light that it does good work, for the notches in the disks turn it into a "spading" machine, and it works down and deeply where a spring-tooth or a solid-wheel disk would do only slight, or unsatisfactory work. I find its best work is in superseding the plow in many things where it would be impossible to work spring-toothed harrows or the disk, without heavy weighting especially in sowing rye on ensilage stubble land, saving the plowing, etc., and doing effective and perfect work, putting in wheat after potatoes and early spring grains, completing the work satisfactorily before it would be possible to plow the same land.

4. Suggestions in the way of improvements in the harrow can be more easily made than carried into pratice. The improvement needed in drags is to get them to go down into the soil and do good work at the bottom of the furrow and far less of surface smoothing. The drag of the future must be lighter, stronger, and of less draft. The greatest improvement that could be devised for a harrow would be an attachment that would make it impossible to use it off the farm, and thus prevent its being worn out by borrowing neighbors. JOHN GOULD.

ANOTHER VERMONT MAN.

1. If I could get but one harrow for general farm work I would have the Child's spring-tooth.

2. For a second harrow to follow a spring-tooth, as a smoothing harrow, I would choose the Thomas.

3. I consider a disk harrow good for working up fall-plowed land, or in fact any hard, clay soil that has become packed by snow or heavy rains. The smoothing harrow is the most essential of all harrows, and I judge the least used by the looks of the meadows that I have seen in my travels. The spring-tooth is a very important implement in preparing the ground for planting, and when it comes to cultivating orchards, it has no equal in my esti-

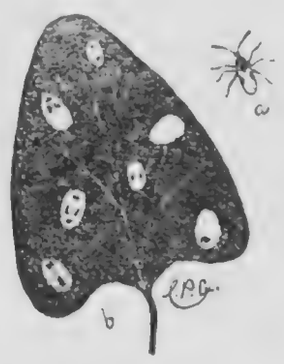


Fig. 28.

mation. When it is set to cut deep and three horses are used, it is as good as a gang plow.

4. As to changes in harrows I would suggest that the frame of the spring-tooth be so made that it would run higher from the ground, as I find those we now have are quite apt to clog.

Charlotte. W. H. H.

HARROWS FOR VIRGINIA.

Probably four-fifths of the harrows now in use in Southwestern Virginia are still the old-fashioned "A" or Double "A", with square iron teeth pointed at the end, driven through a tough oak frame. This is the case, not because our people are not alive to improvements, but because the newer implements are not adapted to the rough and broken surface of a large portion of the country. Besides, the latter are not so vastly more effective in

the work they do as is claimed for them by the manufacturers. There are quite a considerable number of Acmes in use, a few spring-tooth, and fewer still disk and Cutaway harrows. Some years ago the Thomas was considerably used for working over corn the first time and for putting in clover and grass seed on wheat. For these purposes it was a very effective implement; but for other work it was not particularly desirable. It has, however, of late been laid aside.

I have myself been using for several years a mounted spring-tooth harrow, for which strong claims were made when I bought it. Its work is not satisfactory; in fact, it works no better than the old "A," while it is far more difficult to clean when it becomes—as it does very readily—choked with vegetable matter, old straw or weeds which have been turned under. It pulls up sods even when run with the plow-furrows, and these stick in the teeth and are dragged along until they are pulled out by hand. The levers, one at each wheel and not in reach from the driver's seat, do not lift the frame high enough to admit of accumulations being dropped.

If I were confined to the use of a single implement, I would choose the Acme. For general purposes, it seems to have given more satisfaction than any other, but if I could have two harrows, I would take in addition a disk or Cutaway, preferably the latter. When it is practicable to use them, the disk and Cutaway are invaluable for chopping up an inverted sod or for preparing an oat or corn stubble for wheat without rebreaking. When followed by the Acme as a smoother and leveler, if the ground was plowed in proper condition, the work done is all that could be desired. If, however, the land is largely clay, and was broken when it was either too wet or too dry, and the clods have become hardened in the sun and wind, no harrow that was ever invented will ever put it in good conditon for a crop. Nor will the plank drag and the harrow combined pulverize the clods as one would desire. Any sort of an implement, on the other hand, will do good work when the land has been broken in proper condition and especially in spring after having been turned early enough to have been subjected to the action of frost. On account of their shape and construction none of the improved harrows can be used to advantage on steep or rough hill sides or in new ground where there are many stumps. With a wooden hoop across the broad end of an "A" harrow, it can be lifted on either side to pass over a stump or to clean it of trash, and that without stopping the team. An improvement on this form, I think, would be to have steel knives with curved cutting edges instead of perpendicular teeth pointed at the end.

Pulaski Co. H. L. WYSOR.

POINTED PULVERIZERS PAY.

If I could own but one harrow, the frame of that one would be made of hard wood, light and strong, and it would contain 72 round, sharp-pointed, hard steel teeth. Such a harrow is better adapted to general farm work than any spring, smoothing, rolling or cutting harrow now manufactured. If I could have two harrows I would add a disk. The manufacturers of the disk harrow have lately improved it by making the disks larger, which reduces friction and makes the harrows easier to draw and handle. Another improvement is the substitution of two levers for one, so that either side can be set forward or backward without changing the other. This is especially useful in making short turns, as it prevents the heaping up of earth where it is not wanted. The disk is especially useful on lumpy or soddy land, and there it does its best work. It enables the farmer to pulverize such land and reduce it to a proper condition for seeding more quickly and easily than could be done with any other implement or set of implements. I have seen fields of half-rotted, tough sod cut up, pulverized and put into first-rate condition in a very short time with a disk followed by a common harrow. Before the advent of the disk such land would ve been regarded as almost worthless for immediate cropping. I have also seen fields of stiff, clayey land which owing to being trampled by stock while wet, turned up as lumpy and cloddy as an old road, reduced and put in perfect order for seeding by the use of the disk alone. If the disk follows closely after the plow on such land, one harrowing will pulverize the soil more than half a dozen after the clods are baked dry.

On land that is wet enough to be sticky, however, the disk is a complete failure. When it first appeared many farmers conceived the idea that it would be an excellent implement for putting in oats among cornstalks in the early spring; but a trial soon taught them otherwise. The stalks and sticky soil together clog it up in short order and render it worse than useless. In this section the farmer feels quite easy about the preparation of his land for crops, so far as the harrowing is concerned, if he is the owner of a good 72-steel-tooth harrow and an improved disk.

When buying a common harrow, I would advise the farmer to get one that has a light, strong, hard-wood frame, plenty of long, sharp-pointed, hard steel, straight-up-and-down teeth, and then if he takes good care of it, housing it when not in use and repainting it occasionally, it will last him 20 to 30 years. In this section the disk harrow is used mainly for pulverizing soddy and cloddy land, and it does the work very well. Smoothing harrows are used by a number of farmers for harrowing corn land just before, or about the time the plants appear, and also for finishing off wheat land for the drill. I have not seen either Cutaways or spring-tooth harrows in operation here. The Acme has been used to some extent. FRED GRUNDY.

Christian Co., Ills.

WESTERN NEW YORK WISHES.

Forty years ago the 30-tooth harrow was the one in general use. A few years later the 40-tooth harrow was introduced, and a few years later the 48 and 56-tooth harrow was manufactured and sold in this section. It was called the chisel-tooth harrow and each section of it had four beams or scantlings, the 48-tooth had six teeth in a beam and the 56-tooth had seven. The teeth were made from bar-steel eight inches in length, half an inch in thickness and 1½ inch in width. Harrows of this kind were the best in existence till 1865, when the spring-tooth was first seen in this section. I sowed a field of cats broadcast, and commenced to harrow on one side of it with a 30-tooth and on the other side with a 56 chisel tooth harrow. The oats were sown on the furrow and the ground was harrowed once only. It commenced to rain and rained so for two weeks that I couldn't get on to the field again. Now for the results: where I used the 30-tooth you could see the furrows and the seed was only partially covered, and that section of the field did not yield more than 20 bushels to the acre, while the rest yielded 45 bushels per acre. Some of the farmers in this vicinity have been using the wheel harrows; but the dealers have stopped selling them, as they had to warrant them, and the farmers broke so many teeth that there wasn't any profit left for the dealer. The best general-purpose harrow w have now, is the Perry spring-tooth float, and if I could have only one, that would be the one. But some farmers sow grain yet broadcast, and I don't think the spring-tooth as good to cover grain as the 56-tooth, as it leaves the ground too rough, but most of our model farmers drill their grain now. Some of the farmers in fitting a heavy sod for corn or beans, use a disk harrow the first time, and then harrow once and sometimes twice with the spring-tooth, and if they plant the corn with hoes, they generally go over the last time with a smoothing harrow. I think if a farmer has a spring-tooth he can dispense with the disk harrow; but every farmer that farms from 75 to 100 acres should have at least three harrows—the spring-tooth, the chisel-tooth, and a Thomas smoothing.

Orleans Co., N. Y. J. P. C

INDIANA IMPLEMENTS.

I think that the spring-tooth harrow would be preferred if the farmer were confined to the use of only one harrow for all purposes; but the farmer who is so confined works or farms at a disadvantage. Suppose you are hurried to get your corn planted on sod ground and must harrow as soon as the plowing has been done, or harrow land by land as you are plowing, the Acme will do the work better than the spring-tooth, as it will pulverize the ground, press it down and smooth it without tearing up the sods and scattering them on top; but if the sod has been plowed some time and has become hard and settled, I think the spring-tooth would do better work than the Acme, or the common square-toothed harrow in preparing it for planting. I have an A-shaped harrow with small shovels about two inches wide made of steel, that I think fully as good as the spring-tooth to fine up ground that has become packed after plowing. After corn is planted and is to be harrowed before it is up, I would prefer the common square-toothed harrow to either the Acme or the spring-tooth.

We are not using the disk, or Cutaway harrows here to any great extent and I have had no experience with them. The disk is used some, and I have heard it praised as cutting up sod so that subsequent harrowing will not tear it up. I do not think a farmer should confine himself to the use of one harrow, and my experience has been that all the harrows I have used are not sufficient to put wheat ground in the best condition for seeding. When the clods are hard in the fall,—and on clay lands they are more or less so,—I have seen them pass through the square-toothed and Acme without sufficient breaking after several harrowings, and a roller would not by its mere weight crush them, but a roller pulverizer would. With the several harrows spoken of above and the pulverizer, I have no anxiety about getting the ground fine after I have it plowed.

As to improvements in harrows, if a harrow would not become too heavy to draw with a piece of railroad or other iron attached, it would in many cases double its efficiency; but probably on account of the draft it would be better to use such a drag separately. While I have no suggestions to make about the improvement of harrows, I have a suggestion to make about our two-horse corn cultivators. The experiment stations have demonstrated that a four-inch-wide tire will not draw as heavily in loose ground as a two-inch tire. I would suggest that some one of our manufacturers try a four-inch-wide tire on a two-horse corn cultivator and separate the shovels so that they should work separately. As they are now made, when you move a shovel to or from the row, you must move two, as they are so fastened together that you cannot move one without moving both. Separate them and let the one furthest from the corn work in the middle of the row without requiring any more attention than to set it to the right depth and then it will be very much easier to work the shovels that run next to the corn; and the labor of handling the plow will be lessened more than half, as it is the shovels furthest from the corn that run the deepest, and are for that reason harder to move to or from the corn, when one has to move to keep from plowing up the corn or to get the earth to it. With the shovels separated, it will be easier to make a better riding cultivator, as one shovel can be more easily handled with the foot than two. S. B. H.

HARROWS AT AN EXPERIMENT STATION.

Prof. J. W. Sanborn, last year, conducted an experiment to show the relative values of different harrows. He selected the Acme, a disk, a spring-tooth, a square-tooth, a smoothing harrow and the Lubin pulverizer, and tested them for draft, for depth of cultivation, for draft per inch and pound of soil stirred, and for pulverization of the soil.

An account of the tests made with these implements will be found in Bulletin No. 4 of the Missouri Agricultural College. It will be impossible for us to give all the details of this experiment. Those who wish to study them all should examine the bulletin. The following summary, made by Prof. Sanborn, will state the case briefly:

1. No one harrow is sufficient for the best tilth of a farm. 2. The harrow needed varies with soil and its condition. 3. Harrows, as substitutes for plows, do not save force. 4. Harrows till shallower than is supposed. 5. The bottom of the tilled area varies widely in regularity. 6. Wedge teeth and flat teeth with a front slant compress soil and are probably good for light soils. 7. Teeth lifting dirt to the rear loosen soils the best. 8 One harrow may break the clods best, but not leave as much fine soil as another. 6. Each harrow tried had a place to which it is best adapted, but for a general-purpose harrow on a heavy soil, depth of cut, looseness of soil, ease of draft, and pulverization, being considered the leading demands of a harrow, the disk, on the whole, proved the most satisfactory, although having the weakness of forming a bad bottom and of ridging the land.

Indust'l Societies.

NEW YORK STATE AGRICULTURAL SOCIETY.

THE ALBANY FARMERS' INSTITUTE.

Bordeaux Mixture a specific for potato rot; a recipe for it; excellent hints on the manufacture and sale of butter; the cheapest good ration for dairy cows; handling the milk and cream; swine, and swine breeding; enormous number of insects; their modes of reproduction; combating them; the process of digestion in the cow.

THE paper of Prof. C. H. Peck, upon the potato rot fungus, presented a new and seemingly very valuable remedy against the pest, which is certainly worthy of trial by every potato grower. It is known as the Bordeaux Mixture, and has proved by experiments in France to be an absolute preventive of the dread potato rot. The formula for the preparation of the mixture, is as follows:

"Dissolve four pounds of powdered sulphate of copper in 16 gallons of water; in another vessel slake four pounds of lime in six gallons of water. When the latter has cooled, it is slowly poured into the copper solution, care being taken to mix the fluids thoroughly by constant stirring. It is well to have this compound prepared some days before it is required for use. It should be well stirred before it is applied. This may be done with small brooms or wisps of slender twigs, which are dipped in the compound and then switched over the plants so as to thoroughly spray the leaves. This method is wasteful and tedious, however, and where one has a considerable area to cover it would be economy to procure a spraying pump. Make the first application when the plants are in bloom; the second a week or ten days later, and if the weather be such as will favor the development of the rot, a third and perhaps a fourth application should follow at about the same intervals. The object is to spread upon the foliage and stems minute quantities of the copper-sulphate and lime in advance of the advent of the fungus spores. Then when these do come this mixture destroys their vitality and prevents their germination and all its evil consequences. It is liable to be washed from the leaves by heavy rains, which makes it necessary to renew the treatment from time to time. It is a question whether or not the mixture may not prove fully as beneficial if a small quantity of London-purple be added to kill the second crop of potato bugs.

After a short but practical talk on farmers' gardens, by Dr. F. M. Hexamer, Hiram P. Hopkins, a young farmer of Erie County, gave his experience in the manufacture and sale of butter. He said that a cow in a badly ventilated barn, and eating poor food cannot produce first-class butter. A ration of 20 pounds of clover-hay, and six pounds of grain will cost 16 cents a day, and the manure will pay for the care. But if you feed 30 pounds of silage, five pounds of hay and five pounds of grain, the ration will cost only 11 cents per day, and this is the cheapest ration. It costs him $38 50 per year to keep his cows, that is, 1½ cent per quart of milk, or 11¼ cents per pound of butter. His cows make a pound of butter from 16 pounds of milk, and the butter averages, in the Buffalo market, 35 cents a pound the year through. Take the milk immediately from the cow to the dairy-house. If you do not, bad odors are absorbed, and he also finds that when shallow setting is used, 15 per cent. of cream is lost if the milk is left standing 15 minutes. He ripens the cream in deep vessels. Every time he churns unripened cream, he finds a loss. When the cream is a trifle acid it is considered sufficiently ripened. He prefers a concussion to a friction churn. When the butter comes he puts into the churn a gallon of water for a gallon of cream and a handful of salt. Then he draws off two-thirds of the butter-milk, adds as much water and more salt, etc., till the butter is washed. He thinks white specks are coagulated milk from bottom of cans. Wash them out. Sprinkle butter with one ounce of salt to one pound of butter. Turn the churn over a few times and let it stand half an hour; work the butter as little as possible, press it into small packages and send it to market. Butter at 35 cents per pound pays a farmer 4½ cents a quart for his milk. His 15 cows produced 4,650 pounds of butter, 100 gallons of cream and 500 quarts of milk last year, which sold for $1,742. The cost of keeping was $577.50, leaving $1,165 for profit. He keeps the thoroughbred Jerseys. [Shouldn't a "sinking fund" be laid aside to pay for the cows after their profitable usefulness in the dairy is over, deducting from their price what they may then bring for the shambles, before reckoning up the profits? How about interest on the investment in them, too? —EDS.] His grain ration consists of equal parts of corn-meal, bran, oat-meal, barley sprouts, and oil-meal. In the summer he soils his stock. He never pastures them. He is not rich enough to do that. He waters the cows twice a day after feeding. For soiling crops, he uses rye, oats, peas and corn.

The Hon. Edward Burnett, of Mass., occupied the time till the close of the afternoon session with a talk on swine and swine breeding. His main points were as follows: The pig which in the shortest length of time and with least food will make the most pork, is the best to breed for home market. Select good, clean-cut sows, with strong constitutions, and a rather coarse than fine boar. Too much pains cannot be taken in getting a boar. He prefers a finely bred Essex or Berkshire. The cross will retain the constitution and vigor of the dam and the appearance of the sire. No farmer can afford to raise thoroughbreds except to sell them for breeding, because too much capital is invested. Since he entered the business of raising hogs, eight years ago, the Boston market has changed its preference from a 700-pound hog to an eight to ten-months-old pig, weighing 200 or pounds. A dairy farmer wants a certain number of pigs. These can be raised most

profitably between March and December. At the end of that time the pig should weigh 150 to 250 pounds. "Dirty as a pig" is an old saying; but pigs prefer clean pens and food, though they will drink the foulest slops when forced to do so. They will repay one well for the care of their pens and warmth. He feeds crushed oats and oil-cake in place of bran. He begins to feed his pigs clover and green stuff as soon as they are weaned. Pigs that are soiled give the best results. Disease is largely caused by depriving our pigs of clean quarters and green food. He continues feeding clover to his pigs till fall. In September he begins feeding Indian corn. He can tell by the grain of the meat as soon as his knife touches it, whether a pig has been fed on distillery slops or on clover and grain. Hogs fattened on barley make beautiful meat, containing much gelatine, the taste resembling that of the jowl or cheek of the pig. Pigs should have plenty of pure water. Details in pig breeding are as important as in other sorts of business.

Dr. J. A. Lintner, State Entomologist, spoke on "Our Insect Enemies" and showed the true value of the study of entomology to the farmer. He said the despised worm is in many particulars more wonderfully constructed than our own bodies. The number of insects far exceeds that of all other classes of animals combined. There are no less than 25,000 species in the United States, and 335,000 species are known in the whole world; while Dr. Asa Fitch estimated that a single cherry tree ten feet high was infested by 12,000,000 plant lice. One-tenth of every crop grown is destroyed by insects. The methods of reproduction are most peculiar and varied. The larval stage is one of incessant feeding. One of the fleshy larvæ will in one day increase its own weight 200 times. There is a continual struggle between man and the insects. We do not fight the species but the individuals. We seek rather to control than destroy the insects and to prevent them from depriving us of our profits. Nearly all of our worst pests have been introduced from Europe, though their infesting parasites often fail to follow. Each year their ravages are becoming greater. Formerly no apple insects were known, now there are 223 species. Among the controlling agencies are clean culture and high cultivation; children should be taught to study the habits of insects so that they will distinguish between friends and foes and destroy the latter. Paris-green and the spraying pumps must supplement prayer or it will be of no avail.

The paper of John Gould on "Dairying Demanded by the Times" was thoroughly enjoyed by all, and will be printed in a later number of the RURAL. Pres. Adams, of Cornell University, Prof. A. J. Cook of Michigan Agricultural College, J. H. Hale, of Connecticut, and Prof. L. H. Bailey, of Cornell, also addressed the institute.

The meeting was closed by a short talk from State Dairy Commissioner Brown on "Dairying in New York." M. F. W

Miscellaneous.

CORRESPONDENTS' VIEWS.

MARKET NOTES.—In a recent tour among the commission houses and markets in this city, I noticed a few things that farmers would do well to think of. After the farmer or gardener has labored hard to grow a crop, he certainly ought to do his best to put it on the market in good shape. Failure to do this is what generally makes the difference between the high prices quoted in market reports and the low ones received by farmers. I noticed one lot of apples which were faced with wormy, knotty, inferior fruit, that should have been kept on the farm for stock feeding. Customers in search of nice fruit, looked at them, shook their heads, and passed on. It cost just as much for a barrel to put those inferior apples in; just as much per barrel for freight and cartage, and just as much for commission on that inferior fruit, as it would on first-class, nicely assorted and packed apples, while the price received was probably not half so much.

One customer wanted a barrel of extra-large turkeys. The commission merchant had two barrels of large and small, good, bad, and worse, all mixed. To get what he wanted, the purchaser must buy the whole lot, which he would not do, unless at a much lower price than was asked. One barrel of the large turkeys, packed alone, would have brought two-thirds, or three fourths as much as the two barrels mixed. It would have paid well to grade them.

I noted the generally poor appearance of the celery among the wholesale dealers. It was dirty, poorly bunched and trimmed, with a discouraged look generally. In Washington Market I noted some very fine, fresh, clean-looking. Upon investigation, I found that the retailer, (more shrewd than the grower), had some of the same kind of celery seen in the wholesale house, which he was washing, trimming, and bunching in nice shape, and he was disposing of it at a good profit.

In these days of close competition and small profits, when the mercantile classes have made a fine art of showing their goods to the best advantage, will it not pay the farmer to consider these things? I think it will.

A FARMER'S NOTES.

WEATHER.—We are having strange weather for this section of the country. The ground has been barely covered with snow once during the winter, and the mercury, has been down to zero but twice. The past year was a hard one for farmers generally. We had a good crop of hay, a fair crop of potatoes, and a poor crop of corn. There is considerable complaint that potatoes are rotting in the cellars, so that there is a good demand for them at 65 cents per bushel. Apples are plentiful and cheap.

POTATO SCAB.—I have seen a great deal in the RURAL in regard to scab on potatoes. Last spring I broke up a piece of high, dry ground, furrowed it, and put shovelfuls of barnyard manure about two feet apart, and dropped a whole Clark's No 1 potato the size of an egg on each manure heap. The season was very dry, and planting in this way brought the hills above the surface of the ground; but, contrary to general opinion, I had not a very large crop; but the tubers were as smooth and handsome as any I ever saw. I also planted some of the same kind in trenches, but as the weather was so dry I did not consider it a fair test. I think I shall like that plan very well.

WHY A FARMER?—Some time ago the RURAL, asked its readers why they engaged in farming—whether it was from choice or compulsion. For myself I can say that I live on a farm from choice. Until three years ago I was in a mechanical business in a large city. My health was not very good and so I bought a farm. have worked harder and made less money; but I would not go back to the city at all, and cannot understand why any one prefers the city to the country, and Mr. Terry's reasons for living in the country, will answer for me.

BLOAT IN CALVES.—About September 1, a fine Guernsey heifer calf came along, which I wanted to raise. I did not let her suck at all. She was very hearty and did nicely for four or five weeks, when she began to bloat. After drinking about a quart of milk, she would puff up and could not drink any more; but she kept moving around and did not chew at all. I was told to try salt, charcoal, etc., but she kept bloating and grew very thin. One night, after drinking about a quart, she bloated so badly that I thought she would die. Her manure was rather hard. I gave injections, but they were of no use. I expected to find her dead, but she seemed pretty well in the morning. I put five heaping tea-spoonfuls of Epsom salts in a little warm water and turned it down her throat, and began to give her about a quart of milk at a feed, and whole oats with some hay, and I kept increasing the ration, and now she eats a quart of dry oats and considerable hay every day, and is as smart and healthy as she can be. She did not bloat after giving her the salts. I looked over a number of volumes of farm papers which I had in the house, but could find no remedy for bloat in calves. R. N. H.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

MCLEAN, McLean Co., January 13.—The past has been a very favorable season for farmers in this section. Corn was extra good. Hay and oats were average crops, but oats were badly lodged. Potatoes enough to supply the home markets are not raised here. The deficiency is supplied from Dakota. A great many draft horses are raised here, which sell for from $150 to $250. I think the RURAL is the best farm paper I have ever seen. Success to it! A. R. T.

GURNEE, Lake Co., January 20.—The times are very close in this locality, although we have had an average crop year.

The crops last year were not up to the average. Corn, of which we do not raise enough for home consumption, was not as good as in former years, on account of drought, grubs and the wire-worms. Wheat, of which there is but little grown, was good. Potatoes gave an unusually large yield, the Rural Blush taking the lead Oats were good both in quantity and quality. The late fall and open winter have favored the farmer. More plowing has been done than for some time. We look for the RURAL as for one of the family.

W. D. W.

Montana.

COMO, Missoula Co., January 10.—As predicted last spring, the crops of 1888 were very light owing to scarcity of water for irrigating purposes. Many fields yielded no more than half as much as in '87. So far this year all the indications point to another unfavorable season, the snow-fall so far having been very light. Our soil is so productive that under very unfavorable conditions the yield is a wonderful encouragement to laziness and careless methods of farming. A neighbor seeded an acre of Bunch-grass sod to wheat last spring, irrigated it once, and last fall thrashed 52 bushels from it. Owing to pressure of work incident to opening a new farm, I allowed my potatoes and rutabagas to care for themselves last year. They were irrigated, but nothing else was done to them, and from one acre I dug 270 bushels of marketable tubers and 35 bushels of small ones; while from half an acre I took 255 bushels of rutabagas. Prices are, hay, $8.00 to $10 per ton; wheat, 50 to 60 cents; oats, one cent per pound; potatoes, three-quarters to one cent; butter, 35 to 40 cents; eggs, 30 to 35 cents. per dozen.

A. C.

New Hampshire.

MILFORD, Hillsborough Co., Jan. 21.—The weather here is very warm and pleasant. I plowed on January 1, and also the 3d. I have been to work on the land since then drawing out manure, blasting and getting out stones. We think there never was a winter when so much could be done on the land as at present. There is not much doing in the woods. A few winters like this would be a good thing for the forests, but in our section the trees grow about as fast as they can be cut down, and there are more woods than there were 25 years ago. Everything the farmer grows is very cheap. It no longer pays to keep oxen; for we cannot turn them for beef and get our money back, and sometimes we get discouraged with life on the farm, but I will not go back to the city, for we get a living here if we do not have so much money to handle, and it is much better for the children to remain here, and I just love farming and I am not as easily discouraged as some. I think when we get a good thing it is well enough to let the producer of it know that we appreciate it. Now this applies to the RURAL NEW-YORKER I think it far ahead of any other paper I ever saw, and I would not sell the old numbers of last year for $2; for with that splendid index it is invaluable. I wish that I could make our farmers appreciate it. Some of them think it is out of our latitude. I tell them that it is good for all latitudes, and that I don't want to farm without it. I know that money comes hard with many; but if they would take the RURAL and read it understandingly, they would more than get their money's worth every time and also get a paper that every member of the family could read—a clean paper, advertisements and all. P. C.

New York.

WEST SHELBY, Orleans Co., Jan. 25.—The weather is very warm and balmy like spring. Hay is selling at $15 per ton in the market. Apples are a drug in the market, though in quality they are the best we have had for years. Several thousand barrels are being held by farmers and dealers; they are worth from 75 cents to $1.00 per barrel now, and there is no demand at these figures. Farmers are plowing and trimming their orchards. Land has decreased about 20 per cent. in value in the last 10 years. There are plenty of vacant tenant houses. Labor is scarce and the laborer demands more for his work than the farmer can afford to pay. Several acres of Niagara grapes have been set in this vicinity, with a very poor prospect for the growers, as the Grape Company sold the grape-roots at a high figure, and the farmers paid the first cost of the plants down; and gave the company a lien on their vineyards for one-half of the crop, for a term of years, until the balance is paid. The Grape Company has made a fortune already; but time only can tell how the farmers will make it pay.

J. P. C.

Ohio.

EDINBURGH. Portage Co., Jan. 21—The season has been very wet since September; the roads are almost impassable. Rain and snow, freezing and thawing have been continuous nearly all winter.

Wheat on the ground looks more promising than it has for some years at this season. Corn good, but much of it is standing yet owing to the wet season. Oats good; hay about an average crop.

Wheat has been somewhat below an average in this part of the country. A. S. P.

PROFITABLE HARDY APPLES FOR EXPORT.

J M McA., Belton, Can.—Almost the entire profit in growing apples in this section is obtained by shipping them to the British markets. Buyers pay little regard to quality if the apples are of good size and appearance, and have good shipping qualities. With this consideration in view, which are the six most profitable varieties for export? They should be hardy enough to stand a temperature of 30 degrees below zero, and be named in the order of their merit.

ANSWERED BY DR. T. H. HOSKINS.

Six varieties of apples likely to be profitable orchard fruit, suitable for the colder parts of Ontario, and adapted to the English market, are not known, good shipping quality being included with firmness of flesh sufficient to prevent bruising in transit, and keeping qualities that allow the fruit to be held over a dull market. In the warmer parts of Ontario most of the apples grown for foreign shipment in Western New York and Michigan, such as Baldwins, Kings, Greenings and Russets, can be grown; but not where the winter temperature is as low as stated. The requirement of "good size," if it means large, or even medium size, excludes the Fameuse, which otherwise might suit, also the Shiawassee Beauty. Both of these would be hardy enough against the climate. The Fameuse is shipped to some extent from Montreal; but generally packed (choice specimens only) in patent packages like egg-boxes, to be sold at a fancy price. The Shiawassee is a Michigan seedling of Fameuse and much like it, though a little more oblate, and slightly more acid. It is more valuable than Fameuse because it spots less. Along with these, and a little larger may be placed the new Princess Louise, which is a fine fancy apple. It has not yet been much propagated, and trees are scarce. Among larger apples, the Winter St. Lawrence is pretty well thought of as an export apple in the Province of Quebec. It is a very good apple, much like the Fall St. Lawrence, but rather smaller, and a fairly good keeper. I have not found it very productive, but my trees are still young. Another very promising apple is McIntosh Red, because it is large, handsome and good, and is firm enough for distant shipment in barrels. It is of the Fameuse type, but much larger, and darker in color. Carefully handled in Northern New England, it keeps very well. In unfavorable localities it is liable to spot, but in many places it grows quite fair, and bears well. Finally, the Wealthy may be named as among the best—superior in being always fair. It is of good size, color and quality, and the tree is an early and very profuse bearer, and the fruit a pretty good shipper. Not one in this list is a long keeper, and they should all be got off on the steamers from Montreal before navigation closes in the fall, to insure their arriving at market in good order, and keeping long enough afterwards not to cause loss to buyers. Fameuse should go on even earlier: not later than early September. Among them all, Winter St. Lawrence is probably the safest as a keeper. The only real long keepers, adapted to a 30 deg.-below-zero climate, yet generally known, are Ben Davis and Scott's Winter; but the quality of both of these excludes them from the category of dessert apples. It is impossible to give the above list in the order of merit as requested, because merit depends upon more than a single quality. Size, color, flavor, firmness, fairness, and productiveness of tree, must all be considered, and no one has ever seen all the good points in a single sort.

FLOWERS FOR A WINDOW GARDEN; PROPAGATING BEGONIAS; GOOD LATE GRAPES; PARSNIPS; SHADE TREES.

S. H., Kock Hall, Md.—1. What are good flowers for a window garden? 2. How are begonias propagated? 3. What is a good hardy white grape? The Pocklington is weakly with me. What is a good late black grape? Name a red one also. 4. Why do my parsnips have many small roots instead of growing a single symmetrical root? 5. What is the best maple for shade? Should maples and other shade trees be manured now or in the spring?

ANS.—1. Begin in Octobor with carnations and chrysanthemums, and with these include in November bouvardias and lobster-claw cactus All enter December, and add callas, Paris daisies, stevias and Chinese primroses. To these in January add Chinese and white narcissus, Roman hyacinths, cyclamen and oxalis, and pass into February with petunias, fish geraniums, Begonia coccinea and B. manicata, freesias, cinerarias and tea roses. In March to many of these will be added a host of others, as tulips, "Dutch" hyacinths, daffodils and other narcissus, and dwarf deutzias and fuchsias, and in April hydrangeas in pots, mignonette in pots, large-flowering cactuses, calceolarias, show pelargoniums and many other seasonable flowers. In May it is more a question of emptying than filling the window, and we turn the plants out on the piazza to harden them off preparatory to resetting or planting them out, and in this way do the plants a good turn and give the good wife a chance to clean house. 2. All begonias can be raised from seeds. Species come true from seed, but varieties are variable. Rex and other large, fleshy-leaved begonias are usually raised from leaf-cuttings; B. insignis, B. fuchsioides and other branchy sorts from cuttings in the ordinary way, and tuberous begonias from seed. 3 Late red, Jefferson; black, Worden; white, Niagara and Victoria.

4. Land plowed shallow, a stiff subsoil, and fresh manure near the surface of the ground will cause short, rooty parsnips, salsify or other crops of that nature. But good, long, clean parsnips should be produced on land that had been well enriched for last year's crop and subsoiled but not freshly manured with barnyard manure for the parsnip crop, though a little artificial fertilizer instead, would be advisable. 5. The Sugar Maple; but the Norway Maple will give shade sooner. Shade trees should be manured preferably in fall, so that the rains and snows of winter may wash the nutriment down to the roots; but a manure dressing now or at any time will do them good. But don't manure a newly planted tree before it has "taken" to the soil and started to make good feeding roots.

CORN AND COOKED AND UNCOOKED CORN-MEAL AS HOG FEED.

J. M. C., Evansville, Ind.—About a year ago one of the Eastern agricultural colleges made some experiments in feeding corn and cooked corn meal to hogs. As nearly as I can remember, the results showed that a given amount of corn put one pound of meat on the hog in a certain time; whereas the same quantity of corn ground made 1¾ pound of meat, and the same amount of meal, when cooked, made 2¼ pounds of meat, all in the same time. Who can tell anything more on this subject?

ANSWERED BY PROF. W. H. JORDAN.

The inquirer cannot refer to the Maine experiment in feeding raw and cooked meal, as the results of that experiment, continued for nine years, were in favor of the raw meal. I give below a summary of the results for each year.

In 1870 scalded meal fed warm was to raw meal fed cold as									95.5 to 100
In 1871 value of cooked meal to raw meal as									74.8 to 100
" 1872	"	"	"	"	"	"	"	"	82. to 100
" 1873	"	"	"	"	"	"	"	"	91.6 to 100
" 1874	"	"	"	"	"	"	"	"	98.8 to 100
" 1875	"	"	"	"	"	"	"	"	72.3 to 100
" 1876	"	"	"	"	"	"	"	"	88.8 to 100
" 1877	"	"	"	"	"	"	"	"	64.2 to 100
" 1878	"	"	"	"	"	"	"	"	78.5 to 100

It seems to me that these results are conclusive. In regard to whole corn *vs.* corn meal, I can only refer to the results of our experiment on that point, which were published in the Maine Experiment Station report for 1886-7, where six pigs from the same litter were divided into two lots of three each, one lot being fed whole corn and the other the same weight of meal ground from the same corn, and the growth was almost exactly the same in the two cases. The experiment was repeated later, and the pigs fed on whole corn gained the most. The results of this latter experiment are not yet published. Take notice that the first experiment occupied 194 days and the latter about 90. In both instances the pigs were thrifty, and very uniform in size and quality. I am of the opinion that in the past much money and time have been wasted in grinding and cooking corn as food for hogs.

FEED FOR FATTENING STOCK; SEEDING TO GRASS.

W. C. M., Blackstone, Mass.—1. I am giving some three year-old steers, weighing between 1,100 and 1,200 pounds, one quart of cotton-seed-meal and five quarts corn-and-cob-meal (one-quarter oats, ground) twice a day, with good hay, rye fodder, and Hungarian Grass. I wish to fatten them. Am I feeding enough grain and a good proportion? 2. I sowed a two-acre plot last spring with rye and grass seed, but the latter caught in only a small part. Would it work to sow grass seed on the frozen ground in spring, or had I better harrow then and seed and roll?

ANSWERED BY HENRY STEWART.

1. This feeding is not sufficient to fatten animals of this weight as quickly as is profitable. The cotton-meal might easily be doubled; in fact in feeding beeves with the most profitable results it is desirable to give them all they will eat up clean; but not to overdo it lest they should get off their feed for a few days and fall off. Scarcely any bunch of beeves are found that will consume the same quantity of feed each. It would be doubtless advisable to add gradually to the cotton-seed meal above mentioned and watch each animal and fix the full ration at the quantity he will consume with good appetite. It should not be forgotten that flesh and fat contain 75 per cent of water, and consequently fattening animals should be well supplied with water of a moderate temperature, not less than 55 or 60 degrees. It hastens the fattening of stall-fed beasts to give sufficient meal stirred in the water to make a thin gruel of it. 2. It is quite possible that the failure of the grass seed was due to the want of sufficient fertility in the soil. If the land should be harrowed in the spring, with a light sloping-tooth harrow, and some fine manure could be harrowed in with the seed, no doubt a good stand might be secured. Poor soil is more often the cause of failure of grass seed than dry weather. The work should be done as early as possible,

KEEPING CARP IN A POND.

E S. A., Torrington, Conn.—I built a dam on a small stream to make a pond, covering about one eighth of an acre, of a good depth, for the purpose of supplying ice for home use. The overflow is eight feet long and four wide. At times there is a sheet of water eight feet wide and a foot deep or more; at other times a two-inch pipe would carry off all the water. The pond is stocked with carp. How can I fix the overflow so as to keep the fish in while letting the water out? The overflow is made of planks with an apron. I fear ice will clog up the passage and force the water over the banks.

ANS.—The difficulty may be met by making a double lining of the dam inside, as shown at Fig. 30, and fixing a half-inch wire gauze

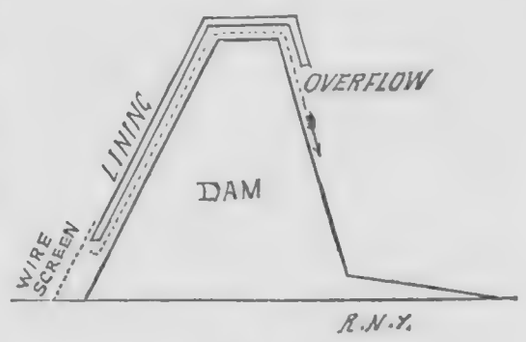

Fig. 30.

screen at the bottom to prevent the fish from coming up under the screen. The covering lining should be made with space enough to carry off the whole of the water, and if the water is carried over the face of the dam it will prevent the closing of the space by the formation of ice. If ice should form in very cold weather it should be cut away. The water in the pond would then never be up to the top of the inside plank lining, which need be made only over the waste gate. Carp will not move in the winter in your climate. They are snugly buried in the mud where they will keep warm, consequently no trouble need be borrowed about their escape in the winter. In the spring, and when there is no ice, you can put the half-inch screen on the top of the dam to keep the fish from going over.

CORN-AND-COB MEAL.

E. T. R., Swedesboro, N. J. Is cob-meal a good feed for "butter cows," say, six quarts thrice daily? Would the feed be improved if wheat-bran formed a part of that quantity?

ANS.—The cob of the corn acts as a dilutent of the corn-meal rather than as an additional nutriment. Six quarts of the corn-and-cob-meal are about equal in feeding value to 3½ quarts of clear meal, which, given alone, would be too heavy a feeding for some cows and would tend to bring on an attack of garget. The cob, however, will act in much the same manner as bran would do, but as bran is much more costly than the cobs, as a matter of ecomony, if not in every way, the cob-meal may be preferable to the bran.

HOG-DRESSED VEAL CALVES.

Several Subscribers.—What are "hog-dressed veal calves," and how are they dressed and shipped?

ANS.—The following extract from the circular of Messrs E. & O. Ward, of this city, will answer the question:

"Calves from three to six weeks old and weighing about 100 pounds, or, say, 80 to 120 pounds, are the most desirable size for shipment to this market, and should be dressed in the following manner: When all is ready for the killing, take the calf gently, (it must not be worried or chased, and should not be fed for a space of at least six hours previous.) Tie a rope to the hind legs, and hang it up clear of the ground or floor; then cut off the head just behind the ears; when thoroughly bled out, put in the gambrel stick, and cut off the legs at the knee-joint; then open the belly from just behind the kidneys to the breast-bone, then remove all the intestines, including the liver, lights and heart. If all this is well and properly done, the inside will present a clean appearance, free from blood or blood-stains. Now balance evenly on the gambrel, and place a stick of suitable length in the opening, to hold it in proper shape, then hang in a cool, dry place until the flesh is "set"—say from eight to twelve hours; it must hang until the animal heat is *all* out. The stick which was placed across the opening should now be removed, unless quite warm weather. Mark for shipment by sewing a "shipping tag" to the bag-skin, between the hind legs; it will then be ready for shipment."

BLOODY MILK FROM A HEIFER.

A. McM., Darlington, Pa.—My heifer, fresh for the first time ten days ago, has from the first given bloody milk. She was fed clover hay and one gallon of bran and corn chop, cob and all—one-third corn and two-thirds bran. A day before she came in, she refused the chop and could hardly get up. She is in good order; but her eyes seem bulged out. She eats hay and sometimes a few turnips, and apples; but she stands stupid. What shall I do for her?

ANSWERED BY DR. F. L. KILBORNE.

The blood in the milk will probably disappear in a few days. If the udder is swollen or hard, apply belladonna ointment and rub it well in. If the heifer is quite strong, give three-fourths of a pound of Epsom salts, and one ounce of ginger as a drench; and repeat in 16 hours if the bowels are not moved. Also give one ounce of nitrate of potash and 25 drops of tincture of aconite every four hours until the fever subsides. Then give two tablespoonfuls three times daily of the following powders: powdered gentian and ginger each one-half pound; powdered nux vomica, one-fourth of a pound; nitrate of potash one-half pound. If the heifer is quite weak, instead of the above, give two ounces of sweet spirits of niter and 25 drops of tincture of aconite three times daily, and four drams of carbonate of ammonia also three times daily, but alternating with the first. If the bowels are costive in this case give one quart of raw linseed oil, and follow this with warm soap-suds injections every hour until the bowels move freely.

THE ROLFE APPLE, ETC.,

J. M. M., Ont. Canada—1. Grape-growing here is very unsatisfactory on account of late spring and early fall frosts. I am thinking of growing a few of such native grapes as the Delaware, Niagara, and Concord under a cheap covering of glass. If the entire place were covered with glass, would it be too hot for the vines? Would it be better to have alternately a row of glass six inches wide and one of boards three or four inches wide? 2. What are the merits of the Rolfe apple?

ANS.—No, we should prefer all glass with suitable ventilation so that the heat could be regulated as desired. 2. The Rolfe is a rather new but promising apple, native of Abbott, Piscataquis Co., Maine. According to the Maine Pomological Society, it is a medium to large apple, shaded and striped with red on a yellowish ground. In form it is somewhat oblate (flattened) and angular. Stem short, cavity large, calyx closed, basin large and regular. Tree a good annual bearer. Flesh white, fine-grained, tender, sub-acid, core small. The tree is partly hardy, but not "iron-clad" in Northern Maine. The fruit can be kept into the winter, but is not a long keeper. Recommended as a promising market apple that succeeds farther north than the Gravenstein.

LAMENESS IN A COLT.

C. P., Howard, Dak.—My nine-months-old colt is lame in the right hind leg. I cannot locate the seat of the lameness. While running across a plowed field last fall, all at once she lifted the leg, going some distance on the other three, and she has been lame ever since. I've not been able to discover any fever, tenderness or swelling. She lets me handle the leg, bears her weight on it, and permits me to tap the bottom of the foot; but in trotting the movement is that of a hop as regards her hindquarters, and she doesn't step as far forward with the affected leg. What should be the treatment?

ANS.—Apply the following liniment over the hip-joint once daily, rubbing it well into the skin, and continue the application until the skin is well blistered. One ounce each of Castile soap and camphor dissolved in one pint of rectified spirit, add one-half pint each of strong aqua ammonia and sweet oil.

REGISTERING JERSEYS.

H. T., Erie, Pa.—How can I register the pure-bred Jersey calf I have just bought? I have his pedigree on both sides and it is first-class; but his sire has not been registered, as the owner keeps him for his own use. Will that fact disqualify my calf for registration?

ANS.—The sire of the calf must be registered before the calf itself can be considered eligible for registry in the books of the American Jersey Cattle Club. Write to F. W. Wicks, Secretary A. J. C. C., No. 1, Broadway, New York, who will supply instructions and blank forms for registration.

Miscellaneous.

J. B. C., Nashville, Tenn.—What does the RURAL know about the Pearl and Dutton Strawberries?

ANS.—The R. N.-Y. does not remember ever to have tried them.

H. J. P.—We do not sell the RURAL NEW-YORKER No. 2 potato. It is handled by J. M. Thorburn & Co., New York. The Hudson Bicycle cultivator is made by S. Terry Hudson, Riverhead, N. Y. The Newberry Potato Digger is not yet perfected, as we understand the matter.

C. W. G., Waynesboro, Pa.—1. What kind of stock is used for the Kilmarnock Willow? Would it be advisable to plant the Delaware Red Winter apple extensively? 2 Can the weeping maple be grafted on any other sorts?

ANS. 1. The Goat Willow—Salix caprea. 2. There are several Red Winter apples, but we do not know of the Delaware Red Winter. 3 We do not know of any weeping maple. Kindly tell us the specific name.

H. H. G., Nashville, Tenn.—1. Is there such a thing as a tree blackberry? 2. What does the RURAL think of the Earhart Raspberry?

ANS.—1. We made an effort to get specimens of the "tree blackberry" last year, but failed. The R. N.-Y., has mighty little faith in it. 2. The Earhart is the best ever-bearing blackcap we have ever tried. It bears fruit until after frost. With us, however, it seems to commit suicide by over-bearing and is short-lived.

R. H., Kingsville, Ohio.—How do the Red Polled cattle compare with Short-horns for beef, and are the cows good milkers?

ANS.—The Short-horn is considered the better breed for beef, while the Red Polled in this country is a better milker. In England, however, much more attention is given to milk production in the Short-horn than Americans give to this feature, and the Short-horn or its grades are more extensively used for milk production than any other sort.

E. C. C., Kane, Pa. 1. What are the names of some horse breeders in England? 2 Would it pay to import a single horse? 3. What is a good Shire stallion worth in England?

ANS. 1 James F. Crowther, Winfield, Yorkshire, England, and James Forshan, Carlton, Notts, England, are the largest breeders of English Shire horses. 2. No. We do not think it would pay to go to England for a single horse. 3 You can get one at all prices from $500 to $5,000 Why not patronize an American firm like Galbraith Bros., of Janesville, Wis.? They can, doubtless, show as fine a stock of horses as can be found anywhere.

C. A. M., Pierceville, Iowa.—In planting ten acres of corn, after getting the ground in good condition, I'm thinking of marking it out one way, and furrowing it out the other. I would put at intervals a forkful of manure and a handful of ashes, cover both with some earth, drop the corn and cover it. The ground has been under corn and oats for six years. It is rolling enough to let water run off it. It was broken in the fall. Would this kind of treatment pay?

ANS.—The R. N.-Y., can not advise such a course. We do not believe that corn on poor land ever pays when manured only in the hill. The young plants get a fine start, grow thriftily but fail afterwards. The roots extend three or four feet in every direction and when the grain begins to form they can not gather sufficient food for its growth and maturity. Better, put the ashes on top.

DISCUSSION.

ANOTHER WATER WITCH.

A FARMER'S DAUGHTER, LOGAN CO., KENTUCKY.—A correspondent of the RURAL wan's to know something about "witching' for water. "There seems to be just enough of mystery about it," he says, "to make it interesting, and enough of reality to make it worthy of study." That is what I have thought for a long time, and I have never neglected an opportunity for investigating the subject; still I must admit that it remains quite as great a mystery as ever. The method which he describes, however, as being used in Dakota, is entirely different from that practiced in Kentucky. Here our "water-witches" use a forked twig, broken off a few inches above the fork, leaving two long, slender prongs to be used as handles.

Several years ago, we needed a well on the outskirts of the farm to furnish water for a tenant's house, and employed an Irishman, named Pete Allen, to dig it. Having shown him the locality, we looked on with interest while he procured a divining-rod from a peach-tree near-by, for he was a "water-witch" as well as a well-digger, and went to work to discover the spot where the nearest underground stream approached the surface. He held the forked switch in both hands, with the palms turned inward, and the thumbs down, concealing the long ends of the supple twig, and in this position, he walked slowly across the place where it was desirable the well should be located. When he reached a certain spot, the upper extremity of the twig began to bend steadily downward, until finally its position was completely reversed, and the end that at first pointed toward the zenith, now pointed directly downward to a certain spot in the ground beneath. He walked over the ground several times with the same result, and then announced that he had found water, and a fine, bold stream at that. After prospecting around for some time longer, for the rod showed signs of great activity, Pete announced with a triumphant voice that at a certain spot, two streams, one from the southwest, and the other from the northwest, came together, and from that point there was only one stream leading off toward the east.

He also predicted that at the point of their conjunction, the limestone rock, in a fissure of which the water ran, was broken, making a vertical opening where the points of rock came together. "This being the case," he said, "the well will be an easy one to dig, and I am sure to reach water, and plenty of it too, at about 35 feet." [The "witches" or "diviners" who claim to be able to predict the depth below the surface at which water can be found, base their belief either on the force of the movement of the "rod" or on the diameter of the circle over which the movement is noticeable, one rule being that the depth is half the diameter of the circle; hence the deeper the water below the surface, the farther the influence it exerts.—EDS.] He showed his faith by his works, and at once began to dig.

Strange as it may seem, the two streams came together exactly as the "witch" predicted, except that he had to dig a few feet further to reach them, but when he did, the water poured in with such a rush that he was obliged to stop work and wait until a dry season, when the water was bailed out in tubs, the channel closed, and the well walled up from the bottom; after which the stream was again permitted to run in, and until this time the well has furnished an inexhaustible supply of excellent water. Whether the divining rod had anything to do with it, I do not pretend to say, but my experience goes to show that a well that is "set" by a water-finder, guided probably more by his own instincts than by the switch in his hands, is more apt to prove a success than when the spot is arbitrarily fixed by some one else. At any rate, that has been the case on our plantation, and as it is pretty large, there have been a good many wells dug on it first and last. So now we let people have their own way about it, for the same reason perhaps that we permit the old colored women to make soap "at the light of the moon"—because then their hearts are in their work, and they go about it in earnest. Still, in spite of all the wise ones say to the contrary, I can not help thinking there is something in the divining-rod not yet understood, for I have seen the switch move with my own eyes, and felt it with my own hands.

The "water-witches" were in great demand last summer. There was a severe drought in our section of Kentucky, the cisterns and wells were exhausted, and on our place water for the cattle became so scarce that two new wells were dug. The site of each was selected by a "witch," and good water was obtained in both instances at a reasonable depth. The divining-rod is selected from different kinds of trees in different localities; here any fruit-bearing tree is used though the peach, I believe, is rather preferred. The "witch" does not presume either to doubt his "gift," or to account for it: he simply accepts it. Neither does he appear to think there is any magic connected with it; most of them are men of little or no education except what they have learned from experience.

The divining-rod is still used in Europe for the detection of subterranean streams in times of drought, and the practice can be traced away back beyond the ken of historians; nor is its efficiency in finding water the only virtue attributed to it; for superstitious people have long employed it in ascertaining the position of silver, gold, and precious stones concealed in the earth. Mr. Fiske, the scientist, who has given the investigation of curious myths much of his attention, tells us that the divining-rod itself is but one among a large class of things to which popular belief has ascribed, along with other talismanic properties, the power of opening the ground or cleaving rocks, in order to reveal hidden treasures. In his learned way, he traces the origin of the curious superstition back to one of the many myths which owe their genesis to lightning, and claims that the forked streak of light is the archetype of the divining-rod in its oldest form. "Hence," he says, "the one thing essential to the divining-rod, from whatever tree it be chosen, is that it shall be forked."

MORE ABOUT LIME AS A "SOIL IMPROVER."

A. T. T., FRANKLIN PARK, N. J.—The article in a recent RURAL in relation to the benefits of using lime on some soils, is a matter of much interest to those who may have an opinion but who have not yet had much experience. The experience of the RURAL contributors covers a variety of soils, and therefore the reports given are all the more valuable. Lime has been extensively used in this vicinity for years, and many a farmer "points with pride" to his well cultivated and fertile fields, whose condition no amount of argument can convince him is not due to the free use of lime. The soils through this section are mainly of decomposed shale, in which limestone is an unknown quantity. They are red, and contain clay enough to render them sticky and tenacious to an unpleasant degree at certain seasons of the year. This red, porous rock lies within half a foot to four feet of the surface, and while all right during a season of abundant moisture, it is an unprofitable factor in a year of drought. Numbers of farms that were formerly overrun with wild blackberry vines and useless weeds, and which were either abandoned entirely or only farmed by starvation methods are now blooming evidences of the value of a new "sesame" that has unlocked the hidden fertility of the red fields and made them to blossom like a rose in the wilderness. Ask any of these farmers the cause of this change, and he will unhesitatingly answer—"lime." This radical improvement I am informed dates back for a period of perhaps 30 to 40 years. The staple business of these places has been that of furnishing hay for market. The yield has been good, and the Timothy offered for sale, commands the highest market price.

"How do you grow such crops?"

"I use lime"

"Nothing but lime?"

"Yes, I use all the manure I can make from the little stock I keep, and I sow lime liberally."

I mentioned this subject as a vexed question. With all this evidence of the value of lime about me, there would seem to be little doubt about the course to pursue in any contemplated treatment of my own ground. The trouble is this: for the past few years, perhaps five or six, the professional hay buyers—those with hay presses who buy as middle-men—insist that there has been a steady deterioration in the quality and a diminution in the quantity of the hay from these sections that formerly, or during the later periods mentioned, furnished such a valuable product. Lime is still plentifully used and the same quantity of manure is made and applied, but the result is not the same as formerly. The farmers themselves differ greatly in opinion as to the cause. Of course, the decreased revenue points unmistakably to some cause, whatever that may be. With these latter facts at hand, the use of lime to me is a vexed question. I have used lime at different times on different fields and in varying quantities. I have also used bone liberally. Now, why do I not in effect sow *lime* when I apply bone? Is not bone a phosphate of lime, and in applying bone, do I not also add to the application a quantity, and a useful one at that, of phosphoric acid, and in doing this am I not economizing in time, labor and cash All the advocates of lime admit the necessity of manure in conjunction with it, or if the *manure* pile is small, then they urge the use of some other form of fertilizer to supplement the shortage in manure. We usually sow 25 to 40 bushels of stone or unslaked lime per acre. This is first slaked with water and then spread broadcast either on sod for the following year's crop of corn, or on the corn crop shortly after planting. Its bulk is nearly doubled by slaking, so that 40 bushels become 80 bushels when applied. It is not easy or rapid work to haul and sow lime, neither is it inexpensive work. The price is about 13 cents per bushel of stone lime and it is admittedly necessary that manure or fertilizers must be used, therefore I do not see why I am not right and am not justified in expecting all the effects of lime in sowing either pure bone or a fertilizer whose base is largely bone, together with such manure as I may make from an understocked farm. What say others?

WHY NOT MAKE YOUR COWS PAY?

H. C. M., FAIRFIELD CO, CONN.—Prof. Roberts's statement in a late RURAL, that of the 1,534,000 milch cows in New York State seven-eighths are now dry, is true; 90 per cent. of the cows of this part of the country are so. How any dairy-man that can take a pencil and put two and two together can feed cows 150 days without any return is a mystery I am unable to explain; for I find it costs nearly as much to feed a dry cow as one in milk, to make her good for anything when she comes in; for what one saves in the meal-bin will be lost out of the hay-mow. I milk my cows nearly the year round. I cannot afford to let them run dry more than 40 to 60 days each, and every one must give a good flow of milk up to within 30 days of her time; otherwise she is too poor for me to own. I try to time my cows so that when one goes dry, I have a fresh one to take her place as nearly as possible.

Below is a statement of what my cows did in 1888. I do not expect them on a cold or stormy day to get shelter on the lee side of a stone wall, or to fill the pail from straw, cornstalks and hay too poor for market. I commenced 1888 with nine cows, some fresh and the rest two to nine months in milk; but all had calves some time in 1888. Through the year I bought a tenth cow, and I had her milk for two months in the latter end of her milking, and for two months when she came in fresh. I kept one calf with the dam until it was six weeks old, and sold it for veal, and a second until it was three weeks old. The rest were disposed of when seven days old; the cows also supplied all the milk, cream and butter consumed in a family of six persons, besides some milk and cream that were sold, yet I made 2,940 pounds of unsalted butter. Here are the figures:

Butter sold	$881.74
Milk "	9 35
Cream "	7.98
Calves "	22 40
	$921.47

BIG BUTTER BUSINESS.

G. W. H., ROCHESTER, MASS.—In answer to the RURAL'S inquiry regarding the number of pounds of milk required to make a pound of butter, here is my experience. I milk 12 grade Jersey cows. During 1888 the herd made 3,777 pounds of butter which was sold weekly to consumers at 35 cents per pound. Last week 177 pounds of milk made 11 pounds of butter, or about 16 pounds of milk for one pound of butter on an average of the whole herd. The milk from some of the cows would do much better, and I think that in a few years I can get from these a herd that will be a great improvement over what I now have. The plan to have cream weighed, will hardly work as it is raised under such various conditions. If raised by cold, deep setting, it will take more than two quarts for a pound of butter, whereas if it is raised in open pans or in the Ferguson creamer, and carefully skimmed, less than one quart will make a pound. I use the Ferguson Bureau Creamer and have used deep setting, and also the old method of open, shallow pans, and I am satisfied that about the same amount of butter can be made in all cases if the weather is favorable. Cream will rise no matter whether the milk is set three inches or three feet in depth, if the temperature is such that it will not sour in less than 36 hours. Still I think so well of the creamer that I would use it if I had to buy a new one every year.

SCOURS IN CALVES.

W. B. P., PRATTSBURG, N. Y.—Sometimes there will occur a case of obstinate scours among the calves either before or after weaning. The discharges may be light-colored, or dark and fetid. There will be dullness in the eyes and general wasting away. The best remedy I have ever found for this is from half-ounce to ounce bits of salt, fat pork according to age of calf, thickly sprinkled on both sides with ground, black pepper, and given twice a day as long as relished or until improvement is satisfactory. When I first decided to experiment with it in a case that had resisted various other kinds of treatment, I anticipated objections to the dose by the calf. To my surprise, after once getting the taste, the calf seemed to like it, and in the course of a day or two would stagger to me to seize the morsel from my extended fingers. In another case during the past season, after improvement was manifest, the calf would come from the opposite side of the field to me on seeing me with his medicine. The relish is lost when the difficulty is corrected. This remedy has been found adequate in every case in my experience. A slice of pork a half-inch thick is cut to proper sized pieces, covered all over with the pepper on a plate, and set within easy reach.

H. A. W., ERIE, PA.—I think the asparagus bed referred to in RURAL of Jan 19, must be of inferior quality and poorly managed, otherwise the family of four must be exceedingly fond of this delicacy. Several years ago I put out a bed 32 by eight feet, with two-year-old roots and the next season cut all we could use in a family of nine, and all were very fond of it. My only care of the bed was to cut the old stalks and apply a liberal amount of well rotted manure, the richer in nitrogen the better. Throw some loose boards or brush on the bed to hold the manure in place, leave the covering on until spring, then slightly fork the manure in, and so continue from year to year and I will warrant a family of four or 14 will get all they need.

What Others Say.

VALUE OF LITTLE THINGS.—Mr. J. H. Hale, of South Glastonbury, Conn, speaking in the Courant of the importance of "little things," instances a man who 15 years ago bought a farm in Connecticut for $8,000, paying down what cash he could and giving a mortgage of $4,500 for the balance. The general line of his farm operations has been the same as his neighbors', in addition to which he has been looking about the farm for brush to cut and stones to pick up, touching up the pastures with a little top-dressing here and there, gathering leaves in fall and muck in winter to add to his manure pile. With a good dairy, pigs and poultry, and a large fruit and vegetable garden, and with o her "little things" that can be picked up about the farm from time to time, he is marketing something in the village two or three days in the week all through the year, and thus always has cash to meet the daily expenses. A family of five have been well educated, the mortgage has been paid off, many improvements have been made on the place, and he is several thousand dollars ahead in money safely invested. His neighbors, who have only been able to just make a living, say that he spends too much time "fussing with little things," yet after all he has been "mighty lucky."

ANIMALS' PULSES.—In horses the pulse at rest beats 40 times, in an ox from 40 to 55, and in sheep and pigs about 70 to 80 beats per minute. So says Wallace's Monthly. It may be felt wherever a big artery crosses a bone. For instance, it is generally examined in the horse on the cord which crosses over the bone of the lower jaw in front of its curved position, or in the bony ridge above the eye, and in cattle over the middle of the first rib, and in sheep by placing the hand on the left side, where the beating of the heart may be felt. Any material variations of the pulse from the figures given above may be considered as a sign of disease. If rapid, hard and full, it is an indication of high fever or inflammation; if rapid, small and weak, low fever, loss of blood or weakness. If slow, the possibilities point to brain disease, and if irregular to heart trouble. This is one of the principal and sure tests of the health of an animal.

SAUNTERINGS.

IF you want the lowest-growing vines of any pea known to the R. N.-Y. buy the "Minimum" advertised in many catalogues. If you want a pea that will pay you for the planting and cultivation, buy some other variety .....

JAMES J. H. GREGORY says that the great mass of onion seed now sold in this country, is raised in California, and sometimes gives as good an onion as some strains of Eastern seed; but the onions do not always keep well.

MR GREGORY calls attention to the seed of the "New Queen onion," and also to the mammoth varieties. The seeds of these are

all, or about all, raised in Europe, and it is difficult to get seed of the "New Queen" that will vegetate much over 50 per cent., while those of some of the mammoth varieties are apt to fail in making well-formed, hard bulbs. It is better, as a rule, he says, to raise them from sets. In his experiment grounds, last season, where 46 varieties of onions were grown side by side, the great superiority of American varieties raised from home-grown seed was strikingly apparent.... .....

FORTY varieties of sorghum were grown at the Kansas Experiment Station. Those called Late Orange, New Orange, South Carolina Orange and Early Orange gave the highest per cent. of sugar.....

THE noted Russian writer Count Tolstoi, in his Sociology, as reviewed by the Christian Union, comes to the conclusion that for the evils of poverty the rich are responsible. They are responsible because they are evading God's law; "In the sweat of thy face shalt thou eat bread." The idle rich man violates this law, and makes other men provide bread for him. This is a curse to him, because it brings him and his children up in idleness; it is a curse to the poor, because it throws on them a double burden.....

THE Count says that the Russian preachers pretend to instruct in religion; but, in fact, they are wholly separated from the working classes, do not know their life, do not mingle with them, do not instruct them The scientific men are laboring with their intellects; but their labor is of small or no profit to the men who are battling with nature, and producing corn for lazy men to eat and wool for them to wear, and houses in which they may live.....

COUNT TOLSTOI'S remedy for all this is very simple. He would have us all become hand laborers. He would abolish the newly discovered and overpraised "division of labor;" he would have brain and brawn unite in the same worker. As the result, he would simplify life; return to natural conditions; scatter the denizens of the town in the country. Above all, he would have all brain workers recognize the fact that there is no possible way of serving society by mental labor without self-sacrifice.....

THE Editor of the Western Rural calls the attention of young readers upon the farm to the peace and safety they enjoy in what may sometimes seem to them a monotonous life. They are surrounded by no such temptations as abound in the city. They are living within their means and their conscience is clear. It is every one's duty to live within his income, and it is easier to do it on the farm than it is amidst the excitement and temptations of the city. ....

OUR respected London contemporary, the Live Stock Journal, does not believe that the "constitution," so to speak, of carefully bred, and suitably reared, domesticated animals *is* below that of their relatives in a condition of freedom. It no more believes the commonplace on this head, *i. e.*, about the unsound condition of our herds and flocks, than it does the conventional assurance of pedigree "Shorthorn cows which cannot give milk enough to rear their own calves".....

WHERE it is found (and in some cases it is found) that animals reared in a wild state survive hardships of winter or summer drought—when similar animals of domesticated origin succumb—the survival of the former is not really due to greater constitutional strength, but to intelligence more highly developed in certain directions. The bison survived the blizzard, while the ranch-cattle perished, not because it endured more cold or more privation, but because the bison retained certain traditional instincts—how to behave while the storm was raging, and how to seek food during the intervals .....

THIS inherited faculty the ranch-cattle never had; and this is what there is no means of communicating to them, the Live Stock Journal goes on to say. It is quite possible that an infusion of bison-blood *might* make the cattle in the Far West more clever at taking care of themselves in winter; but it is not in the least likely that a dash of wild blood (from any source), would make cattle and sheep more hardy for the purpose of meeting the difficulties of farm life .....

WEALTH, ancestry and brains are seldom combined in one person .....

DR WARD, a distinguished New Jersey fruit-grower, finds that the Minnewaski blackberry ripens with him as early as the Wilson. The plant is hardy and prolific, fruit large and sweet. Mr. J. H. Hale, the well known Connecticut fruit-grower, suggests, in the Hartfort Courant, that this blackberry being hardy in New England, is likely to prove to be the early sort for which they have been so long looking.....

THE AGRICULTURAL GAZETTE of London is authorized to state that Her Majesty, the Queen, has been pleased, as president of the Royal Agricultural Society, to express her intention of bestowing champion gold medals for the best stallions and the best mares exhibited in the horse classes, and for the best animals of each of the 15 breeds of cattle for which prizes will be offered at the Society's Jubilee exhibition to be held in Windsor Great Park next June In addition to the above, a gold medal will be given by Her Majesty to the first-prize winner in the champion butter-making competition to be held in the show-yard. These medals will raise the total value of the prizes offered in connection with this meeting to £12,000, or about $60,000.

A WRITER in the above journal, speaking of "chi led" p'ows, points out that notwithstanding the unblushing assertion of a certain Amer ican manufacturer, (the name is not given) instead of the invention having crossed the Atlantic from west to east, the passage was in the opposite direction .....

W. ATLEE BURPEE speaks very highly of the Red-caps. From four years' exper ence he recommends them as bo'h excellent, large and splendid table fowls. This breed has just been admitted to the Standard.. ...

PROF. COOKE (Vermont) believes that a dairyman should not be satisfied with anything less than 200 pounds of butter per cow per year, and that even that is too small. Don't have your standard at less than 200. In Vermont there are many dairies containing over 20 cows each that produce 300 pounds each per cow per year. If every dairyman in New Hampshire would weigh the milk of every cow he owns, both milkings, for a year, it would be found that one-third of the cows in the State were not worth keeping... .....

W. D. BAKER who, according to the Mirror and Farmer, received the first prize for butter from the N. H. Dairymen's Association, says that he believes in a cross of pure-blood Jersey and Holstein. The result will be rich milk and a good deal of it and an animal better adapted for the farms of New Hampshire than either of the pure-bloods.....

THE FARMERS' REVIEW says that the weighing system of live stock freight was put in operation January 3, by Kansas City roads. The rate to Chicago has been fixed at 27½ cents, and to St. Louis at 18¾ cents. Three sizes of cars have been recognized and a minimum weight fixed for each. For the small cars the smallest amount that can be shipped is 20,000 pounds: for the medium nothing less than 21,500 pounds, and for the cars 33 feet or more in length the minimum weight is fixed at 23,000 pounds. The Western roads have not yet fully fixed their rates, but will have the tariff prepared so as to follow the action of the other lines within a few days .....

LANDRETH & SONS record their protest against the name "Irish" potatoes, the plant being a native American found growing wild from Arizona to Chili.....

DAIRY WISDOM FROM AN INSTITUTE.—At one of the New York institutes it was said that silage or roots as aids to digestion were necessary to obtain the cheapest effective ration.

THE ration of Mary Anne of St. Lambert in her great butter test was given as 25 pounds of oats, six of oil-meal, 17 of pea-meal and two of bran. Fats in food all have to change in the animal to butter fats, etc. Many experiments were stated to have shown that the feed increased and decreased the yield of butter, according to the quality of the food.....

IT takes 3½ acres to keep a cow in New York State, and she gives 125 pounds of butter, on an average. With the silo one acre will keep a cow. One silo man now keeps 100 cows on the same ground on which he formly kept 25. The old way must go. Stowell's Evergreen Corn is best for silage. Cover with tarred paper, with little or no weighting. Silage if fed exclusively to milch cows will affect the milk. So will any other substance.

The cow giving most solids in her milk, and not the largest quantity, is the best. .. ..

HAIR and horn are made up of the same elements as milk, and the large t flow of milk is when the growth of hair is least. Breeds with large horns are small milkers, while small horns and fine hair are familiar characteristics of the noted butter breeds. Dehorning changes the disposition from cross or nervous to gentleness and quietness. The only function of the horn is as a weapon of defence.

ABSTRACTS.

—COLMAN'S RURAL WORLD: "Many newspapers are sent to men in the country whether they order them or not If these are taken out of the post-office from issue to issue, it is assumed by the publisher that the man getting them owes him therefor, and the law justifies him in exacting payment. "*This law affords opportunity for a most unscrupulous swindle and aids many publishers in the grand scheme of a circulation of hundreds of thousands.*"

—LONDON LIVE-STOCK JOURNAL: "It seems astonishing that well-bred British ponies do not command the attention of foreign buyers which they really ought to do. Some of the ladies of London society are the wives of wealthy Americans, and we all know that to have a beautiful matched pair of British ponies has always been the desire of society ladies in London."

—GARDEN AND FOREST: "The Revue Horticole records the fact that a nectarine tree at Montrouge, near Paris, bore the past season a crop of peaches, but no nectarines. This is not the first time that this has been observed, and it is not unusual to find an occasional peach among nectarines, a fact which seems to point pretty clearly to the varietal origin of this fruit."

—VERMONT CHRONICLE: "Nothing but his ruin, which is sure, will stop the career of a fast-horse fanatic."

—N. Y. TRIBUNE: "The sad fact is noted that while the cyclone often clears a man's land of house and barn, it has never been known to blow off the mortgage."

—A. W. CHEEVER: "The crying need of the Western farmer is more stock to consume his waste fodder. Beef raising pays something, but dairying, well managed, pays much better."

—LONDON AGRICULTURAL GAZETTE: "We can assure our readers that there is no more useful reading than honest narratives of successes won, unless it be equally honest descriptions of good intentions, which, for some cause or other have ended in at least temporary or apparent failure. There is an almost insatiable appetite for facts about farming."

—FARMERS' REVIEW: "There are dairymen who are now getting 40 cents per pound for butter and have plenty to sell; there are others who are getting but 20 cents and have very little to sell. The former have butter cows, fed with butter-making feed, the milk is set in deep cans in cold water, the cream ripened properly, tested with a thermometer before it is put into a revolving, dashless churn, the churn stopped when the butter granules are the size of No. 8 shot, the buttermilk drawn off and the butter washed and salted with brine, lightly worked, and exchanged for greenbacks at the rate of 2½ pounds of butter for a dollar greenback."

—"YOU will agree that it doesn't pay to handle a heavy hoe in the corn-field merely because it will be strong enough to grub with and has enough metal in it to sell for a few cents when worn out. But when you want to buy a butter cow you pursue a different course of reasoning; you hunt all over the country until you find a big, beefy animal, and you actually examine her beef points the first thing. If the beef points are all right you will buy her sure, as you, in your wisdom, look forward six or eight years to the day when you will sell her for old cow beef. And you carry the beef idea clear through your dairying, in your feed, in your treatment, in scant preparations for butter-making and in your rest during the winter. 'How do I know all this?' By the 20 cents you get for your pound of butter; by your saying that dairying doesn't pay; by your frantic efforts to raise a three-year-old steer, and then sell him for less than the cost, and by the fact that you are eternally sneering at 'fancy stock' and 'fancy farmers'"

Miscellaneous Advertising.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds, it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

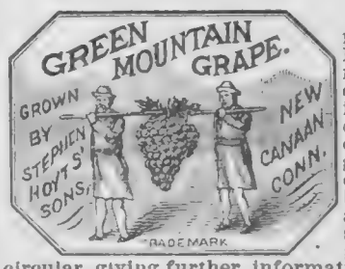
100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2¼-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

PEERLESS DYES Are the BEST. SOLD BY DRUGGISTS.

Trees, Seeds and Plants.



This grape originated in the Green Mountains of Vermont. It is very early; color, greenish white; pulp, tender, sweet and delicious. The only grape yet introduced that ranks **first**, both in earliness and quality. It should be in every garden. Send for circular, giving further information. We also offer a full assortment of other nursery stock. Address

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, FEBRUARY 9, 1889.

BUCEPHALUS Brown presents a poultry eye-opener this week.

"*How any dairyman that can take a pencil and put two and two together, can feed cows 150 days without any return, is a mystery I am unable to explain; for I find it costs nearly as much to feed a dry cow as one in milk, to make her good for anything when she comes in; for what one saves in the meal-bin will be lost out of the hay-mow.*"—H. C. M., page 90.

THE RURAL NEW-YORKER for 1889, will be, as hitherto, invariably, $2.00 a year for single subscriptions, and $1.50 in clubs of five or more.

NEXT week's R. N.-Y. will be, in part, given up to a consideration of commercial fertilizers. Should any of our readers desire that we send this number to any of their neighbors or friends, we shall be only too pleased to do it. Send in the names.

"*Lime is still plentifully used and the same quantity of manure is made and applied, but the result is not the same as formerly. The farmers themselves differ greatly in opinion as to the cause. Of course the decreased revenue points unmistakably to some cause, whatever that may be. With these latter facts at hand, the use of lime to me is a vexed question.*"—A. T. T., page 90.

IT is suggested to R. N.-Y. readers that they do not order their seeds or plants of any kind until the publication of the RURAL SPECIAL, which will be devoted in great part to a consideration of the best of the new and old varieties offered by seedsmen and nurserymen. The subject will be treated by specialists fully competent to treat it in a comprehensive way.

"*Now with all the poultry journals, the poultry departments, the constant pressure of sanguine people into the business for years, pray tell me why, among all lines of country profit-seeking, poultry is the one only line that cannot be overdone?*"—B. BROWN, page 86.

IT has been provided in the bill making appropriations for the Department of Agriculture, that henceforth the free distribution of seeds, about which there has been so much complaint, shall be transferred from Congressmen to the National Experiment Stations in the various States. This is a step in the right direction, which has been earnestly advocated by the RURAL.

"*The greatest improvement that could be devised for a harrow would be an attachment that would make it impossible to use it off the farm, and thus prevent its being worn out by borrowing neighbors.*"—JOHN GOULD, page 86.

MR. LAWSON VALENTINE writes as follows:

"I do not know when I was so well pleased with anything in a farm journal, as with the articles in this week's RURAL on "Help." In my opinion, that is one of the most important questions to discuss, if not the most important. I have said for years that I would buy, on speculation, as many farms as I could find captains to manage, and I say it this morning seriously. I am going to read every word of the articles on "Help," and that is something I have not done for years, with articles on any other subject."

"*The experiment stations have demonstrated that a four-inch-wide tire will not draw as heavily in loose ground as a two-inch tire. I would suggest that some one of our manufacturers try a four-inch wide tire on a two-horse corn cultivator and separate the shovels so that they should work separately.*"—S. B. H., page 87.

AT present the importation of nursery stock from Canada is free, and although similar importations from the United States into the Dominion are also nominally free, it is charged that the Canadian authorities have already thrown such restrictions about the business and propose such regulations that the American producer is discriminated against, and the advantages of a free exchange are not reciprocal. It is suggested as a remedy that a duty be placed on nursery stock imported from Canada. Representative Baker, who represents Monroe County, New York, in Congress, is now in communication with the nurserymen of the country with regard to this matter, and is preparing a brief to be submitted to the House Finance Committee advocating protection for our nurserymen against any unfriendly legislation by the Canadian Parliament. One-sided reciprocity is no more relished by nurserymen than by the rest of the community.

THAT is a very remarkable report just published by Mr. Henderson, Commissioner of Agriculture for Georgia. In it he shows that during last year the farmers of the State paid only at the rate of 78 per cent. per annum interest, against 108 per cent. in 1887, and this reduction he attributes to the efforts of the Farmers' Alliance. He shows that the average cash price of bacon in Georgia last year was 9.71 cents per pound; while the credit price was 12.3 cents. The cash price of corn was 77 cents per bushel; the credit price 98 cents. The average length of credit was four months. The advance in price is about 26 per cent. for one-third of a year, or 6.5 per month, or 78 per cent. per annum. A reduction from 108 to 78 per cent. in a single year is quite encouraging, still isn't 78 per cent. a trifle high even for the South? Ten per cent. would startle an average merchant, and 15 per cent. would start him on a quick road to bankruptcy; but he has no conscience in charging the poor farmer over five times that exorbitant rate. After all, wouldn't it be better to borrow money, even by mortgaging the farm, and pay cash for supplies?

SANITATION FOR THE COUNTRY.

IN 1596 Sir John Harrington, of London, England, published a pamphlet which, under the cover of a biting satire upon things in general, contained the plans for a crude water-closet. Up to that time the pamphlet was the best argument in favor of house sanitation that had appeared. The subject was handled in such a way that Queen Elizabeth forbade the author from appearing at court, but the evils at which he directed his sarcasm were so evident and crying that it may be said that his volume fairly started the discussion of sanitary methods. While this discussion has had to do mainly with the wastes of large cities, of late years considerable attention has been given to the condition of country houses. The great increase of suburban residences has added to this interest, and many farmers are considering the advisability of adding water-closet fixtures to their houses. There is one point in this connection that demands attention. The system of washing wastes out of the house by means of a stream of water, is the cleanest and most convenient method known. In most country houses the water supply can be readily obtained and stored in tanks. But the water system carries with it a dangerous risk. There is no condition more dangerous to health than an accumulation of such wastes in the vicinity of the house. Unless the drainage is so perfect that such wastes can be at once removed to a safe distance, the water closet is a disease trap. The success of such fixtures in the city, is due to the fact that a vast capital can be employed to conduct a complete system of sewerage, through which millions of gallons of water run daily. In not one location in 50 in the country, can we depend upon a perfect drainage for a water closet. In the great majority of places the common earth closet is the best arrangement that can be devised.

RAILROAD BOND-VOTING IN THE WEST.

PROBABLY the most remarkable of the extraordinary powers conferred by the Legislatures of various States upon municipal corporations, is the authority to aid in the construction of railroads by subscribing to their stock, issuing negotiable bonds to pay their subscriptions, and taxing the inhabitants or the property within their limits to pay the indebtedness thus incurred. It has been settled by a long line of legal decisions, including several by the United States Supreme Court, that Legislatures, unless restrained by the State constitutions, have power to confer this authority on municipalities. Many of the charters provide that the latter shall not contract debts beyond a certain percentage of their valuation, or that they shall do so only upon certain conditions, and in some States this object is secured by constitutional amendments. Under such circumstances those who contract with any municipality, do so at their peril; for if the percentage is exceeded, or the conditions have not been complied with, they must suffer the consequences. It has even been held by several of the States and by the Supreme Court of the United States that this rule is applicable to bona-fide holders of negotiable bonds issued for value received, even where the holders live in distant States or foreign countries, and have had no means of ascertaining when the constitutional or charter limit of indebtedness was reached, or whether conditions of a local character were unfulfilled.

The wisdom of aiding railroad construction in this way is more doubtful than its legality. The policy has been followed much more in the West than in any other section, and in the early settlement of the territory it was justified by the growth of the country and the rate of increase in property valuation, due to the transportation facilities afforded by such inducements to railroad construction. In several of the States, however, it seems certain that the policy has been carried too far. The indebtedness in the form of railroad bonds outweighs the benefits from the construction of so many lines. In some cases, no doubt, where roads were likely to be profitable, they would have been constructed even if aid had not been given; but in a majority of instances, they were built for the bonds rather than with a view to make them profitable as regular business enterprises. In his recent message Governor Martin, of Kansas, speaks very emphatically of the evils of this policy in his own State. In that and in many others, frauds, corruptions and abuses have followed the granting of this power. There has often been a wide-spread belief that flourishing cities might be created almost anywhere simply by building railroads; and there has been an "epidemic of insanity" in running hopelessly in debt for such purposes. This has led to the bankruptcy of hundreds and the serious crippling of thousands of towns and counties, as well as to shameless attempts at repudiation of honest debts, resulting in unmerited financial losses to thousands of investors and financial dishonor to hundreds of municipalities. Isn't it time to take Governor Martin's advice, and call a halt?

A MOVE AGAINST THE DRESSED MEAT MONOPOLY.

THE Beef Producers' and Butchers' National Association proposes to have introduced into all the State Legislatures this winter, a bill requiring that all animals producing meat for human consumption in any State must be inspected there before they are slaughtered. This is a move against the Chicago dressed beef monopoly. Governor Martin, of Kansas, has just recommended such legislation, and the Legislatures of several States, notably those of Pennsylvania, Ohio, Kansas and Colorado, are seriously considering it. The opponents of the measure claim that it is almost entirely in the interests of the butchers and stock-yard owners who have lost nearly all their trade because Western cattle, sheep and hogs are now, for the most part, slaughtered in Chicago and other Western points instead of being shipped "on the hoof" to give employment to stock-yards and shambles in other parts of the country. These are not the only parties aggrieved, however, for the monopoly is just as bitterly denounced by range and other Western cattle-men who claim that while keeping up the price of meat to the consumers, it unduly keeps down the price of live stock to the producers. Moreover, the vast supplies of meat it sends to all parts of the country greatly depress the prices of local meat stock, so that in wide sections it no longer pays to raise cattle for beef. Probably the most weighty objection to the proposed legislation is that the courts are not unlikely to declare it unconstitutional, on the ground that it would interfere with interstate commerce, on which Congress alone can constitutionally legislate. It bounds the home markets by State lines, which, it is claimed, is contrary to the spirit of our institutions.

The advocates of such legislation insist that many diseases which render meat unwholesome can be detected only by close inspection of the live animals which supply it; that a proper regard for the health of the people places such inspection within the police powers of each State; and that, therefore, legislation to that end is not in violation of the National Constitution, and they point to the acknowledged constitutionality of the oleomargarine laws of various States in support of their opinion. They further charge that it is a notorious fact that large numbers of animals unfit for human food are constantly sold and slaughtered at Chicago and the other great centers of the dressed meat and canning business, and that the deleterious flesh of these is shipped to markets in all parts of the country. The dressed-meat men deny that they have anything to do with this business. They point to the fact that the Chicago Board of Health keeps three inspectors at the stock-yards all the time, who have authority to kill all live stock intended for slaughter for human food and to send their carcasses to the rendering establishments, if they are found unfit for human consumption. They show that the Live Stock Commissioners of the State have established a thorough inspection of the yards; that the State of Illinois has also stationed at the yards an agent of the Humane Society whose business it is to look after maimed and "downed" animals which may be unloaded from the cars, and to see that no unfit cattle are sold for human food; and that after inspection has been made by all these public officers, the slaughterers have inspectors of their own who reject any diseased cattle which may, by any possibility, have run the gauntlet of the other inspectors. Moreover, they demand the appointment of inspectors by the National Government, "to make assurance doubly sure." It is a fact, however, that both the producers and consumers of meat throughout the country are bitterly dissatisfied with the action of the greedy meat monopoly of the "Big Four," and State and, perhaps, Federal legislation must ere long check its exactions.

BREVITIES.

The R. N.-Y.'s notices and reviews of seedsmen's catalogues received up to that date will appear next week.

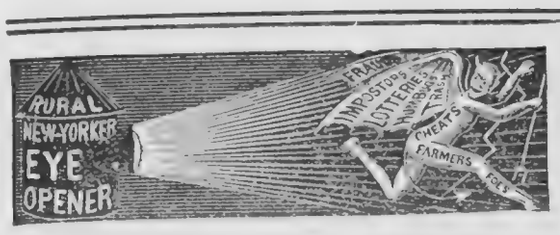
IT is with much regret that we learn that the large and finely equipped shops of the Moseley & Stoddard Manufacturing Company, at Poultney, Vermont, were burned on January 18. One ware-house filled with finished creameries and churns, was saved, so that for the present they can promptly fill all orders, and they have already made arrangements to continue manufacturing so that there will be no interruption in the business.

THE most thankless job on the farm—or anywhere else—is that of cleaning out the privy vault. We have done this job for the last time, we hope. We dug the vault out to a depth of five feet. It was then filled with stones and gravel. We shall never use the vault again. Large iron coal hods rest on the floor under the seats. A plentiful supply of coal ashes or sand will be kept constantly on hand in a box, to be used whenever required. A door at the back will enable us to remove the hods whenever it is necessary to empty them. We will have no more vaults.

OUR valued contributor E. S. Goff, of the New York Agricultural Station at Geneva, has been elected to take charge of the horticultural department of the Wisconsin Experiment Station, and also to fill the Chair of Horticulture in the University of Wisconsin, at Madison. While regretting that the New York Experiment Station is to lose the valuable services of Mr. Goff, we congratulate the University of Wisconsin on having secured them. Professor Goff is one of the most untiring and conscientious experimenters we know of.

THE bill creating a new Department of Agriculture has, for some time, been before conferees of both Houses, as they disagreed on some points. The conferees have just accepted the bill as it passed the Senate, and in a short time it will go to the President for his signature. It provides for the appointment of a Secretary of Agriculture who is to have a seat in the Cabinet, and an Assistant Secretary, who must be a practical farmer, together with other officers. The House wanted that the Weather Bureau of the Signal Service should be transferred to the new Department; but this has not been insisted on.

IN South Carolina there are two kinds of phosphate rock—river and land phosphate. In the European markets the former is preferred. In 1888, 190,274 tons of it were dredged from the beds of the rivers, and of this amount only 29,381 tons were retained in the United States. Of the land rock 259,330 tons were mined last year, and only 3,650 tons were exported. Though the soil of South Carolina is rather thin and sterile, her remarkable abundance of phosphate rock, besides rendering her own fields more productive, contribute materially to the fertilization of farm lands throughout the country. The State levies a tax of $1 a ton on the product, so that last year she obtained a revenue of $449,504 from this source.



THE BOHEMIAN OAT SWINDLE.

"I think that something about the Bohemian oat business has been published in some back number of the RURAL," writes a correspondent, "What is the character of the company?" The writer is evidently a new subscriber, otherwise he would know all about this swindle; for during the last seven or eight years, the Eye-Opener has vigorously denounced it and similar frauds at least two or three times a year, on an average. During that time upwards of a dozen "companies," with as many different names, have started in the Bohemian Oat "business" alone, in various parts of the country, and at least as many more in the Red Line Wheat and similar swindles. They flourished rankly in Pennsylvania, Ohio, Michigan, Indiana, Illinois, Iowa, and Missouri, and to a less harmful extent in Western New York, Wisconsin, Minnesota, and several other States, while the Ontario Grain & Land Company represented the swindle in Canada. A considerable number of really honest men were induced to take an interest in the various concerns at first by the plausible arguments of their promoters; but, as a rule, they were mere figure-heads, whose names among the directors, etc., were used to allay the suspicions of outsiders and to act as bait for gudgeons. The "agents" have always been the important factors in the swindles. Of late years, the fraudulent nature of the concerns has been so thoroughly exposed, and the losses they have inflicted on the public have been so outrageous, that no really honest man can nowadays lend his name to the frauds; though connected with them may still be found the names of some humbugs whose innate unscrupulous greed is hidden beneath a hypocritical garb of respectability.

The *modus operandi* of all the concerns was substantially the same. A circular glowingly set forth the extraordinary merits of the particular variety of grain handled by the company, while a list of its officers, often with bogus business ratings, bespoke confidence in the representations made and the promises offered. The agent, or a director acting as agent, sold the oats or wheat usually at $10 per bushel, though the figures varied from $5 to $15. Notes were taken in payment of the deot, and it was commonly agreed that they should not be transferred, and should be payable out of the proceeds of the crop from the grain sold. As an inducement to purchase, the company gave a bond to the purchaser, in which it agreed to sell for him the following year double the quantity he bought, and at the same price. As a rule, it was not difficult to sell on these terms, and hundreds of farmers, in various parts of the country, gave notes for $200 to $400 or more for the grain at, say, $10 a bushel. Sometimes the grain was sold only as a favor, on the ground that only a few could be selected in each neighborhood. Before the next harvest, the farmers' notes usually got into the hands of "innocent holders," to whom payment must be made. As a rule, the agent failed to call round at harvest time to sell double the quantity of grain as guaranteed, and in such cases the company's bond was always found to be worthless. To effect this a number of subterfuges were resorted to. In several cases, for instance, the company's constitution provided for an annual change of members, the old ones who had sold the grain going out at the end of the year, and the new ones—those who had bought it—taking their places, and assuming their responsibilities. Thus those who purchased the grain, *ipso facto* and without their knowledge, became, at the close of the year, the only members of the company and the only persons who were responsible to themselves for the performance of the promises the concern had made to them. In other cases, the contract or bond was so worded that the whole liability for damages came upon the agent, and he either disappeared, or was found to be entirely irresponsible, having no tangible property.

In some cases the agent appeared and sold the grain, on the same terms, to other farmers in the neighborhood, who were all the more easily gulled on witnessing the good fortune of those who had previously invested. The new buyers then became the losers next harvest, for it was very rarely indeed that the same game was played for three successive years in the same neighborhood. Frequently, however, the first purchasers really lost, even when their grain was sold for double what they had paid for it. In such cases, the agent nearly always retained 33⅓ per cent. for his share of the profits, and in many cases gave notes to the farmer for the balance, and, of course, these notes turned out to be worthless. Hundreds of thousands, yes, millions of dollars have been lost by farmers in various parts of the country by this swindle during the last eight or nine years. Ohio, Michigan and Iowa have passed stringent laws punishing all who may engage in such frauds by fine and imprisonment, and several of the other States either have already followed or are going to follow their example. All the reputable men who have figured prominently in connection with these swindles, have, without exception, lost in reputation what they gained in money. No man desirous of public confidence or of a reputation for common honesty should have any sort of connection with these concerns.

TO SEVERAL INQUIRERS.

The Eye-Opener has received several letters speaking in unfavorable terms of the Economy Shirt Company, of Pleasantville, N. Y. The gist of the complaints is that when money is forwarded to the concern, even in registered letters, the only acknowledgment returned is the official receipt for the money, and frequent letters to the "company" elicit neither the goods paid for nor any reason why they are not sent.....From all information the Eye-Opener can gather, the California & Southern Land Trust Company, of Red Bluff, California, and Cincinnati, Ohio, is one of those speculative land concerns with which no sensible man will have any dealings. The reputation of Southern California for such "enterprises" has of late years been fully as bad as that of Florida was a few years ago. No one should invest in land anywhere without having personally inspected it on the spot or got a trustworthy friend to do so..... The RURAL NEW-YORKER has refused to publish a lengthy advertisement for "The American Family" of this city. The concern advertises extensively that it will give away 50,000 genuine "solid gold" watches. Is it necessary to say any thing more about it, to induce sensible people to leave it severely alone? Even people who are not sensible may do so on learning that on visiting the address it gives in Fulton Street, this city, everybody there professed to know nothing about it .....The German Electric Belt Agency, of Brooklyn, New York, is one of those concerns which are better known at a distance than at what they claim to be their own homes. It is difficult, if not impossible, to find any one who will acknowledge he represents such concerns. The only address this "Agency" gives in its occasional advertisements in papers and frequent circulars through the mails, is a post-office box. Who ever heard of a reputable business concern giving a post-office box as its only business address? The only people who do so are those whose offices and ware-houses are in their hats; whose banks are distinguished by three gilded balls, and whose business is seldom properly stigmatized by those who fear the remote possibility of annoyance from a law-suit brought by people who never intend to prosecute it.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

A GOOD MANY of us will heartily indorse the remarks of our correspondent "Sweet Fern." Elaboration in serving is an impossibility where one woman has everything to do with the exception of such trifling aid as her children are able to give her. There should be a decent table cloth, if not a very fine one, and the table should be neatly set, for it is just as easy to put the dishes on in an orderly manner as to slam them on anyhow; further than this, a busy housewife cannot go. We like to see a growing plant or a bunch of flowers on the center of the table; but we never attempt this when setting for a lot of hungry men just in from work. It is rather apt to get in the way, and somehow it does not seem harmonious, though we have no doubt some clever writer could get up and prove that the rough men would not be so rough if they had the refining influence of flowers at meal-time.

* *

OF course, every woman would like fine and spotless table linen at each meal. But when one woman has to do everything for a household containing several working-men and a number of children, she cannot keep clean table-cloths without extravagant labor. In such case it is certainly advisable to use white oil-cloth for every day; it may be kept clean and neat, and is in every way preferable to soiled linen. Cleanliness is the first virtue of a good housewife, in our eyes.

* * *

THE "one small maid" is indeed an unattainable luxury in many country households; in fact as Mrs. Wager-Fisher noted, the lack of adequate help is one of the greatest trials a farm housekeeper suffers. In many country places it is impossible to get a woman even to do a half-day's washing; many a farmer's wife goes without help, not because she cannot or will not pay for it, but because it is impossible to find any such assistance. We personally know places within an hour's ride of New York, where there is only one woman who goes out by the day in each entire place, and she is apt to be excessively disobliging, because she knows her employers cannot get any one else.

* * *

THE childish treasures mentioned by our correspondent "B. H. G.," recall our own childish days, when we were encouraged to bring home any plant, flower, stone, moss, or wood, anything that would interest us, with the prospect of hearing all its history as soon as our mother found leisure. This leisure usually came on Sunday afternoon; after our regular religious instructions, we had a sort of object-lesson on anything we might have selected in this way. First, we were all asked to give our impressions of its appearance, which encouraged us to observe closely. We were told its uses, properties, etc., and as such discussions often called forth reference to foreign countries, we learned a good deal of geography, as soon as we were old enough to read for ourselves. We children would always hunt up in dictionaries and encyclopedias all the information possible relative to any subject we expected to discuss, the lesser ones being encouraged to ask all the questions they desired, not only relative to the object under discussion, but also concerning any other matter brought up during the talk. Our mother prepared for the subject as much as possible; when the matter was beyond her knowledge she hunted up authorities to give the needed information. A large amount of miscellaneous knowledge was thus obtained, relative to the science of common things, and we children always felt that our mother was interested in our treasures.

* * *

SEE how many things there are that children "want to know." Like James Watt, our first knowledge of the steam-engine was derived from the tea-kettle; one of our object lessons was on this subject. Then we learned something about insect wonders; about the caddis-worm, building his wonderful little house in the water; the beautiful dragon fly, which, before its gauzy wings came into being, was an ugly little water monster. We watched the tad-poles change from little tailed dots like commas, into portly and aldermanic frogs, and we were told all about frogs and toads, and all their relations. And no fairy tale could be more fascinating than the story of a lump of coal, from the time it was part of an old-world forest until it found a place in our coal-bin.

COUNT TEN.

"COUNT TEN, Tatty, count ten." These words came to my mind the other evening, but they were just too late to be of service. I knew quite well at the moment that I had spoken too hastily, and that in all probability I had been unjust, while if I had followed the rule given to "Tattycoram," and always counted ten before speaking when I felt irritated, poor little Bertie would have been saved a heartache, which I can never recall without a pang.

I had returned mentally and physically tired from a hard day's shopping for Christmas in the city. The tedious waiting at the ferry, and the over-heated and over-crowded cars had left me with a nervous headache, a trouble which I seldom plead guilty to, and to which I was trying not to succumb.

Bertie met me at the door with the cleanest of faces, with his bright curls so smoothly brushed, and with such an unusually subdued manner that but for my aching head I would have suspected mischief. There was none of the usual curiosity regarding my packages, but such a gentleness of demeanor that I stroked his sunny curls, and asked "How is mamma's little Lord Fauntleroy?"

"Please come in the parlor, I have something to show you," said Bertie, and following him there, I saw my favorite lamp shade, the costly gift of a friend, in fragments. "What a naughty, careless little boy!" I began, and without trusting myself to say another word I returned to the dining-room. A few moments later my husband, all unconscious of the tragedy, entered, made much of Bertie, asked him if he had been lonely, and if he was glad we were again at home. I saw the little chin quiver under his papa's caresses, and I began to appreciate something of how the little heart must be aching at the prospect of disclosure which he supposed would follow. Waiting until he had finished his supper, and gone into the sitting-room, I related the catastrophe. Without a word, my husband, in the brighest and cheeriest of voices, called Bertie to him, and taking him on his knee, praised him for having at once and unasked, told the truth about the accident, and in his gentle way drew from the broken-hearted child the story of how he "wanted to help Bridget" by beating the dust out of the parlor furniture, and of how he had "axindentally" hit the shade with the broom-handle; nor did his father let him relinquish his seat until smiles had chased away the grief from his poor little face. Had I lost my little boy that night, before I had had time to assure him of my full forgiveness, and to make him feel in some way that it was the headache, and not mamma that had spoken, I should never have forgiven myself. Bridget told me the next day, that after the accident he sat with folded hands, unable to play, or followed her from room to room to ask if she was quite sure that the four dollars from his bank would be enough to pay for it. "I was that sorry for him, mem," said the kind-hearted girl, "that I could have cried."

I have had my lesson, and I think I shall never again allow myself to speak even the slightest word of reproof until I have taken time to think. A wise man when asked his secret in educating his children, replied: "I have always found it desirable to be a little deaf, a little dumb, and a little blind." If you are given to hasty speeches, it is well to be a great deal dumb. PALMETTO.

A BIT OF A PROTEST.

NOW, please don't all of you put me down as a grumbler, for my feelings are not those of one. I have no doubt Palmetto is sincere in implying that meals should always be served in courses. "'Tis a consummation most devoutly to be wished," but how it is to be accomplished by any except a very few of your readers, is more than I can tell. Judging from the prevailing style followed by writers in agricultural papers, it might be supposed that nearly every farmer's wife had an abundance of help at her command: when it is a fact that even the proverbial "one small maid" that we hear so much about is almost unheard of. The other day I read in a farm journal that, as a useful present, the children might make a fire-screen for mother, to stand before the fire when she went to the kitchen to superintend the cooking!

I live in no uncivilized region, but where people have plenty of books and papers and many luxuries—some of their children enjoying a college education, but "really and truly" I know of only one or two farmers who keep a hired girl, unless in case of sickness. A very few hire their washing done and a few days' work a year. I have no reference to "gentlemen farmers'" but to "ye who till the stubborn soil and labor all day through." You don't see anything in all this about serving meals in courses and hired girls and "superintending the cooking?" When one woman does the work for from three to seven persons, keeps the house, bakes and cooks, washes and irons, makes the butter, takes care of the poultry, washes the dishes, and, in the odd minutes, mends and sews (and is a faithful mother many times beside,) how, in the name of common sense, is she to serve her meals and do many other things as she could, (and no doubt would,) if she had plenty of well-trained help at her command? Misused are these women, drudges, overworked illustrations of "the dark side of farming?" I think most of them would smile if they heard you say so. They would tell you that they work no harder in proportion to their strength than do their husbands.

I think I could suggest a method by which that well-bred gentleman who refused asparagus unless served alone, could tolerate it, viz: if he arose at four o'clock or soon after, did chores till breakfast was ready, got in the field as soon as it was light, and then worked till noon. I guess after such a course he could eat anything that was well prepared, especially with the prospect of going back to his work in an hour or less and continuing to toil till supper-time and then do chores till after dark. This steady hard work we farmers and farmers' wives enjoy is a glorious thing for an appetite.

Now, dear sisters, keep the house clean, prepare food in as acceptable a manner as possible; but remember this is only the foundation of a happy home, and all the rest depends greatly on you. It is a duty you owe to your family to be pleasing and interesting; how can you be so, if you are tired out body and mind, troubled with much serving?" I know that if one lives on a farm, there is much hard work; but with proper manage-

ment there is always some time for rest. Make the most of this and learn to do your needful work in the quickest and easiest manner.

"SWEET FERN."

CHILDREN'S TREASURES.

HOW little a thing will make children happy. Their treasures, though valueless to older, world-weary eyes, are as real to them, as our most precious possessions are to us. How carelessly we pick some dull common stone from the mantel and throw it out of-doors, with an impatient. "Oh, dear! Who put that there?" And presently one of the children will run to the mantel, and then we hear a wail of woe. "Who has thrown away my pretty stone I got out of the brook?" Sure enough, back to those long ago child hood days go our thoughts, when we too picked such pretty stones out of the brook, as we paddled bare-foot, listening to the gurgle, gurgle, of the waters as they ran in and out between the rugged banks.

I hope you all have a memory of just such a happy childhood as mine—of days when mother gave you a little lunch, perhaps it was only a slice or two of bread spread with good, sweet butter made by her own hands and you went with some favorite cousin or sister or brother to the grove where the brook ran noisily through among the trees, and sat on the soft green moss, and listened to the birds singing, and climbed the low-branched trees, and made swings of the hanging grape-vines, and came home tired and happy, laden with treasures, precious in your childish eyes. And if your mother was as sympathetic as mine, she rejoiced over them, and listened to all your little raptures, and romances over those squares of lovely green moss, perhaps two or three graceful ferns, a shell house of some defunct snail, a handful of stones or a curiously shaped stick. Oh! joyous childhood days! Though departed, still green and fresh in memory, who would not live them over again? If we cannot live them again, let us pay the tribute to their memory of giving to our own little ones just such days.

Mothers don't be over nice. If the boys' pockets run over with precious stones, let them have a box somewhere into which they can empty those pockets, even if it stands in a conspicuous place. It is better in my opinion to bend to a little disorder than to wound the childish feelings. My little seven-years-old son had a box all summer, just inside the door of my bed-room that opened off the dining-room. There was no less conspicuous place to keep it in, and although it jarred on my sense of order to see pieces of paper, strings, stones, buttons, nails, pieces of leather, etc., lying on the floor, thrown there by careless little hands, I picked them up, emptying the box from time to time of such articles as would not be missed. I kept a piece of carpet to throw over the box when I wanted the room to look very tidy. Such little indulgences will keep the little feet from forbidden paths. The boys will not want to keep bad company if home is pleasant and if their early training is pure. Presently when these little ones are done with "earth and earthly things," these little gems bathed in the water of life shall shine with an immortal radiance that shall never fade or grow dim. And in the house where there are many mansions they will be kept by the Father's hands, not thrown aside as worthless pebbles.

B. G. H.

SMOKING IN PUBLIC PLACES.

I AM writing in a smoking-car on a "limited" train on the Hudson River Railroad. The passenger coaches are crowded and I was compelled either to stand or go into the "smoker." I am not quite certain that I have by coming into the smoker chosen the lesser of two evils. The point I wish to bring out is this: why should a whole car needed for regular passengers, ladies and children, be set apart to accommodate, say, a dozen men whose filthy habits cannot be tolerated by the other passengers? What is true of trains is true also of other public conveyances. The "gentlemen's" (?) cabin on our local ferryboats occupies one half of the boat and is seldom if ever half filled, while the ladies' cabin is crowded to repletion. During the busy hours of travel, ladies and gentlemen are compelled to stand while the smokers have one-half of the boat to themselves with plenty of room and a choice of seats. There is, however, something providential in this, for they would suffocate in the foul air of the smokers' cabin if they were crowded in as they are on the ladies' side. Perhaps, properly considered, the enforced separation of men from their fellows may be like imprisonment, a sort of punishment for their filthy habits, but very few smokers look at it in this light. It is an ethical principle that no man has the right to do things which interfere with the happiness and comfort of his neighbors, yet that is precisely what those who smoke in public do.

How common it is to see a husband and father leave his wife and children in the ordinary coach while he goes into the smoker for a "quiet smoke." After a time he comes back polluted with the foul odors of the "weed" and makes his family and neighboring travelers miserable for the rest of the journey. If men must smoke, their isolation should be complete and they should not be permitted to offend others with the disgusting effluvia resulting from their detestable habit. The time is coming and I hope is not far distant, when the notice occasionally seen in public places will be the rule everywhere: "*Gentlemen will not smoke here, others will not be allowed to do so.*"

GOLDEN GRAINS.

THE UNITED PRESBYTERIAN says an honest life is always the best one. Many men who would scorn to defraud even to a farthing's worth are dishonest towards themselves, and live in perpetual treachery to their consciences.... .....

LYTTON says that anger ventilated often hurries toward forgiveness; anger concealed often hardens toward revenge.....

YOU must work, says Goldsmith; nothing is to be got for nothing, and no man who chooses to be industrious need be under obligations to another, for labor of every kind commands its reward.....

INGELOW says there is nothing so sweet as duty, and all the best pleasures of life come in the wake of duties done.....

OUIDA says that where we love much we always forgive, because we ourselves are nothing, and what we love is all.....

NOTHING is so flattering to the feelings of a man as the exhaustless and quenchless regard of a sensible woman, and no incense so rich can be offered upon the shrine of a woman's ambition as the avowed and enthusiastic affection of a man of genius .....

ONE day a little girl about five years old heard a preacher praying most lustily, until the roof fairly rang with the strength of the supplications. Turning to her mother and beckoning the maternal ear down to a speaking place, she whispered: "Mamma, don't you think that if he lived nearer God he wouldn't have to talk so loud?".....

IN Norwood, Beecher says that fretting is a perpetual confession of weakness. It says, "I want to and can't." Fretting is like a little dog pawing and whining at a door because he can't get in ....

TALMAGE doesn't quote much, and yet he believes in it. He advises writers to quote from all directions. It is a compliment to have breadth of reading so as to be able to quote. But be sure to announce it as a quotation. Ah! how many are making a mistake in this thing; it is a mistake that a man cannot afford to make. "Four commas upside down—two at the beginning of a paragraph, two at the close of the paragraph—will save many a man's integrity and usefulness."....

A STORY is told of an old preacher who applied at a farm-house for lodging. The sharp old lady who came to the door refused to take him in. He asked her if she knew what the Bible said "Be not forgetful to entertain strangers, for thereby some have entertained angels unawares."

"You needn't quote Bible," said the old lady quickly; "no angel would come down from heaven with a quid of tobacco in his mouth as you have." The door was shut and the preacher unhitched his horse and rode away in the rain.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

NOW IS THE TIME.

AS I was waiting for a car at the corner of a street some time since, I heard the following dialogue between an old man and a lad. The lad, shabby and dusty, with his hands poked far down into the depths of his pockets, stood kicking the curbstone with the toe of his well-worn boot as the old man approached.

"Hey, lad," said the latter, "what ar't doing 'ere? Thee hads't better be to work than standin' sunnin' theesel'; don't thee think so?"

"Ain't got no work to do," growled the lad. "Times is dreffful hard."

"Does thee expect the work to come along and find thee?" asked the old man.

"Naw," replied the boy, giving the curb a harder kick than usual, "but 'tain't no use lookin': I've looked everywhere, but there ain't no use—they ain't no room fer boys any more; might jest as well loaf as not."

"How old be ye?" asked the old man.

"Fifteen," replied the lad.

"Fifteen!" said the old man slowly "and givin' up a'ready, where does thee expect ter end?"

"Don't know, an' don't care much; what's the use anyhow?"

The old man began to give the lad some good advice; but as my car was coming, I did not hear exactly what he said; only I did hear him telling the boy how he regretted wasting his boyhood. This set me thinking, and these old familiar lines crossed my mind as I moved along—

"Never mind the crowd, lad,
Or fancy your life won't tell;
The work is a work for a' that,
To him who doeth it well.

"Fancy the world a hill, lad,
Look where the millions stop;
You'll find the crowd at the base, lad;
There's always room at the top."

Yes, there is always room at the top; but how many of us get there! If we waste our early hours of youth, if we let the morning of life go by without an effort, without doing our very best, we may be sure that, we'll never stand on the highest point of the hill-top. So many of us want to do something great and noble: want to be a success in life; but, while dreaming and longing for the crowning time to come, we are letting the golden hours of the present glide by unheeded. Like Wilkins Micawber, many of us are 'waiting for something to turn up;" but, nine times out of 10, it never will turn up, unless we go to work and turn it up. *Now—the present time*—is all we are sure of. There may be no future for us, so let each of us do our very level best to-day. Then, when all the "to-days" of our life are summed up together, we will find we have done our best always.

To be sure all this is more easily said than done: that I know by sad experience, but, if we made a mistake yesterday, or make one to-day, we should be sorry for it of course, and try to remedy it if possible, but we should not think that because of it, we must give up. Each should just say to himself, "I'll never do that again," and each day be sure that he does not

Sometimes the tasks awaiting us seem so many that they overwhelm us. It seems as if we could not do them all; well, we cannot—all at once. Take one at a time, beginning with what seems to you to be the most important; do it to the best of your ability; then go on to the next. A dozen things *half* done won't pay. Better do what you do *right*, rather than rush from one thing to another and have a lot of unfinished things on your hands.

There! What a sermon I've preached! But I *do* wish I could impress on the boys and girls what an important thing it is to do our best *always*. Have I done it? Oh, no! That is why I am so anxious to have you begin. I've begun, too. Maybe my best won't be as good as your best, but, if it *is* my best, it is all that I can do.

The New Year is young yet, and I hope each boy and girl (as well as men and women) will see if they cannot make a better showing when 1890 dawns, than they did with the opening of 1889. DORA HARVEY VROOMAN.

HOME-KEEPERS.

SINCE J. H. G. has such really sound views on home-life for women as far as he goes, and has so evidently studied his subject up to a certain point, it seems a pity that he should not go further, and give helpful hints as to the solution of this problem that confronts: the "proper" support of the "women folks," of whom there is a great preponderance. Of the causes that produce this result we'll say nothing—we will leave that to the medical scientists—but we'll speak only of the facts as we find them. That can, perhaps, best be done by referring to life histories about us. Here is one:

Years ago there was a family consisting of father, mother and three grown daughters, well-to do, fairly intelligent, reasonably healthy. The daughters were carefully trained in housewifely duties; but taught also that it was not proper for women to know much of anything else, except a mere smattering of *accomplishments*, so called. Only one matrimonial offer presented itself; that was from the last son of a dissipated father, but was eagerly accepted by the youngest and prettiest of the trio, for "mustn't she have a home of her own, and a husband to support her? And maybe she'd never get another chance." A few years later the father made some unwise investments, lost most of his property, and died. The brother-in law who according to the legends, should have been a tower of strength to this helpless family, proved but a broken reed intent only on getting possession of the scanty portion left for his wife. This he soon spent, then left her to support herself and three children as best she could. Her knowledge of anything but a housewife's duties was too superficial to enable her to earn a living. No family would employ a housekeeper who brought three children with her, nor would the wages paid secure board and clothing for them. Nothing was left but an orphan asylum for them, and kitchen service for her, delicately reared though she was, or starvation; for hunger knows no sex, nor is death a respecter of persons. Perhaps one thinks her mother and sisters might have aided her, but as they knew nothing of "business"—that "would be so unfeminine, you know"—the small property left for them mostly disappeared as agents' and lawyer's fees Later, one of the sisters inveigled an elderly widower into the noose matrimonial, and entered his home already occupied by two "home-keepers," a widowed sister, and an unmarried daughter, for whose support the ex-widower's salary was sadly inadequate. The mother and remaining daughter still live in a tiny house on one corner of their original estate, subsisting partly by doing plain sewing, and partly by the charity of their neighbors; nor do they think, even, of doing such man's work as bee-keeping, poultry-raising, or vegetable growing, though there is with their house, a bit of land well adapted to such purposes, and they would be healthier and happier in out-door work.

This is a forcible illustration of J. H. G.'s method of training women to be "home-keepers," as I understand it. Surely these women did not "compete with men in their occupations, and so lessen their wages, and the demand for services."

Now here is another picture: Two friends—teachers—have been house-keeping together in a modest way for years. Both are "spinsters of uncertain summers"—one of necessity, as she frankly admits than no man ever proposed marriage to her—the other from choice, she having turned away two suitors with the curt remark that she "knew that neither health, nor her temper would bear the strain of domestic life of to-day."

These women, thinking as does J. H. G., that "there are too many unkempt children in our streets for the safety of the nation," propose to do their part toward the betterment of things by adopting a couple of waifs, a brother and sister, clothing, and educating them, and giving them such home training as is possible under the circumstances. Before this time, they, being thrifty women, and very economical, had "put by a bit for a rainy day," though of course their salaries were much less than those of their brother teachers beside whom they worked daily. So far the experiment of combining housekeeping, school-teaching, and bringing up children seems to work well. The children are vastly improved both in manners and morals, and seem in a fair way to become respectable citizens. The boy has a taste for drawing, which is encouraged, as, if he has talent enough, 'twill make his living by and by. The girl has a fondness for whittling and for driving nails, and that is also encouraged, for, say these guardians, "women must eat, drink, and be clothed as well as men. Our girl may find that ultimatum of human happiness, a happy, prosperous home and may not; but equipped with so good a bread-winning trade as a wood-worker's, she is ready for emergencies in either single or double life." In one respect these children are trained just alike, for these self-appointed protectors believe in men's rights, as well as women's rights. Both are taught to keep their rooms tidy, to sew on their own missing buttons, to sweep and dust, and otherwise help in doing the housekeeping that is all done out of school-hours. That boy, at last, will not need to say, as Horace Greeley is credited with saying, that if Mormonism, including a plurality of wives, ever became fashionable in the East, a man should certainly have one wife on purpose to sew on buttons

If we believe in a Creator, we can't, of course, think there are any "superfluous

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

women." Whether or no "marriage is a failure," a large number of women in this Empire State, alone, can never enter the married state, for the very simple reason that there are not partners enough to go round. [Of the 5,082,871 people in the State in 1880, according to the last census, 2,505,322 were males, and 2,577,549 females, so that there was a preponderance of 72,227 of the latter. There has been an increase since in the number of both sexes; but the proportion has remained almost the same.—EDS.] Of the fitness or unfitness of many of both sexes to enter this latter state, this chronicler saith nothing, leaving that to the moralists and reformers on various subjects. The only question herein considered is the bread and-butter question. The average man's salary will not support the quota of women who, as sisters, sisters-in law, maiden aunts, etc., will be dependent on him, if all are "home-keepers" only, though Miss Alcott did say that "it takes three women to get every man into, through and out of this world." Congress would surely have to make appropriations to maintain many of these seminaries of "home keepers;" for house rent, fuel, and lights, food and raiment, church dues and society's demands for a houseful of adults, cannot be met by just making home pleasant, however important for the good of the country that work may be. The extreme pleasantness of any home may be questioned, perhaps, in which from three to six "home keepers" make it their sole business to tinker at the household machinery. It would be as if as many engineers of the masculine gender were trying to run one rail-road engine; one would open the valves to go faster; another close them to slacken speed, the third would want to stop at every station, the fourth wouldn't want to stop at all. etc, etc., and none of them would earn "board wages."

"POSTSCRIPT."

THE CHILDREN OF THE FARM.

THE frequent repetition of the question "Why do the boys leave the farm?" goes to prove that it has not been satisfactorily answered. Perhaps no two boys leave their old life for exactly the same reason. Still there are some general principles at work to that end, the correction of not a few of which depends on the farmer himself. Quite frequently the evil influences of forces far beyond his reach may be kept out of his own circle. He cannot control or banish the speculative epoch through which the world just now is passing, but he can take up the attention of his sons and daughters with healthier interests. But he so often feels that his power is so small beside this mighty enemy that it is not worth while to try the contest. He is discouraged just, perhaps, as you, dear readers, are at this moment. But you must conquer that weakness. Don't think about your strength, but about the object you are trying for. Is that small? You must depend upon yourself, and the sooner you wake up to this, the better. Take the children in hand and teach them to love the world around them. Nature is the best corrective for such unnatural development as dreams of "idle splendor" in her creatures, and where is Nature stronger than on a farm? Here on the start you have a powerful ally.

Hardly less in power, if rightly utilized, is the cabinet collector's epoch. With some encouragement and help, the young children may be led to gather seeds; to study and label them, taking them not only from the grains bins but from the weeds as well. Indeed such study among the older members of the farmer's family might often prevent the ignorant sowing or scattering of some noxious weed. Then let them take the different kinds of forest wood, the bark, the leaves, the flowers, and fruit and study well the use and properties of each. Then let them try the stones and various kinds of soil. There is no place where so great a variety of studies can be applied as on the farm. Chemistry, geology, botany, philosophy (at least mechanics,) and many other sciences and arts come into almost daily use with the farmer prepared to use them.

As the children grow, share the responsibilities as well as the labors of the place with them. Give each one something of the common product for which to be responsible, and thus early teach all to feel that every one has duties, on the performance of which other people are dependent. Give to one the garden; to another the yard; to another the potatoes, etc. It is well to give each one a patch of land to do with as he or she pleases; but give each one some share in the common stock as well, increasing the share and extent of responsibility as fitness for it warrants. Be watchful yourself, but let it always be in a spirit of genuine interest, not from lack of confidence. Be ready with advice when asked for or absolutely needed; but in the latter case, remember that experience is a pretty thorough teacher.

If your boys see that you are willing to consider the advice of others and read that given in some good agricultural paper, they will feel the freer to come to you while you will be the better able to assist them.

If you can influence a neighbor to let out a portion of his farm among his boys, so much the better for your own. A friendly competition will be pretty sure to follow.

Nor are the girls to be forgotten in these plans. Give them something aside from the usual household drudgery so that they may also look for some returns besides the return of their tasks.

Use your leisure hours in keeping up with the times. Don't give your children chance to feel that to become a farmer means to retire from all the outer world. Youth paints all walks of life in brilliant colors and loses interest first in that which seems diverging farthest from the rest.

Don't always talk of the work on a farm never being finished. This saying is no truer of the farmer than of the true man everywhere whose work is only finished with his life. Avoid unnecessary shadows in the farm picture, but don't wholly evade comparisons with other occupations if others bring them up, as any child might suppose that in that case, you thought farming would appear to disadvantage.

Encourage originality and let your children see that as yet the room for advance is limitless. Thus by always keeping them employed with business of their own, you can tide them over the most fickle portion of their lives, at the same time teaching them self-control as well as self-reliance and making themselves into true men and women. Then those whom Nature meant for farmers will be true to her decree, and it is only those we wish to keep; while those who have some other mission to fulfill, experience has proved, will the more readily find their true calling and be the better fitted for it by the broad and generous natural education every intelligent and observant farmer must acquire.

WILDER GRAHAME.

A LIBERAL EDUCATION.

"IT is an inspiration to go through Mrs. D—'s house, and a liberal education to see her sweep and dust a parlor," said a friend, speaking of a mutual acquaintance whom she had just visited. "You see she takes the best household magazines, and profits by what she reads; in short, she *does* the things which you," with a glance at my inky fingers, and a merry laugh which robbed her words of their sting, "which you *write* about."

I looked at the ink-stains, and then at some rather dusty bric-a-brac, with a sort of *mea culpa* expression, but since I have reflected on my friend's words, I have come to the conclusion that if I am helping to make good housekeepers I am perhaps doing as much good as if I merely ministered to my own pleasure and sense of neatness by keeping my shelves and vases immaculate. In my own secret heart I know that I can sweep and dust a room as well as Mrs. D—only sometimes through stress of other duties I delegate those duties to Norah, with strict injunctions to let every breakable article severely alone. Still the readers of the RURAL are entitled to the best that I can give, so with the modesty which is a well-known attribute of my profession, I shall step on one side, and tell them just how Mrs. D—proceeds to sweep and garnish her house.

First, she arrays herself in her sweeping apron, three breadths of light print gathered on a band, and descending to the bottom of her morning dress. Next she dons a white muslin mob-cap, from which her sunny little curls escape here and there in the most bewitching manner. Lastly she draws on a long pair of wash-leather sweeping gloves, for a daintier little lady never wielded a broom, and her pink palms, and rosy nails never bear about them a suggestion of housework.

Being ready for work, Bridget is now summoned, and the heavy cushioned arm-chairs, sofas, and lounge are carried to the wide veranda where they are well beaten; tables and lighter chairs are dusted and taken into an adjoining room; rugs, large and small (there are no carpets) are also taken to the veranda, and subjected to a thorough sweeping on both sides, those that are not too heavy for Bridget's stout arms are thrown over the clothes-line and thoroughly beaten. Meanwhile our pretty housekeeper is industriously dusting and placing on the tables in the next room many precious bits of porcelain and pottery. Next, the book-cases all of which are open, are dusted, the shelves being emptied one by one, wiped with a damp cloth, and the books dusted and returned. These articles of furniture are then pinned up in dusting sheets. Portiéres, and curtains are lifted down, carried out-of-doors, shaken and laid on one side. The floors are then swept after which the picture-frames are dusted, and the glass washed and wiped; paint is wiped, not forgetting the tops of the doors, and windows are polished. The highly polished floor is then washed with warm water and now to bring order out of confusion it is only necessary to replace the already dusted and cleansed furniture and ornaments, and our education is complete.

PALMETTO.

BREAD FROM ENTIRE WHEAT.

In answer to an inquiry as to making bread from the entire grain, we cannot do better than republish the directions given by Alice Brown in the RURAL of March 31, 1888.

At night, one quart of sweet milk is heated to the boiling point and one teaspoonful of butter (or one half pint of sweet cream) two table spoonfuls of granulated sugar, and one-fourth tea-spoonful of salt are added, stirring them in well. When cooled to blood heat, a small quantity of any good yeast is stirred in, and flour enough to make a thick batter. Set where it will keep warm over-night. It is made into a stiff dough in the morning, when light, molded into loaves, raised again, and baked in a steady heat. The loaves we enjoyed were baked in one-quart fruit cans from which the rims around the tops had been removed, and but a pint loaf was necessary to fill the can, when raised, even then puffing above the rim.

EXTRACTS FROM PRIVATE LETTERS.

Amen! Amen!! Is what I want to say to Leila S. Tavlor's views on "Civil Government in Schools," and to the review of Dr. Lucy Hall's lecture on "Sanitation in the Country." One reform is almost as much needed as the other.

The millennium must be nigh when a "lord of creation" can write such an article, as did Mr. Terry, on Woman's Rightful Position, in the RURAL of Jan. 19. And the Editor endorses it! Well, well, I wish my grandfather could have lived till now; probably tho', he'd wish he *had* died before these *degenerate* days came.

MISS E. B.

As to Charity's "Reveries," the shoe doesn't pinch me. Thank Heaven! I have a wife who cares more for *my* well-being than for a dozen "blots." If necessary, the work incident to slaughtering could be done in the kitchen and she would cheerfully clean up, even if I did not.

G. H. S.

Don't omit the Sunday Evening Talks too often—they deal with such *practical* religion.

MISS E.

HAM AND POTATO CROQUETTES.

One cupful of finely chopped cooked ham, one of fine bread crumbs, two of hot mashed potatoes, two beaten eggs, a spoonful of melted or soft butter, pepper and salt if needed. Mix thoroughly together when somewhat cool, shape into oblongs, roll in a beaten egg then in cracker dust, put into a wire basket and plunge into hot fat. Cook about two minutes. Drain and send to table at once.

TAPIOCA PUDDING.

Soak a cupful of tapioca over-night in a quart of water. In the morning drain off any water left, put the tapioca and three pints of milk into a double boiler and cook 45 minutes, add a cup of sugar, a spoonful of butter and a cup or more of canned peaches or pears cut into little pieces. Cook 10 minutes longer and turn into a mold or bowl. Eat cold with sugar and cream.

MRS. ECONOMY.

Miscellaneous Advertising.

YOUNG CHILDREN

Are so liable to Croup, sudden Colds, and various throat troubles, that no family should be without

AYER'S Cherry Pectoral

It gives instant relief and effects a permanent cure.

News of the Week.

HOME NEWS.

SATURDAY, February 2, 1889.

THE Ohio House has passed a bill providing for execution by electricity .....The Massachusetts and Pennsylvania Legislatures favor Prohibitory amendments to the constitutions of their respective States.....The American Federation of labor proposes to start an eight-hour agitation to culminate in ubiquitous strikes on May 1, next year. It urges workmen to hold mass meetings on Washington's Birth-day this year and next, and on the Fourth of July and Labor Day—Sept. 2,—of this year.....The capital of Arizona has been changed from Prescott to Phœnix..... ....Oklahoma boomers are pouring into the territory by hundreds, and are being driven out about as numerously by the United States troops. Some who refuse to move are tied to wagon backs and forced to trot along. A large batch are to start south from various points in Southern Kansas today . . Charles A. B. Shepard, of the well known book firm of Lee and Shepard, of Boston, died Jan 25, aged 60 years..... Vanderbilt University, at Nashville, is to give free instruction in road-making to Tennessee county highway officials during February and March..... ...The Senate has passed the tariff bill by a strict party vote of 32 to 30.....Cabinet-making has been the busiest industry in the country since the elections. The upset at present appears to be Blaine, Secretary of State; Allison, Secretary of the Treasury; Alger, Secretary of War; Wanamaker, Post-master-General, with three other Cabinet positions to be filled from hundreds of candidates..... All the flouring mills in St. Louis have closed down in accordance with the agreement at the late Milwaukee convention, under which 250 mills in the fall-wheat belt were either to close down or run on half time during January. The Minneapolis mills are grinding only about one-third of their full capacity..... A mammoth cotton palace is to be erected in New Orleans, in which the products of Louisiana and other States will be exhibited during the carnival week. .....The reduction of the public debt during December was $14,427,595.... ....During the past year 1,800 girls have been graduated from the Boston cooking schools ...Controller of the Currency, W. L. Trenholm, has resigned, and J. D. Abrahams of Virginia, has been nominated for his place.....Upwards of 400 nominations made by the President are "hung up" in the Senate, which, it is expected, will refuse to act in nearly all of them, so that Harrison may be able to fill the places after March 4. When Cleveland came in, all Arthur's nominations had been acted on except 36.....Recently a number of German sailors were landed from a German war vessel near Apia, the chief town in the Samoan Islands, to help the native German pretender to the throne, Tamasese, against the American favorite, Mataafa. The followers of the latter attacked the Germans and killed over 20 of them, wounding about 35 more, some of whom have since died. Bismarck has declared war against Mataafa, and the Germans are searching all vessels that come near the islands for goods contraband of war. Secretary Bayard says America has no valid grounds for war with Germany on account of the Samoan embroglio. There's a good deal of Jingoism, however, about the matter. Some newspapers would plunge the country into a vast war to add a few thousands to their circulation. Bismarck wants a friendly settlement. . .. The Senate is not likely to confirm the late extradition treaty with Great Britain. Canada wants to abandon the *modus vivendi* brought about by Chamberlain's rejected Fishery treaty, which authorizes the issue of fishing licenses to American vessels..... The total number of immigrants arriving in the United States from all countries, save Mexico and Canada, during 1888 is 518,518 against 510,058 the previous year. ..... There is talk of making ex-Senator Warner Miller, of New York, the next Commissioner of Agriculture in the expectation that he may soon become a Cabinet officer. The agricultural colleges and experiment stations appear to be opposed to such a measure..... ..... Robert M. Steel, of Philadelphia, has bought the California trotting stallion Antevolo for $30,000 ..... A big street-car strike in Brooklyn and New York has greatly impeded travel during the week. The men struck simply because the companies refused to have anything to do with their labor organizations, while ready to settle complaints with the men individually. Considerable rioting in places; but the companies appear to be getting enough new men to run the cars, and they refuse all offers of arbitration.....Pennsylvania legislators propose to inflict three years' imprisonment and a fine of $1,000 on White-Caps who may send intimidating letters, circulars, posters, etc., to any person.....

A Sudden Change of Weather

Will often bring on a cough. The irritation which induces coughing is quickly subdued by BROWN'S BRONCHIAL TROCHES, a simple and effective cure for all throat troubles. Price, 25 cents per box.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, February 2, 1889.

AT the 34th meeting of the New York State Horticultural Society held at Rochester on January 23 and 24, the following officers were elected: President, Patrick Barry; Vice-presidents, S. D. Willard, Geneva, W. C. Barry, Rochester, W. Brown Smith, Syracuse, J. S. Woodward, Lockport; Secretary and Treasurer, P. C. Reynolds, Rochester; executive committee, C. M. Hooker, Rochester, Lewis Chase, Rochester. B. W. Clark, Lockport, C. W. Stuart, Newark, Nelson Bogue, Batavia. President Barry made a munificent donation of $2,000 to the funds of the society.....The Kansas Senate has passed a bill restricting the ownership of real estate to American citizens, and limiting the area of land that can be held by corporations. The House is sure to pass it....A 20-months-old hog, recently killed at Freehold, N. J., weighed 832 pounds. The owner killed two some time ago which weighed 2,050 pounds ..... The Agricultural Appropriation Bill completed Thursday, asks Congress for $1,636,010..... The 14th annual meeting of the Ayrshire Breeders' Association will be held at the Fifth Avenue Hotel this city on February 21, at 2 P. M. W. Winslow, Secretary, Brandon, Vt. ..... The New York State Cane Growers' Association will hold its ninth annual meeting at Grange Hall, Fairport, on February 12 and 13.....Farmers in South Carolina and several other Southern States are furious against colonization agents seeking to induce their hands to move elsewhere. Several of them have been hung lately.... .....

Measuring to Emergency.

It is not well to believe all you hear. This is even a worse fault than faith in nothing. Among other dismal precedents we have long accepted, is the belief that catarrh is incurable. But precedent is seldom cheerful and often inexact. It comes to us from a time when means were unsuited to the ends in view.

We alter this proportion in these days. For success implies the ability to measure to emergency, no matter how desperate. In this way Compound Oxygen is valuable. At least such is the inference from the following:

ALMA, Neb., February 13, 1888.

"I do unhesitatingly say that Compound Oxygen will cure catarrh."

HON. H. C. GRIFFTH.

ATLANTA, Georgia.

"I still recommend your remedy to my friends who are afflicted, and why should I not? It saved my wife's life and cured my boy of catarrh." MR. WALTER T. FORBES.

COLUMBIA CITY, Ind., March 19, 1888.

"It is about three years now since I had used treatment to such good purpose for catarrh, and I find it has not lost its virtues in the least." HENRY MCLALLEN.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

"Herbrand" Fifth Wheel for Buggies.—*Adv.*

The Kodak.

PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

Literary.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

IT was some little time before the minister re appeared. Jim and Ben became quite impatient, for it was getting late At last the little man re-entered the room with his violin under his arm. He did not possess a case for this valuable instrument, and so he had wrapped a number of garments about it. He looked more like a man in search of a laundress than a violin soloist.

"Wall, Parson," announced Jim, "ef yer reddy, why we be," and he opened the door at once.

With his melancholy hat dropping even more dismally than before over his face. and his long coat beating an indignant protest against his legs, the Rev. Mr. Grayling followed his conductor.

Cobb's store was located in the one "business block" of Drum Lake. Time had been when Cobb could have stated with some degree of truthfulness, that his stock of goods was "the largest and most complete ever brought into Northern Michigan." But now the great stock of goods, like the greater part of the occupation of its owner, was entirely gone.

A few dry-looking articles looked down from the great shelves, as if inviting the customer to purchase, and yet well aware of the fact that no man in his right mind would do so. The sugar barrel had lost its business grip on two of its hoops in utter hopelessness. The rusty scales had long since given up all thought of doing justice to the customer, and drooped down at one side as if weary of life. As the advantage of this droop was with Cobb, he had never tried to remedy it.

The profits from Mr. Cobb's legitimate mercantile business would hardly have supported him in elegant style, so he had been forced to add several branches to his business, that he would have laughed at years before. He had even found it necessary to give a series of social assemblies during each winter in order to eke out his expenses. He had fitted up two rooms at the back of his store for the purpose, and twice each month did he issue his invitations to the citizens of Drum Lake and vicinity, to dance and be merry.

It was into one of these rare occasions that the poor, unwilling minister was brought. His new friends led him through the vacant store, past the miserable scales and the hopeless sugar barrel, and looked in with him at the company gathered in Cobb's back room.

The merry-makers had danced to the music of Bill Gammon's voice until the musician, anxious to keep himself in trim for his contest with Jeff Price, declared "that the sound rasped agin his throat."

At the time of the minister's arrival, the floor was held by one Snooks, who had held the position of "boss fool" until Mr. Grayling came to try and "build up St. Paul's Church." There were some who still claimed that Snooks had never been fairly driven from his position,

The Drum Lakers believed in monopoly to a certain extent. There should be,according to their philosophy,but one "boss" and one "fool" in every community. Both of these important positions should be filled by some one, but it needed either a most decided superiority or a great outburst of popular feeling to bring about a change. Perhaps the Drum Lake idea of civil service reform may be of some interest to the public

Here it is in substance: So long as a man shows himself to be a fool, keep him in office, but if it is discovered that he knows more than some one else in the community, kick him out at once.

As the Rev. Mr. Grayling looked into the room, Mr. Snooks was in the very act of delivering a recitation. It was nothing from Shakespeare or any of the more dramatic authors, but that touching lit le gem, "Twinkle, Twinkle Little Star." One only needed to glance at the poor fellow to see how he came to fill the position of a fool. The half-opened mouth and vacant eye, told of a vacant, half-opened mind. The great, burly fellow stood by the stove throwing his long arms about, and moving his head in a frantic attempt to imitate the twinkling of a star. The audience sat about on the board seats shouting with laughter at the performance. Poor Snooks took all this for applause, and redoubled his efforts to please. No wonder the minister drew back at the sight. I think he would have gone to Mrs. McKelvey's had not Jim pushed him into the room. Once inside there was no escape, for Ben Stone placed himself in the door as a barricade.

There was a lull in the storm of applause as the minister made his forced entrance. Snooks took his seat, and the whole company sat looking at the reverend visitor at a loss to know how to receive him.

The little man *did* present a ludicrous appearance, with his head thrust forward in his odd way, the old hat on his head, the long coat creeping behind his legs for protection, and the shapeless bundle under his arm. He was enough, as Bil lGammon afterwards said, to "make a cat laugh."

Jeff Price who was to sing later in the evening, stood leaning against the wall. He had never met the Rev. Mr. Grayling, and knew nothing of his clerical dignity; he simply knew that before him stood the most melancholy specimen of humanity he had ever seen.

"Wall," he remarked "what bone-yard's ben opened ter day?"

Mr. Grayling showed by his manner that he did not understand.

"What bone-yard hez ben opened?" roared Jeff, thinking the little man must be deaf. The minister studied the question carefully, but "bone-yard" was too much for him.

"I fear, sir, that I fail to comprehend your exact meaning." This was too hot a volley for Jeff, and he edged away from the speaker as if fearful that the next well-rounded sentence would injure him severely.

Jim Foster who had been holding a whispered consultation with his friends, now came to the rescue. "Parson," he said, "we're ready fer ye; jest stand out an' I'll introduce ye' roun'."

Much against his will, the Parson came forward. Then Mr. Foster, with his great hand laid patronizingly on the shoulder of the minister, began his introduction.

"Gentlemen and"—noticing the few females at one side—"ladies, this is the new Parson. He's go'nter preach termorrer down ter Bill McKelvey's. Ye all wanter come, fer its go'nter be a big show. Kin anything git out Nazzereth is his idee. He wanted ter kinder git acquainted round, so I invited him up ter see how things was. He kin jerk a bow all round Hank Jacobs, an' now he'll play ye a couple of tunes. Pile in, Parson, an' show em how," and Jim came to the end of his oration whispering, as an aside to the minister, "How's thet fer a send-off, eh Parson?"

The poor, little minister was like a child in the hands of his conductor. He took the chair that Jim brought him, and, laying his hat on the floor, began to unwrap his violin. Jim rubbed his hands together in great glee at the success of his experiment. He whispered his instructions to the rest, and about half the company at once left the room, and, under the supervision of Cobb, arranged themselves for a dance. Jim took his place in the set nearest the door, so that he might encourage the minister if necessary.

Mr. Grayling was very deliberate in his movements. One by one, the garments were pulled away, and at last the beloved fiddle came into view. An ordinary musician would have said that time enough had been spent already in tuning; but Mr. Grayling was evidently no ordinary musician. In utter ignorance of the fact that the company stood waiting for him, he placed the fiddle under his chin, and began the most elaborate system of tuning to which Drum Lake had ever listened. As Bill Gammon afterwards described it, "it wuz jest saw, saw, saw with that bow agin them strings tell yer teeth 'peared ter be grittin' agin each other."

The dancers stood in silence for awhile, but at last some of them began to grow impatient. "Wake up an' pay fer yer lodgins!' Git a-goin'! Set 'em afire!" and such advisatory phrases came to the little man's ears.

Jim Foster did his best to keep order. "He's go'nter take his time so he kin do a clean job an' make lots o' chips," he explained.

At last, just as the last scrap of patience was being torn in pieces, the minister rose with his fiddle in position. Turning his back to the company, and swaying his body to and fro in time with the music, he began, not the lively tune that the company expected, but the slow beautiful music of "The Bridge."

At the first sound of the music, Jim Foster called, "Honnors to yer pardners!" and himself began a most elaborate bow to Jake Hogan who was acting as his "lady." It was a most elaborate bow, yet somehow it failed to combine with the music. It ran so far ahead of the slow, wailing melody, that it instinctively stopped to wait for the music to catch up. Not being willing to take any unfair advantage, Jim found himself in a most undignified position, with his head thrust forward, and his back bent at an unpleasant angle.

The rest of the company were in much the same predicament. Each couple stood with heads pointed at each other, not unlike two warlike roosters about to spring. The dancers straightened themselves in wonder, and looked at the musician. Who could possibly dance to such music as that? Why a lame man would have ample time to go through all the figures and take a rest before the music could ever catch him.

Jim Foster was ready with his excuse, "It's all right, boys, he's jest playin' a sorter overchewer like. He'll come out of it all right, only give him time."

Some of the dancers kept their places on the floor, but most of them went back to the seats to wait till the "overchewer" was completed.

ADDRESS

THE RURAL NEW-YORKER

34 Park Row, N. Y.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

PROPERTY OF MINORS.

A. S. M., Williamsport, Pa.—About three years ago one of my young sons got a present of a young colt from an uncle. He has petted and cared for it ever since, and it has always been looked upon as exclusively his property. Being of good stock, it is now worth several hundred dollars. Not long since it was seized for debt by a person to whom my husband—the boy's father—owed some money. I gave a bond and replevined the animal; does this bond cover only the value of the animal or the judgment against my husband; and to whom does the animal belong?

ANS.—As a general rule, when a minor receives property from any other person than his father, it is his, and his father's creditors have no right to it. In the present case, no doubt a good deal of the value of the animal came from the food supplied by the father and the labor of the boy, which belonged to the father; but so long as the father does not make any claim for compensation on these accounts, a creditor of the father can hardly make such a claim for him. Indeed it is very likely that, under the circumstances stated, any court would decide that the animal belongs to the boy. The bond given on replevining the animal covered only the damages caused by the taking of it, should it be decided in a suit at law that you had no right to take it. The measure of that damage would be the value of the animal and not the amount of the judgment against your husband, unless the value of the former was greater than the amount of the latter, in which event, if the case should go against you, the balance should be given to your husband after the costs of the plaintiff had been deducted.

AN ALIEN'S OATH OF ALLEGIANCE TO THE UNITED STATES.

A. B., Centralia, Ont., Canada.—1. Will the RURAL give the oath of allegiance required by the United States from those who want to be naturalized. 2. Would the Democratic party in the United States represent the Conservative or Reform party in Canada in regard to free trade or protection?

ANS.—1. The oath of allegiance is as follows I, A B., do solemnly swear that I will support the Constitution of the United States of America, and that I do absolutely and entirely renounce and abjure all allegiance and fidelity to any foreign prince, potentate, State, or sovereignty whatever, particularly to (give name of sovereign) to whom I was a subject. A. B. (Any title or order of nobility must also be renounced.) 2. So far as free trade or protection is concerned, the Democratic party in the United States corresponds to the Reform party in Canada; while the Republican party corresponds to the Conservative party.

A HUSBAND'S PAYMENT OF MORTGAGE ON HIS WIFE'S REAL ESTATE.

H. S., Canandaigua, N. Y.—My wife owns some real estate which is mortgaged. Can I pay off the mortgage so that at her death, if the property should be willed to her relatives, I can hold the mortgage against it? I would like to pay off the mortgage, but cannot afford to lose the money or to give it to my wife's relations. Could my wife will to me or my heirs the amount of the mortgage in case I paid it off?

ANS.—The wife could make a will giving to her husband the amount he had advanced if he survived her; but this would be no security, as women, like men, have been known to change their minds occasionally, and in this case the wife might tear up her will and make a new one from which the husband might be entirely excluded. The best way is for the husband to buy up the mortgage (not to pay it off and discharge it from record) and take an assignment of it, holding it in his own name as a lien on the property.

A LAND LEASE.

T. M. T., Troy, N. Y.—For some years I have leased a farm not far from here from A. The lease runs out on May 1, and A has just sold the land to B. The latter wants to give me another lease for five years beginning at the end of my present lease, but insists that I should pay him down $250 in cash as security, on which amount he will allow four per cent. interest, the principal to be paid back at the expiration of the lease—five years from May 1. Should B sell the land to another party before the expiration of the old lease and before the new one comes into force, would the new lease hold good with the purchaser, the lease having been made, and the security given prior to the expiration of the old lease?

ANS.—If the new lease is duly executed by B, the present owner of the farm, and is then put on record, it will stand against all changes of title until its terms are fulfilled.

AN ASSIGNEE MUST RENDER A FULL ACCOUNT.

V. L., Caledonia, N. Y.—Can an assignee be compelled to show books, papers and receipts that a creditor or creditors may see that he has done justice to them?

ANS.—Yes; an assignee is a servant of the creditors. His office is to do justice to them and the debtor, but his duty is as much to them as to the latter. Hence he is bound in justice, and is equally bound by law, to show vouchers for all he may do, and he can only be legally discharged from liability by rendering a full account with exposure of books, accounts, etc., and getting a receipt and discharge from the creditors.

S. T. L., Syracuse, N. Y.—A and B work a farm on shares. A hires a man by the month sells his share of ths crop and does not pay his help. Can the help collect his pay from B?

ANS. No; the help has no claim on B for his pay.

T. S. M, Rochester, N. Y.—In this State is a man compelled to support his aged father who is about to become a charge on the county?

ANS.—Yes, indeed, by the laws of nature as well as by those of the State, and he may be compelled to support his parents in a suitable way under penalty of fine collectable by attachment.

V. L., Caledonia, N. Y.—What justice is there in the law which permits any bankrupt concern to give preference in payment to any one besides laborers? Those who get preference nowadays are the best able to bear the losses.

ANS.—There is no feature of our present bankruptcy laws which is so frequently abused as that which enables the bankrupt person to "prefer" favorite creditors for payment. In very many cases the debts so "preferred" are bogus, nominally due to the bankrupt's wife or father or other member of his family. The bankrupt laws as a whole urgently need revision and amendment, and this provision more than any other.

CATALOGUES, ETC., RECEIVED.

TESTS OF VARIETIES; FORAGE PLANTS.—Bulletin No. 6 from the Pennsylvania Experiment Station, is an interesting one. Tests of a number of varieties of wheat, oats, barley and potatoes have been made, and the results are given in this pamphlet. Such tests are of service to Pennsylvania farmers who like to seek out new and improved varieties. It may be considered reasonably safe for them to try, in a small way at least, the varieties that do well at the Station. From last season's trial, the Station authorities conclude that the R. N.-Y. No. 2 potato is "a fine variety and worthy of more extended trial." An interesting account of the history and habits of the Manshury Barley will be found in the bulletin. The forage plants tested were Prickly Comfrey, Kaffir corn, cow peas, Teosinte, White Mustard, and Brazilian or Flour corn. The Flour corn was killed by the frost, and the Teosinte did not germinate. Comparative analyses of the other four plants are given to show the total crop per acre, the amounts of crude nutriment and also the amounts of digestible materials per acre.

INSECTS INJURIOUS TO CABBAGE.—Bulletin L. of the New Jersey Experiment Station, gives a list of the insects that prey upon cabbage plants, with good illustrations, life-histories and habits and the best known remedies. The policy of this Station is to have the Entomologist take one topic at a time and work it up carefully. This is a good plan. The present bulletin is about the best thing in its way that has yet been published.

KODAK CAMERA.—Catalogue from the Eastman Dry Plate and Film Co., Rochester, N. Y. Some few weeks ago we called attention to this camera which we classed under the head of sterling novelties. It is, in our opinion, one of the most interesting and important inventions of late years. Fifteen years ago the telephone was a novelty—practically an untried device. To-day it is a household necessity with thousands. Up to within a few years the art of photographing was monopolized by a few. Fifteen years hence the public will find that the camera will be almost as necessary as the telephone, and something very like the Kodak will be in general use. This catalogue is interesting and instructive.

GROWING CORN FOR FODDER AND ENSILAGE.—This is the title of Bulletin No. 4 recently issued for the New York Experiment Station. Do the farmers of New York State need to be told how to grow corn for fodder? Prof. Roberts seems to think so, for he says that a large majority of the farmers of the State, who annually raise a patch or a small field of fodder corn, still sow it broadcast. He claims that those who are most successful in making silage of a good quality have settled, beyond any doubt, that the corn must be grown either in hills or drills with much the same cultivation that is given the crop when grown for the grain. To present the truth of this claim as forcibly as possible, various plots of ground were planted with corn in hills, in drills and broadcast. The product of each plot was carefully weighed, and careful analyses were made at various stages in the growth of the plants. The results of these experiments are very forcibly shown in the bulletin. They are what any thoughful farmer would have expected. The drilled corn gave by far the best yield and the best quality of stalks. Plants cut September 3, gave twice as much nutriment as those cut August 8, and four times as much as those cut July 24 The subject is an interesting one well worked up.

Humorous.

The RURAL NEW-YORKER *is prepared to offer very liberal terms to good, responsible,* PERMANENT *agents. Correspondence solicited.*

THEY were talking about the Atlantic cable. "It reminds me of a good egg," he said. "A good egg?" "Why, yes; being so successfully laid,"—*Ocean.*

"WE never furnish a knife with pie," said a prim waiter at a Keokuk, Iowa, boarding house. "Then bring me the ax," cried the new boarder in despair.—*Mich. Farmer.*

AN applicant for a pair of boots at one of the Boston shoe-stores was asked what number he wore, and replied, as soon as he recovered his surprise: "Why, two, of course."—*The Courier.*

MRS. HOMESPUN, who has a terrible time every morning getting her young brood out of their beds, says she cannot understand why children are called the rising generation. —*Prairie Farmer.*

MISS TRAVIS: "Don't you think my new dress is too sweet for anything?" Miss DeSmith: "Oh, lovely—exquisite! I do believe your dressmaker could make a bean-pole look graceful!"—*Burlington Free Press.*

QUEVEDO: "I see the savants are about to investigate the cause of yellow fever in the South." Miss Foote (Chicago): "How noble! But I don't remember to have met them. Are they a North Side family?"—*Phila. Record.*

MISS GRACE: "Peculiar costume for a man to wear, isn't it?" Uncle George: "Yes but do you know that at one time the men in the United States wore dresses?" Miss Grace: "Why no; when was that?" Uncle George: "When they were infants."—*Harper's Bazar.*

A PROBLEM IN DIVISION: The meanest man up to date is Snifkins. He sold Jones a half-interest in a cow, and then refused to divide the milk, maintaining that Jones owned the front half. The cow hooked Snifkins, and now Snifkins is suing Jones for damages.—*Time.*

SLOOPKIN (as an illustration of the rapid growth of Western towns): "Why, Blockly, only seven years ago a band of Ute Indians held a war dance right here on this lawn! Think of that, sir!" Blockly (not to be astonished): "Why, I'd thought they'd broken the vases and trampled all the shrubbery down."—*Harper's Bazar.*

MISTRESS: "What on earth are you going to do with that scuttleful of dirt, Mary?' Mary: "Dust the pianner." Mistress: "Dust the piano?" Mary: "Yis. Didn't ye tell me to dust it 'm? An' it's takin' ivery bit of dust I can foind."—*Buffalo Courier.*

A GENTLEMAN of Americus—who, by the way, had a fad or two—was walking down town the other day with a witty lady, the intimate friend and guest of his wife, when he began to revile facetiously the gait and carriage of her sex "Even you," he said, "walk with a very mechanical step." "Yes," she instantly answered, "I am going with a crank."—*Vinton Eagle.*

THE COMING CONDUCTOR.—"Gentlemen," shouted a passenger on a south-bound suburban train a day or two ago, "keep your seats. Restrain yourselves, gentlemen. These ladies in the aisle can all stand up. They're used to it—on this line." Seventeen sheepish-looking gentlemen at once rose up and crowded forward toward the smoking car.—*Chicago Tribune.*

GOOD REASON WHY.

STOUT PARTY: "Why, why, I'm astonished to see a young man of your size crying like that!"

YOUNG MAN: "I guess you'd cry too if you'd a' loved as I have, and then a' had your best girl took from you by a man yer hated!"

THE WONDERFUL PEACH.

The cut shows the form one-half diameter or quarter natural size. Largest specimens measure a foot in circumference and weigh nearly a pound. Rich yellow with carmine cheek; of very uniform size, shape and mould; firm, rich, juicy, excellent; the flesh is yellow and bright red at the pit; a perfect freestone; ripens the second week in October (or after the Smock) and lasts two weeks after it is picked. The tree is a strong grower, bears every year and more than the tree can carry. The best yet for canning and evaporating. As remarkable for flavor as for size and beauty. Its name has been spoken spontaneously without knowing it by hundreds of people on seeing it for the first time, "Wonderful!" As good as Crawford's Late in other respects and bears on the average three times as much fruit. The only time it was placed upon exhibition it was awarded a first premium over all others and a special premium of a Silver Medal. Full information (history, description, prices of trees, testimonials of experts, &c.) and a colored picture of it mailed free. Also a pamphlet on the culture of the Peach with descriptions and prices of all the standard and new varieties.

Lovett's Guide to Horticulture, a handsome book of nearly 100 pages, finely printed and over 200 illustrations, describing every kind of hardy Fruit and Ornamental Tree and Plant, new or old, giving both defects and merits; replete with instruction on planting, pruning, culture, &c., and quoting Trees and Plants at half what they are usually sold for, will be mailed, with colored plates for 10 cents, or without plates free.

Plants by mail to all points of the Continent a specialty,

Mention this paper and a copy of *Orchard and Garden* will be mailed free.

Reports on New Potatoes.

Results of Planting in Trenches of Different Depths—Ten, Eight and Four Inches.

THE MONROE COUNTY PRIZE, has been praised very highly in several farm journals during a month or so past. It was sent to us by Sibley & Co., of Rochester, N. Y., and planted May 9. Eight hills yielded 27 pounds. There were 81 potatoes, many of which were not of marketable size. In how far the ravages of the flea-beetle caused this we can not say. The yield above stated would be at the rate of 816 bushels to the acre. In shape it is rather long and elliptical. The eyes are somewhat deep and medium as to number. Skin buff. Eaten January 11. White flesh, quality-fair. It is claimed for this potato that it is "enormously productive and by all odds the best keeper."

BURPEE'S SUPERIOR POTATO. This was originated by Mr. E. L. Coy, to whom we are indebted for many excellent varieties. It was sent to us as No. 88, by W. Atlee Burpee, of Philadelphia, Pa. It is said to be of fine quality and shape, and to yield heavily. The vines were killed in the early part of the season by the flea-beetle, and the yield was inconsiderable

MINISTER from Geo. W. P. Jerrard, Caribou, Maine. Two pieces yielded 8½ pounds, or at the rate of 1,028½ bushels to the acre. There were 18 large and four small tubers. Skin light, shape variable, inclining to oblong, flattened, eyes rather deep. This was injured slightly by the flea-beetle. Eaten January 8. Flesh, yellowish-white, fine-grained—a sort of crystalline texture, as they say of watermelons. Quality excellent.

GOLD FLESH, from W. Atlee Burpee & Co., Philadelphia, Pa. Three pieces yielded 10 pounds, of which 24 were and eight were not of marketable size. Skin purplish; raw flesh yellowish, deepening to a straw-color when cooked. Rather long, cylindrical; eyes medium as to number and depth. The above yield would be at the rate of 806.66 bushels to the acre. The vines were injured considerably, but not destroyed by the flea-beetle. Eaten January 14. Quality fine-grained and very good.

TONHOSKS (?) from Theron E. Platt, Newtown, Conn. Two pieces yielded 10⅓ pounds, 28 marketable, 19 small. This is at the rate of 1,270.50 bushels to the acre. Medium as to length, somewhat flattened. It is about the shape of the Beauty of Hebron. Eyes medium in number and depth. Skin light-buff. Slightly injured by the flea-beetle. Eaten January 6. Flesh white and mealy.

BROWNELL'S WINNER from E. S. Brownell, Essex Junction, Vt. He says it is a cross between White Star and Peachblow. But two pieces were planted. These yielded 15¾ pounds—a yield rarely exceeded in the rich garden plot which for years has been given to these tests. There were 32 marketable potatoes, and but seven unmarketable. Five of the largest weighed 3½ pounds. The characteristic shape is roundish-elliptical, slightly flattened. There are few eyes, and these while not quite even with the surface, are not deep. The skin is a rosy-pink color. Three or four of these potatoes were eaten January 20. The flesh is white and mealy, of the flavor of the Early Rose class. The center of the potatoes was a little hard, but this may have been owing to insufficient cooking. We regard this potato as a most promising variety. We shall use some of them in our next "Contest plot." The illustration (Fig. 33) is from a photograph of the average size and may be accepted as a fair portrait. It is a late variety. The vines are wide-spreading and very vigorous, and were not injured by the flea-beetle.

DANDY, from Geo. W. P. Jerrard. Two pieces gave six pounds, or at the rate of 726 bushels to the acre. Shape rather long, often smaller in the middle. Skin white. Eyes medium in depth and number. Eaten January 13. Flesh white, mealy and close-grained. Quality fair.

EARLY MAJOR was so injured by the flea-beetle that we cannot make any report as to its earliness. It was received from T. P. Thomas, Wheeling, West Virginia. Two pieces yielded seven pounds—21 of fair size; 12 small. Cylindrical, color of Early Rose. Eyes medium in number and depth.

ISLAND RED (from T. P. Thomas as above), a red potato from J. A. Everitt & Co, No. 79 from C. E. Angell, 80 High street, Oshkosh, Wis., and a seedling from J. H. Woodburn of Sterling, Ills., were so injured by the flea-beetle that anything like a fair report is out of the question.

THE ORIENTAL SPRUCE. From Nature. Fig. 34.

WHITE EARLY OHIO from T. C. Davenport, 124 Dock street, Philadelphia, Pa. Four pieces gave 13½ pounds—46 large, 20 of unmarketable size. Rather long; cylindrical. Eyes medium as to number and depth. Skin rosy-buff. A fair-looking potato. Eaten January 4. Mealy and good. Flesh nearly white. Vines died early on account of flea-beetle injuries.

This trial plot has received at the rate of from 1,000 to 1,500 pounds of the Mapes potato fertilizer each season for many years. It has also received stable manure, lime, kainit, etc., as stated in previous reports. *The R. N.-Y. potato trials during* 1888, *were, for the greater part, partial or total failures owing to the depredations of the flea-beetle which we were unable to subdue or control.* The season was a wet one throughout.

RESULTS OF PLANTING POTATOES IN TRENCHES OF DIFFERENT DEPTHS.

The soil of these plots, naturally variable, was made exceedingly so by grading, the soil from the higher parts having been carted to the lower places. It is in some parts a sandy loam, in others a clay loam, and in still other parts a stiff brick clay—all impoverished by years of cropping without any manure of any kind. It will be remembered by older readers that the R. N.-Y.'s potato experiments previous to last year were made on plots of notably uniform soil, so impoverished that anything short of a "complete" fertilizer failed to materially increase the crops.

This was proven so conclusively that there seemed to be no reason why the trials should be continued upon them.

Our present report, as might well have been supposed from the variability of the soil, seems to show that the *depth* of planting should be governed by the character of the soil. At the rate of 800 pounds of Stockbridge potato fertilizer was sown in the trenches after the seed-pieces were lightly covered.

Trench 21—4 inches deep yielded 55 pounds.
" 23—4 " " " 47¼ "
" 27—4 " " " 49½ "

Or, estimated by the acre, we have:

Trench	21.	403.33 bushels.
"	23.	348.33 "
"	27.	363.00 "

This gives an average, for four-inch-deep planting, of 371.55 bushels to the acre.

Trench 20—8 inches deep yielded 52½ pounds.
" 22—8 " " " 41 "
" 26—8 " " " 48⅓ "
" 29—8 " " " 42⅛ "

Or, estimated by the acre in bushels of 60 pounds each, we have:

Trench	20	385.00
"	22	300.66
"	26	355.66
"	29	311.66

This gives an average per acre, for eight-inches-deep planting, of 338.24 bushels.

Trench 24—10 inches deep— 36½ pounds.
" 25—10 " " — 52 "
" 28—10 " " — 38¾ "

Or, estimated by the acre, we have:

Trench	24	267.66 bushels.
"	25	381.33 "
"	28	384.16 "

This gives an average per acre, for 10-inch-deep planting, of 311.05 bushels.

SUMMARY.

Ten-inch planting	311.05 bushels.
Eight-inch planting	338.24 "
Four-inch planting	371.55 "

The variety planted was the Rural Blush. Some of the vines were greatly, some slightly and a few not at all injured by the flea-beetle. This experiment will be repeated the coming season. The question involved is important.

DIFFERENCES IN FARM MANURES.

"*Manures from various kinds of animals differ considerably in form and somewhat in composition. Is it wise economy to mix them all together, or should we apply them separately, giving to each crop the manure that seems best adapted to it?*"

FROM PROF. I. P. ROBERTS.

The value of farm manures depends on so many conditions that it is hardly possible to make any accurate comparisons between the value of the excrements of the various kinds of domesticated animals. Still, a discussion of the subject, and of the best methods of preserving and applying them, may be of great benefit. Other things being equal, the following will be found to hold true in most cases.

1. The value of manure is modified by the amount of food given to the animal. Liberally fed animals produce not only more, but better manure than poorly fed ones.

2. Animals fed on foods rich in protein—or nitrogen—and concentrated foods, furnish far more valuable voidings than do those which are fed on straw, roots and the like.

3. Animals giving large amounts of milk produce poorer manure than any others of their kind, except animals from one to four weeks old.

4. Animals fed so sparingly that they neither increase in weight nor produce anything but manure, return to the manure heap *all* of the fertilizing elements which were contained in the food consumed, but the quantity is always very small.

The following table gives a fair average of the percentage of the manurial elements of the foods consumed, found in the voidings of the classes of animals named below:

Calves—1 to 4 weeks old,	20	per cent.
Milch cows,	80	" "
Growing animals—1 to 3 years,	90	" "
Fattening animals—mature,	95	" "
Mature animals—not gaining, or producing,	100	"

The following table gives approximately the weight of solid and liquid voidings, for one year, of the animals named, according to Morton's Cyclopedia.

	Solids	Liquid	Tons
Horse,	12,000	3,000	7.50
Cow, some succulent food,	20,000	8,000	14.00
Sheep,	760	380	0.57
Hog,	1,800	1,200	1.50

At the Cornell University Experiment Station three cows, weighing 3,570 pounds, ate in three days 122 pounds of clover hay, 41 pounds of corn-stalks, 45 pounds of cotton-seed-meal, 42 pounds of corn-meal and 42 pounds of malt sprouts. The yield of milk was 285 pounds, or an average of 31⅝ pounds per cow per day, and the product of manure for each cow per day was 89 1-9 pounds, and each drank 83⅓ pounds of water. The foods were analyzed and the manure valued, according to the first table given above, and it was found that each cow produced manure worth 16 7-9 cents per day. The mixed manure of the classes of animals named above, weighs about twice as much as the air-dried food fed to them.

The value of manure computed at commercial prices for nitrogen, potash and phosphoric acid, is equal to, or exceeds one-half the cost of the food used. Manure from corn-fed pigs is an exception to this rule. The urine of herbivorous animals is rich in substances which tend to develop the stem and leaf, and deficient in those which produce seeds, hence it is often used to force plants in the early stages of their growth. Solid excrements are comparatively rich in humus and seed-forming principles and deficient in power to produce leaves and stems. Happily liquid droppings decompose much more rapidly than the solid, so if we are wise enough to apply the liquids and solids together, the plant will receive just the kind of nourishment it wants both in its earlier and later stages of development. To show the great loss of manure when not properly cared for, I quote the following from experiments conducted in Europe—

Five tons of fresh manure contained

	40	pounds of	nitrogen.
When half rotted,	35	"	"
In cheesy state,	25	"	"
Fully decomposed	20	"	"

While the nitrogen had been reduced one-half, the total weight of the manure had been reduced still more, so unless proper care is taken in the rotting of manure, it will be better to apply it direct from the stable. Few barns are yet so arranged that the manures from the various animals are economically mixed as the stables are cleaned out; but where it can be done at slight expense it should be done, for it will be found that both the drier manures and damper ones will be much improved in character, and danger from loss will be greatly diminished.

The question often arises where will sheep, or hog, or cow manure do the most good and the least harm. Fresh sheep, horse and pig manures would best be applied to grass lands in early fall, and those intended for corn, in the following spring. Cow manure would best be applied to ground intended for roots, as they love a moist, cool soil, while corn thrives best in one that is warm and dryish. There is less danger of "fingers and toes" and "scab" if cow manure, instead of horse manure, is used, though it is always safest to apply only well rotted manure in late fall or early spring, to ground intended for roots and tubers.

Hen manure does not differ materially from other manures in quantity per 1,000 pounds live weight of animal, if its dryness is considered and the foods used are of the same character as those fed to the other animals, or, in other words, the animal has no power to *create* plant food. The real value of manure is equal to the manural value of the food used, *minus* what the animal has taken out for its own use. Corn-fed hens laying eggs produce *poor* manure. The reason why hen manure is richer than other kinds is that the animal needs and uses large quantities of nitrogenous food and small quantities of water.

The best results may be expected from the application of well rotted manure to wheat and grass lands in September and October. In order to prevent waste and improve the chemical and mechanical condition of the manure, it should be rotted and preserved in a water-tight receptacle with an outlet at the lowest point so that the leachings may flow into a small cistern. The liquid manure should be pumped back upon the heap and a little gypsum or earth should be spread over the mass.

I am pleased to know that you have taken this valuable advance step in the discussion of manures and that you are trying to teach true agriculture, which consists in taking from the soil such concentrated elements of life as the world wants and replacing them in the crude, cheap and waste products so skillfully that no serious diminution of fertility will occur.

Ithaca, N. Y.

FROM W. L. DEVEREAUX.

To secure the best results by applying each sort of manure to the crop for which its mechanical condition best fits it, I incline to the use of sheep manure for wheat and Timothy meadow and as a surface application. In sheep-pens it becomes trodden down into very compact layers and is much subject to heating and fire-fang, and in that condition it is unsuited for the above use, so that it is essential that it should be carted out to the yard to be dampened and pitched over. It will be still better, however, if it is piled under shelter, made damp, and gypsum is applied. In this way it is made fine enough to be fit for spreading properly over a wide reach of surface, and in this form of a top-dressing it will be extraordinarily effective even when not distributed in a thick coat. I am not familiar with the practice of applying sheep manure directly to the land from the sheep-house in winter and spring; but I know that it will do great things for the fertility of the land whenever or however it may be applied.

I regard sheep manure as the best of all farm manures, especially if the sheep's ration consisted largely of clover hay, which makes manure twice as valuable as that from sheep fed on straw, potatoes and bran, and very much better than that from sheep fed on common meadow hay.

Cow manure mixed with barn-yard manure consisting of rotted straw and stalks, is, in my practice, used for various crops. I often use it plowed in, for wheat, and to some extent, it is drawn out to the fields in winter for spring crops.

Horse manure is suited for top-dressing in tillage for wheat, and it is valuable, when drawn to the land in winter, for bringing up poor places to the standard of a field under oats, barley or corn, and it is equally valuable for doubling the fertility of land devoted to garden crops. It has given me good results when put in trenches over potatoes, ashes being added, and all receiving at once a slight covering of soil.

For hoed crops and fertilizing in the hill, hog manure is very effective. It is the backbone of success with cabbages, melons, squashes, etc.

Having expected much of poultry manure, and, withal, having received small returns, I regard it as a puzzler. I have used it in the hill for corn, and in compost as a top-dressing for wheat. I have also used it in the drill and sown it with oats, barley and wheat without getting any noticeable returns. I have now a section in a field of wheat where it was sown by a fertilizer drill opened to its full capacity. The hen manure in this trial was mixed with well weathered muck, and on a portion ashes was also added to the mixture in the drill, just as it started up each time, so that it might be quickly buried in the soil very soon after mixing. There has been no sign of fertility about that section of wheat yet.

FROM H. M. ENGLE.

Manure even from the same animal varies much according to the food given it, and this fact makes the word manure rather indefinite. Animals fed rather sparingly on ordinary hay or corn-fodder and corn chop, if a large quantity of litter is used for absorbents, will make a very ordinary manure, especially if it is left exposed to the weather too long; while animals which, in addition to good hay and corn, are fed full rations of shorts, linseed or cotton-seed-meal, or all of these, in proper proportions, if there is only a moderate quantity of absorbents, will make a manure which will be more than twice the value of the former, and the two sorts will show different effects on different crops because the ingredients in them are differently proportioned.

The droppings of fowls fed largely on wheat and oats will show a better analysis than those from birds fed on corn only. The general custom among farmers is to mix all the manures in one heap. The mixture is then more nearly a well proportioned complete fertilizer than the manure from animals of any one kind.

As to unmixed manures, that from the horse has given me better results in sweet potatoes than that which has been mixed, or that from any other animal, while that from the hog has given the poorest, the latter causing a luxuriant growth of vines, but few fair tubers.

For celery I find no manure superior, if there is any equal to that from fowls, and it does not fail to show good results when applied to almost any other crop. Were I confined to one kind of manure, that from fowl would be my choice. That from sheep I consider next in value.

NIGHT SOIL AS A FARM MANURE.

A. HOLLAND.

"*How, when and where collected? How stored, preserved or handled? How applied to the soil, and in what quantities? What crops is it best for? How does it rank in value as compared with barn-yard manure?*"

THE above questions I am asked by the RURAL to answer according to the experience I have had in using night soil as a fertilizer.

COLLECTION OF NIGHT-SOIL.

The collection of night-soil in the city of Ottawa, Canada, is done by contract, under supervision of a health officer appointed by the Board of Health. The contractor furnishes men, teams and appliances for the work, and his services are paid for by the owner or tenant whose privy vault is emptied by him. My farm comprising 190 acres being only 2½ miles from the city limits, was offered as a dumping-ground, the city authorities having found considerable difficulty in securing a convenient place for this purpose owing to local prejudice against the use of such a fertilizer. For many years the city night-soil had been carted out on the ice on the Ottawa River, whence it was carried off by the spring floods, until finally the act against the pollution of rivers and streams was put in force and the practice was stopped.

HOW STORED PRESERVED OR HANDLED.

The night-soil is now collected in barrels made for the purpose with close covers, and is sent out to my farm at the rate of about ten tons per day. Last winter I made the teamsters dump their loads as evenly as possible on a field of black clay loam, deeply plowed in the fall. As the process went on and 14 acres of ground (across the middle of which a small creek runs) became covered with night-soil, an outcry was raised by the neighbors that it would poison the water supply of the city when the spring floods came. In vain did I urge that those piles would be frozen as hard as a rock until the flood was over: I had (to save myself from legal proceedings) to cover each load of night-soil with stable manure and gas-lime, so that on that piece of ground I am unable to say what proportion of the heavy crop of corn I raised was due to the night-soil and what to the gas-lime and stable manure. I may add that my expectations were realized as to the spring flood; long after the snow had melted and disappeared the piles of night-soil were frozen so hard that we could not spread them, and under each pile was to be found the layer of snow and frozen soil on which it was deposited, while the surrounding soil was thawed out. The remainder of the 10,000 barrels of night-soil drawn to my fields last winter I composted in two large piles with stable manure drawn from the city, and gas-lime. As I distributed

BROWNELL'S WINNER POTATO. From Nature. Fig. 33.

those heaps only last fall, I shall not be able to record the results until next season.

IN WHAT QUANTITIES APPLIED?

It is very difficult to give a satisfactory answer to this question. In our cold climate the privy vaults freeze in the winter and the contents have to be chopped out. As housemaids are in the habit of throwing all kinds of refuse into the cess-pits, the proportion of valuable fertilizer to broken glass, crockery, old boots, tin cans, slops, etc., is very hard to estimate correctly. Frequently loads of 30,000 pounds contain at least nine-tenths of ice and refuse. Last winter we applied about 40 loads per acre.

WHAT CROPS IS IT BEST FOR?

Thus far I have found it to give the best results in mangolds and corn. In one field where the night-soil was applied at the rate of at least 20 tons to the acre of a rich sandy-loam soil with a clay sub-soil, with an equal amount of stable manure, muck and gas-lime, I found that the excess of what I presume to be nitrogen (I am no scientist) had in some places destroyed the vitality of the seeds. Those which did germinate threw up a sickly-looking lot of plants (carrots, parsnips and turnips) which seemed to have a hard struggle for an existence in the extremely dry season that followed. When the rainy weather set in at the end of August, however, the transformation was marvelous. I never saw such a growth in so short a time. Many of the carrots and parsnips dug from the field were six inches in diameter, and a large proportion had split open from the rapidity of growth. Cabbages in the same field had also burst to such a degree that they could not be marketed, and had to be fed to hogs and young cattle.

COMPARISON WITH BARN-YARD MANURE.

I can hardly give an estimate of the practical value of night-soil as compared with barn-yard manure.

The night-soil seems to be more soluble and more readily available as plant food than stable manure, and composted with black muck I think it is more valuable for roots and vegetables. But there are so many objectionable features connected with the use of it—the difficulty of getting men to handle it; the prejudice in the market against buying vegetables raised by such means, and, worse than all, the danger to horses' feet from the quantity of broken bottles worked up in the soil—that I would much rather haul stable manure from the city with my own teams, if I could get it as cheap, than use night-soil. I have an idea that by building a large water-tight tank into which to dump the night-soil mixing with it as much ground apatite (phosphate of lime), and as much as it would absorb, the ammonia generated would create such a chemical change in the pulverized rock as to make the phosphoric acid available as plant food. Ground apatite containing 60 per cent. of lime phosphate, is sold at the mills in this vicinity at $8 per ton. I have used a quantity of it this winter in the stables as an absorbent, scattering it in the gutters behind the cows. Next season I shall be able to judge of its effects on vegetation. In conclusion, I may say that I am now having a twelve-acre field covered with night-soil as it comes from the city. The soil is a somewhat sharp, sandy loam, summer-fallowed last season for the purpose of getting a large quantity of boulders out of it. The field is deeply plowed, and I expect that with two men, six horses and a steel rail 30 feet long, I shall be able to spread the manure evenly and thoroughly in less than a day. I propose to plant the field with potatoes, using an Aspinwall planter for that purpose, and in due time I shall inform the readers of the RURAL of the result.

MAINTAINING FERTILITY AT THE WEST.

IN the RURAL for January 5, a correspondent writing from Athens Co., Ohio, deplored the evident depreciation in the fertility of Western soils. In closing his note he made use of the following words:

"*The question here arises: Can this fertility ever be returned to the soil by the use of commercial fertilizers? I answer, yes, but it will force the owner to mortgage his farm. Not only will he have to mortgage it, but the sheriff will foreclose the mortgage and some one else will have a rich farm.*"

The question thus raised is a most interesting one for Western farmers to consider. Here are a few of the remarks called out by this statement.

FROM PROF. F. H. STORER.

It is not easy for any one unacquainted with the soil of the locality to speak on the question here propounded. It may well be true that new methods of cropping are needed much more than artificial fertilizers. Has everything been done there with clover that can be done? Has it been proved that there are no profitable "preparatory crops" fit to precede grass and insure its catching? It is not unlikely that the good success with Timothy which the writer says he had in former years may have depended on better tilth in those days and a greater capacity of the land to absorb and hold water than it has now. Has he ever tried, on his land, Orchard grass, sown according to approved methods? Probably there are very few places in this country where phosphates can be used economically for the sake of the grass crop, though there may probably be some situations where a very cheap and fairly good phosphate, such as the "phospbatic slag" of Europe, could be employed with advantage, provided we had ready access to it.

If a farmer condemns the use of chemical fertilizers before he has tried a high grade "complete" article, he merely deceives himself and stands in the light of his own progress.

FROM JUDGE T. C. JONES.

THE conclusions of your Athens, Ohio, correspondent respecting the results that may be expected from the continued use of "commercial fertilizers" for the production of grain crops, are, in the main, correct; but I think he is wrong in concluding that the only way to maintain the capacity of the soil to grow full crops is to continue the use of the fertilizers. I have had no practical experience with lands on the sandstone formations of Eastern Ohio, living on the limestone soils of the Scioto Valley; but, I am quite familiar with the practice of the farmers in the eastern and south-eastern counties, and have never seen or heard of any difficulty in growing full crops of clover on those lands, where a proper rotation of crops has been observed—that is, where clover has been sown before the land was exhausted. And even when, by continuous tillage, the land has been "run down," as it is termed, there has been little difficulty in securing a good growth of clover by the application of the commercial fertilizers of which he speaks. And this I think is the best use that can be made of these fertilizers, or of land-plaster which I have often used with excellent results upon clover. When we once get a good stand of clover we are all right as to the future, if we keep up the proper rotation of crops, and keep a little stock—cattle and sheep—to consume our hay and fodder.

It is impossible to restore the fertility of our exhausted lands by growing Timothy or grasses for meadows. Timothy, instead of restoring the fertility of the soil, will exhaust it if the grass is mown and carried off. I never sow Timothy, or Orchard, or Rye grass without clover, or the clover without some of these grasses. When a crop of clover is grown it is a common practice to cut the second growth for seed, and sometimes after this to graze the land so as to leave it bare through the winter. This is a monstrous practice. When the season is favorable a crop of clover seed is usually very profitable; but I don't like to remove the aftermath in this way. If it is fed off (not too closely) by cattle but little injury results.

Delaware Co., Ohio.

The very best of the novelties in vegetables and farm seeds; the best of the standard varieties. This subject will be treated by our best practical writers in a week or so.

FROM A. C. GLIDDEN.

The question here started will be answered differently in different localities.

Throughout Southern Michigan, and, so far as I am imformed, over the whole State, there is no demand for chemical fertilizers, for the reason that the experiments, so far tried, have failed to show any marked increase in production from their use. My views regarding the use of commercial fertilizers, and their necessity in some cases, are different from those usually expressed. I regard them as a temporary expedient, found necessary to fill out the requirements of a soil made sterile by unwise methods of farming. I believe nature is abundantly qualified to provide all the subtile elements that enter into plant life and growth, if given time to organize her forces within the soil.

I have worked the farm I now own, as boy and man, for 36 years, and I know that its capacity for the production of crops is nearly double what it was at the beginning of this period. There have been seasons like the last two, when droughts have prevented a catch of grass, when the fields seemed to go back in quality. During this period of gradual improvement the chemical affinities have kept pace with the improved character of the soil. Never has there been a handful of chemical fertilizer sown on the farm, and I never expect to see the time when it will become necessary to use it. Fifty years ago there was a log house and a cooper-shop on the farm, where now is the middle of a field. These have been taken down, and the space they occupied has been tilled for nearly 30 years; but around this spot my best crop in the field still grows. The seed takes on a stronger growth, and grass and grain are one-third better there than on the lands adjoining. I think here is a prophecy of what the other parts of the field may become, without the aid of phosphates or any other special fertilizers. On a neighbor's farm there stood a schoolhouse with ample grounds, built and occupied when the whole country was comparatively a wilderness. The grounds about the schoolhouse were never plowed until a new schoolhouse was built in another location. Then they were united to the fields about them, and cultivated like the rest. The ground occupied as the yard back of the school-house, was sterile for years. It was in the same condition regarding fertility, as when the trees were felled. This half acre of yellow, raw soil was in direct contrast to the dark-colored land about it, and it is still behind in fertility, and shows it with every crop.

On a naturally strong soil that has been too frequently cropped, the main elements of fertility may be exhausted and here the application of chemical fertilizers has a complementary effect on the soil as a timely relief. But such expedients should be regarded by the owner of the soil as a reprimand for some neglect or remissness of duty in previous years. Land that has become valuable from its proximity to good markets for its products, may be kept producing for a time by the use of chemical fertilizers by the aid of stable manures, without the necessity of rest; but ordinary farming lands must lie in grass for stated periods of greater or less duration, according to the character and needs of the soil. During these periods of rest, the energies of the soil should be assisted by stimulating manures applied to the surface. The soil thus becomes again perfected and complete in all the requirements for the production of a crop, so that chemical fertilizers of all kinds become superfluous, and unnecessary.

To believe that the soil of the West must eventually need artificial manures, is to concede that there is a gradual and natural decadence of fertility, which carries with it the assumption that the race will eventually die of starvation. The facts warrant no such prophecy. Soils carefully and judiciously farmed, are capable of a steadily increasing fertility, and this in a ratio to correspond with the increasing wants of population. I am no pessimist, as the above will indicate, and it will take a more devastating drought than has yet overspread the earth, to convince me that seed-time and harvest with their concomitant supports, will not continue.

Van Buren Co., Mich.

What among the new kinds of strawberries, raspberries, blackberries, grapes and large fruits are actual improvements upon older varieties? This subject will be fully treated by the best horticultural writers in the country, in a R. N.-Y. special soon to be issued.

FROM PROF. J. W SANBORN.

Your correspondent is right, and right in a ringing way. Waste drops from about every finger of our Western farm policy. Above, horizontally and below waste follows hot on the heels of the plow when too much sped. Another brood of wastes follows the cropping, and as much nutrition is cast to the winds, and the "tooth of time" in corn fodder as is carried off in the corn grown. And then the wasting of straw and the animal heat floating away on every breeze, and the manure that loads every rill in its onward course to the Gulf of Mexico: these make the wastes that would go far to feed some nations. So far as the Mississippi Valley is concerned as a whole, chemicals will raise both the crops and the size of the mortgages. Few have greater faith in chemicals than the writer.

The fact of their competency to grow large crops continuously seems well established by the most competent evidence. The personal experience of my father on a hill farm in New Hampshire for 13 years has shown that chemicals on land very badly worn out will not only continuously raise fair crops but steadily increase the capacity of the soil to produce them. But the question raised is not the adequacy, but the economy of chemical fertilizers. They and yard manure combined are profitable when used in the East, but six years' use of them here has confirmed that which is apparent without trial—that chemicals cannot pay when prices for the staple products of the soil are low. It is true that chemicals will pay here for high-priced crops or that they can be used without loss; or, in more explicit terms, yard manure even then is much the cheaper source of manure. Again, there may be soils deficient in some one essential element of plant food, and if this be the low-priced potash, then it might pay to use it if other materials are abundant in the soils; but these conditions are not the rule.

I should regard it as a very great misfortune to the West to be induced to use chemical manures as yet, and I hope that it will not be advised to do so. I have steadily opposed all movements looking to the use of chemicals in Missouri. My reason is obvious and, I believe, a conclusive one, and goes beyond the mere fact that corn at 25 cents per bushel will not do more than pay the fertilizer bill, no account being taken of the cost of the necessary labor or of the rent of the land. It is a fundamental truth that stock manures are far cheaper; indeed, practically they cost only the outlay for drawing and spreading. We have had tables of manurial values of foods after feeding, going the rounds for years. Whatever may be the theoretical value and accuracy of these, I think it is true that they do not represent the practical value of manures from grain feeds. Interest, leaching, volatilization, unfortunate chemical reactions of yard manure which has to lie in soils that are close, for years before it is fully decomposed, cut down the value below that of each constituent of a chemical fertilizer; other and commercial factors enter into the calculation.

I made for the Mirror and Farmer, a short time since, a table representing the value that I believed the manure from a ton of several sorts of foods would have in practice. The value also represented the rates at which I would actually as soon have the manure from a ton of said foods as to use the same amount of money in chemicals. This table was carefully made, the several factors involved having been weighed. Here is the calculated value in actual practice of the manure made from the various kinds of stock feed:

Corn	$3.27
Corn-fodder	1.25
Clover	3 50
Timothy	2.73
Oats	3.46
Oat-straw	1.27
Wheat-straw	.98
Bran	6.47
Middlings	5.12
Linseed-meal	9.03
Cotton-seed-meal	12 61
Carrots	.45

Now I do not wish to tell my Western readers that they can afford to give the above rates for the West, but I do mean to tell them that they may as well give them as to pay the price prevailing for chemicals, and I believe that the manure trade would be the best. If I am correct, then it needs no further argument to show that it is far cheaper to save the manure now being wasted, and indeed to feed for it rather than to buy chemicals. I regard stock as still our best market for our foods, and if this be so, their manure costs nothing, and chemicals are out of the question.

Columbia, Mo.

If a farmer should buy two tons of fine ground bone and spread it evenly upon an acre of land and the crops thereon should be no better than upon contiguous land, he would not be justified in concluding that his land does not need bone. If the same ineffectual results should follow the use of a ton of sulphate of potash upon another acre, this would not prove that the land does not need potash. Combine the two upon a third acre, and if the land makes no response, the farmer may conclude that, for the present at least, commercial fertilizers don't pay.

Arboricultural.

THE ORIENTAL SPRUCE.

(*See page* 103.)

THE illustration (Fig. 34), engraved from a photograph taken early last spring, shows a specimen of this hardy and beautiful evergreen tree growing in the Rural Experiment Grounds. It was taken from the nursery some 12 years ago, and is now 10 feet high, by about six feet in diameter at the ground. It has never been injured in the slightest degree by cold, heat or drought. A casual observer would mistake it for a young Norway spruce, but an examination shows decided differences and a beauty all its own.

In the language of F. J. Scott "the multiplicity of its twigs gives the tree a superior density of foliage which its early growth does not promise; and when a large tree, its dark-green masses break into strong and irregular

lights and shades, and it is then easily distinguished from the Norway by a greater solidity of character, or, to speak more specifically, by the less distinctly marked separation of its horizontal branches."

Our engraving does not show the undulating character of the branches and leaves of the RURAL'S specimen. The thickly-clothed branches near the base are here and there quite pendulous, while again they extend out beyond a symmetrical line, making the light and shadow well defined. The writer has seen but one specimen of this tree old enough to display its mature habit and that is recognized as one of the finest of the species anywhere to be seen. It is about 30 feet high. It is dense, heavy, dark in color with none of the horizontal, leggy layers of branches which characterize the Norway.

The Oriental Spruce, (Abies orientalis of the catalogues) is a native of the region about the Black Sea, and is said to grow to a hight of 75 feet. It will be seen that the R. N.-Y.'s specimen is of slow growth. Norway spruces set out at the same time are nearly twice the hight. It is thought by some botanists to be the same as Abies (Picea) obovata.

SEEDING TO GRASS: SHEEP.

Subscriber (No Address).—Last spring and summer I heavily manured, with yard manure, two lots for potatoes and cauliflower. Circumstances prevented sowing rye as intended. Previously the potato lot had raised oats and the cauliflower lot was sod, soil a light loam. We need hay. Now, what course shall I pursue to get the most profit? 1. Shall I sow grass seed alone or with barley, oats or spring-wheat? 2. I have also another lot—level—terribly rocky—on which sheep have run a long time. I dislike to use a cultivator on it on account of rocks.

Shall I sow oats, buckwheat, barley, or what course shall I pursue in order to get it in grass again without the use of a cultivator. 3. Can the RURAL tell where to get some thoroughbred sheep at prices somewhat reasonable?

ANSWERED BY JOSEPH HARRIS.

I know of no grass or clover that, sown in the spring, will give a good crop of hay the first year. I happened to have just such a case last year. I had a ten-acre lot of rather low, alluvial, sandy, black soil that had been used for garden and seed-growing for some years. I wished to seed it down. Six acres were sown with Timothy seed in September; the other four acres were in corn and the corn was not off in time to sow the grass seed in the fall. I intended to sow rye and seed down with it in the fall, but press of other work delayed the husking till we thought it too late for rye and grass. I harrowed the corn stubble thoroughly in the fall and the next spring—1888—sowed two bushels of oats per acre on the snow, and a little later sowed a mixture of six quarts of Timothy seed and two quarts of Alsike clover seed per acre. Owing possibly to the unusually dry spring, the oats failed to come up as Col. Curtis and others had given us to understand they would, but the grass and clover came up well. The six acres seeded with Timothy in the fall produced a heavy crop of hay, so heavy that some if it was lodged and rotted a little at the bottom. But we got a crop estimated at three tons of hay per acre. So far as the oats were concerned, our experiment in sowing them on the snow was not a success. In some parts of the lot, wild mustard and other seeds were almost as thick as the oats, and about the first of July we cut them with a mowing machine and made them into hay. But after the oats were cut the grass and clover grew rapidly, and the ground is now covered with a good sod and bids fair to give us a good crop of hay this year. Notwithstanding this failure, I intend to give the plan another trial this spring. It is important to get grass seed in early, and if, as Col. Curtis claims, oats, in ordinary seasons can be sown with advantage on the snow just before warm weather, the plan, when grass is he main object, is well worthy of a trial. As a rule, if seeding is delayed till we can plow the land, barley and spring wheat are better crops to seed with than oats. 2. If the land is so rocky that it cannot be plowed with advantage, he should let it remain in grass and try to bring in much better grasses by sowing 250 or 300 pounds of some high-grade complete fertilizer, selecting the one that will give the most nitrogen, phosphoric acid and potash, at the least cost, giving the preference to the one containing the most nitrogen. Another far cheaper method, but not so rapid, will be to keep sheep on the pasture and give them a pound of cotton-seed-cake each, per day. Sell the sheep when fat and buy and fatten lean ones, and continue feeding cotton-seed-cake. If properly managed, the sheep will pay for the feed, and the manure from the cotton-seed-cake will greatly improve the pasture. If the field has been in grass for many years it will probably not be necessary to sow grass seed, though it could do no harm to sow a little White Clover, Alsike clover, Rye Grass, Orchard Grass, etc. on the land *very early in the spring.* 3. This question is too indefinite. You must first make up your mind what breed of sheep you want—say Merinos for fine wool, or some of the mutton breeds, such as Cotswolds, Leicesters, Lincolns (for combing wool) or Oxford, Shropshire, Hampshire or Sussex Downs. The latter are usually called "South Downs" and are one of the oldest and best of the mutton breeds, especially when the quality of the mutton is the leading object. Unless you wish to be a "breeder" you do not need to pay a high price for thoroughbred ewes. If your object is to keep sheep for mutton and wool and not for selling for breeding purposes, the better plan will probably be to select some of the best common ewes you can find at common prices, and then try a thoroughbred ram. In this way, with the use of plenty of cotton-seed cake, you can soon have a fine flock of what the English farmers term "rent-paying" sheep.

FEED FOR GROWING CATTLE AND MILCH COWS.

J. D. L., Moore's Salt Works, Ohio.—I am wintering 25 head of cattle consisting of yearlings and two-year-old heifers. My coarse feed is cut corn-fodder in the morning, and wheat and oat-straw at night. I aim to cut my grain before it is quite ripe, thinking that then the straw will be better. I also want to cut the corn before frost. All my cattle are in a good, warm stable. I have 1,000 bushels of corn ears and 200 bushels of oats. I crush my corn, and all my feed is ground. At our mills, six miles distant, I can purchase roller-process bran with all the shorts with it, for $1 per cwt., or I can get Chicago bran at the railroad station, the same distance away, at $17 per ton. The latter appears to be nothing but bran. Which is the cheaper, and in what proportion should they be mixed to make a large growth in the young stock, and to make the cows yield a fair quantity of butter? At the station oil-meal is worth $27 per ton; oats, about 40 cents per bushel.

ANSWERED BY HENRY STEWART.

Bran is the best food for the young cattle, beyond question, but it is too dry and fine to be eaten without some waste. Under the circumstances, it would, we think, be advisable to mix some of the crushed corn with it in sufficient quantity to cause the whole to be better masticated; one quart twice a day of a mixture of one part of the crushed corn with three parts of the bran might be given to a yearling. In practice this has been found excellent feeding for all sorts of young animals, including colts. At the price mentioned, bran can be more profitably used in this way than the mixture containing shorts. Roller-process bran is worth about 10 per cent. more for feeding than ordinary bran, because its fat and nitrogen are more valuable in feeding than the starch of the middlings. Starch has a feeding value of one only as compared with 2½ of fat and nitrogen compounds. But for cows fed for butter product, it has been found that corn-meal is the best standard food, and if it were not that a cow cannot so healthfully consume a large quantity of it as she can of a mixture of corn-meal and bran, it would be better to feed all corn-meal. It contains about twice as much fat as bran, and yields a softer butter which is more easily gathered in the churn. The present winter I am feeding cows, alternate months, with all corn-meal—eight pounds daily,—and then with eight pounds of mixed corn-meal and bran. The butter from the whole meal is churned in 20 minutes, and is about one pound more weekly from each cow than from the mixed bran and meal; but the butter from the latter is not so good in quality, is of a lighter color and requires 30 to 40 minutes to churn, which is too long for the best quality. Oil-meal—linseed—yields a soft and inferior-flavored butter; but cotton-seed-meal is not surpassed for the quality and texture of the butter made from it. It is so rich a food, however, containing 13 to 18 per cent. of fat and more than 40 per cent. of nitrogen compounds, that two pounds daily are as much as can be used without danger to the cow. One of the cows I am now feeding cannot take cotton-seed-meal at all without being sick and refusing food for two or three days, and cannot take eight pounds of clear corn-meal daily without the same result. This experience with cows is so common with dairymen that it is wise to test each cow in regard to the feeding, and as a rule it is safe to use a portion of bran in the feed rather than clear meal. All rules for feeding are modified more or less by the character of the cows in this respect.

INCREASING FERTILITY BY MEANS OF CHEMICAL FERTILIZERS.

F. C., Ironville, Ohio.—On page 53 of this year's RURAL, D. C. L. tells us that he owns a farm of 100 acres, of which he cultivates 90, increasing its fertility by the use of high-grade commercial fertilizers. I, for one, would like to hear more from him about the subject.

ANSWERED BY D. C. LEWIS, MIDDLESEX CO., NEW JERSEY.

It is 12 years since I first commenced the use of chemical fertilizers. Previous to that time I practiced rotation as follows: Sward for corn; oats and potatoes on corn stubble. My yard manure was broadcasted on the oat stubble for wheat with about 150 to 200 pounds of Peruvian guano per acre. I seeded down to grass with wheat. Then I pastured or mowed the land for two years, making a five-year rotation. At that time I depended on an application of 100 bushels of sand marl per acre to make the grass crop. I also purchased all the stable manure I could get about the village at $2 per load. I commenced the use of chemical fertilizers in moderate quantities, with yard manure, on wheat and potatoes only. In recent years I have changed my system of treatment, but I continue the five-year rotation of crops. I am now applying all my yard manure to the corn crop, in July, for next year's crop depending upon chemical fertilizers alone for potatoes, wheat and grass, using a special corn fertilizer on sward for corn since I sometimes run short of yard manure. When I commenced the use of chemical fertilizers on wheat, I applied about 300 pounds per acre; but I have increased the application to 700 pounds, which has doubled the yield of wheat per acre, as compared with the outcome from the old system. It has also largely increased the yield of grass per acre, so that my gross receipts from the farm have increased, over the yield under the old system, to an average of $1,000 per annum. And it appears to me that I have just learned how to use the chemical fertilizers with profit. I am now applying 1,200 pounds of Mapes potato fertilizer per acre, for potatoes, and as wheat follows potatoes, I apply about 300 pounds per acre for the wheat, making 1,500 pounds of purchased fertilizers per acre, for the potatoes. It appears to me that I may apply even 1,800 pounds, to 2,000 pounds per acre for the five-year rotation as the quantity that can be most profitably used. My present system of rotation is corn, potatoes, wheat, and grass two years. I have never used any of the ordinary superphosphates on wheat or when seeding to grass. I have always used fertilizers of the highest grade I could buy and my faith is very strong that mine is the only safe system for permanent improvement.

PROPORTION OF BUTTER IN MILK AS AFFECTED BY FEED.

E. L. B., Groton City, N. Y.—Will Col. Curtis tell us whether it takes more milk to make a pound of butter when the cows are fed on grass than when they are fed on hay or silage? It is a common opinion that more butter can be made from a given quantity of milk in the fall than in the summer, with shallow setting. How about deep setting?

ANSWERED BY COL. F. D. CURTIS.

It does not take as much milk to make a pound of butter when the cows are fed on hay, as it does when they are fed on grass, provided the hay was green when cut and was well cured and is of good quality. A cow would make more butter from less milk when fed on green, well cured clover hay, than from clover pasture from which she would make more milk. The butter is the product of the butter fats in the milk. The value of milk is in its solids and not in the amount of water. Rich, dry foods will make more solids in proportion to the water in the milk, and grass will increase the volume of milk and the amount of water in proportion to the solids. The kinds of hay and grass must all be taken into the account. When fed on good silage, cows will give more milk and make more butter than when fed all hay. The rule for feeding is, two pounds of dry fodder for every 100 pounds of live weight. As silage is full of moisture, two pounds more must be added, making 40 pounds a ration for a cow of 1,000 pounds weight. I am sure 40 pounds of good silage will make more and better butter than 20 pounds of any ordinary hay. Neither of these is a full or complete ration. They are only suitable as a maintenance or support ration. To get the best results from either hay or silage, there should be fed with them a portion of bran and either linseed or cotton-seed meal to make a better proportion of the nitrogenous and the carbonaceous foods or elements, so as to obtain a better digestion and assimilation and a better quality of butter and more of it. More butter should be made from a given quantity of milk in the autumn, when set anyway so as to get the cream all up. The cream does not rise as freely in the autumn, on account of its viscosity, or the thick, sticky condition of the milk. By putting in water heated up to 100 degrees, the cream will rise sooner and with more freedom; that is, there will be more of it.

ENLARGEMENT ON HORSE'S LEG.

W. K. L., Ovid Centre, N. Y.—My two-year-old colt has a peculiar enlargement in the inside of the hock joint. It begins abruptly about two inches below the wart or callosity on the posterior part of leg, immediately bears towards the inside of the leg. It goes up in the direction of the "wart," passes behind it, then upwards until it ends in a dome-like enlargement just in front of the point of the hock. It is elastic, and evidently contains some fluid. It began last June and is probably the result of a strain. There have never been any signs of inflammation in it and it has never made the colt lame in the slightest degree. He plays and frolics, walks or trots without favoring the affected leg in the least. I believe it to be an exudation into the sheath of a tendon which has its origin just at the point where the enlargement begins. It has been repeatedly and thoroughly blistered and fired (not with points but with "feather-edge"). It is slowly enlarging. The colt is so valuable that I am willing to incur almost any risk to have the blemish removed. How would it do to lay open the sheath of the tendon from the bottom to the top? Of course, as the fluid is emitted, the enlargement will go down. Then by making an application of a slightly escharotic nature to the inside of sac or sheath produce, as it heals, adhesion and obliteration of the sheath.

ANS. We would advise first trying the following treatment before opening into the cavity. Draw off the contents, if liquid, with an aspirator or a hypodermic syringe. Then inject a solution of the compound tincture of iodine. After a few minutes withdraw this solution and apply a wet bandage so as to compress the sac and bring the walls together. If this fails, then your proposed method of opening the sac is probably the best course to pursue. The seton if properly inserted would undoubtedly serve the same purpose.

SPOILED SILAGE.

J. D. L., Lamington, N. J.—Last summer I built a silo in a bent in the corner of my barn and lined it with oak boards and the inside with matched hemlock. The floor was two feet from the ground. I filled it with green corn without running it through a cutter. When I went to get my silage, it was all spoiled. It was covered with planks and on the top of them I had about a ton of rye straw. If I had run the corn through a cutter or if the bottom was on the ground, would the silage have kept better?

ANSWERED BY PROF. A. J. COOK.

As silage that has been put into silos whole, has come out in fine condition; it is clear either that the silo of J. D. L. is faulty or else that the corn was not put in well. It is not stated whether the silo was lined with paper. Wood alone, however well matched, would not make an air-tight silo. The right way to make a silo is to make a doubled-walled one, both walls to be lined with tarred paper inside the boards, to make it air-and-water-tight. I have had no experience with filling without cutting; but I suppose it very important to tread very thoroughly and lay in the corn very straight so that it can be compressed so as to shut out the air. The air must be excluded. My silo is built as above, and then lined with a coat of plaster with cement used for the lime just as we plaster an underground cistern. I cut all my corn, tread it down very thoroughly about the sides and corners, and cover it with straw held down by boards. My silage comes out perfectly preserved, and is relished to perfection by all stock—horses, cattle, and sheep.

ABOUT MELON CULTURE.

F. G. B., Gratiot, Wis.—My soil is a rich clay loam, and I want to raise enough melons for home use. How should the ground be prepared? Would an application of sand be beneficial and how much should be applied per square rod? What varieties should I plant?

ANSWERED BY J. S. HARRIS.

The opinion generally prevailing is that a sandy or light sandy loam soil is essential for successful melon culture. I have found the melon a plant not at all particular as to soil if it be not too wet and heavy. F. G. B. may prepare his soil for good melon crops by first giving it under-drainage unless the sub-soil is open and porous; next by plowing deep and fine, and if the surface is a dead level, he should leave it in ridges eight or ten feet wide The application of wood ashes—one bushel to a square rod—thoroughly harrowed in, or double the quantity plowed in, has a tendency to keep the soil mellow, and is a good fertilizer. If manures are required, that made from the horse-stable is the best for such a soil. The application of sand does not usually show any immediate benefit. Probably a good load of sharp sand to the rod for four or five years, if thoroughly incorporated with the soil, would in the end prove advantageous; but if all were applied at once it would prove injurious. Varieties: musk-melons, Emerald Gem, Surprise, Early Hackensack; water-melons, Kolb's Gem and Gipsy. Mountain Sprout and Black Spanish are also good varieties. Home-grown seed does not seem to be as sure as that grown South and East.

ABSORBENTS OF LIQUID MANURE.

E. A. P., Chatham, Pa.—What is the best absorbent to use in a barnyard for preserving the liquid manure?

ANS.—The "best" absorbent for liquid manures is the one calculated to add most to the value of the manure, and would evidently be one containing a fair amount of phosphoric acid. Urine is weak in phosphoric acid, that is to say, the amount of phosphoric acid in urine does not bear a fair ratio to the amount of nitrogen or potash. For example, a standard fertilizer contains six per cent. of ammonia, seven per cent. of phosphoric acid and six per cent. of potash. The urine contains such a small percentage of phosphoric acid that it cannot possibly be called a "complete" or standard manure. For use in the gutters behind cattle or horses, sawdust with which a quantity of "floats" or bone meal has been mixed, has been frequently praised. The "floats" alone have but little retentive power—they would be of but little value as an absorbent. An acid phosphate would be better than the "floats." Many farmers make a practice of wheeling the horse manure back of the cows every day. This is considered an economical practice. Stalks and straw cut into inch lengths make an excellent absorbent. These absorbents are best suited for use in the stable where most of the urine should be saved. For the barn-yard, muck, dry earth, sods, straw, leaves, etc., etc., will save much of the liquid.

ABOUT POTATO CULTURE.

J. I. B. Jr., Riverdale, N. Y.—I am thinking of trying the Rural Trench System of raising potatoes. 1. Of the Burbank, White Elephant and Late Beauty of Hebron, which would be the best; that is, the most profitable to raise? 2. What are the merits and demerits of each? 3. Have your experiments demonstrated how the seed of these varieties should be cut to the best advantage? 4. Where can seed be obtained? 5. How can trenches, etc., be satisfactorily made in a field of plowed sod?

ANS.—1. The White Elephant and Late Beauty of Hebron are essentially the same. At any rate, the R. N.-Y. can see no difference. The quality is better than that of Burbank. 2. Burbank is a good yielder. The shape of the White Elephant might be better. 3. Take medium-sized potatoes, cut off the seed-end and cut the rest so as to give two or three strong eyes to each piece and as much flesh to each as possible. 4. See catalogue notices. 5. The sod should have been turned last fall. Then a shovel plow would answer to form the trenches next spring.

SMALL FRUIT QUERIES.

F. S. W., Des Moines, Iowa.—1. What does the RURAL think of the Worden and Moore's Early grapes as compared with the Concord in hardiness, earliness and quality. 2. Is the Niagara hardy enough for our climate and how is it as to quality and productiveness? 3. Are grape vines and strawberry plants raised in nurseries in Northern Ohio and New York as good for planting here as home-grown sorts?

ANS.—1. In our soil the Worden is neither better nor earlier than the Concord, while the bunches do not average so large. Moore's Early is as good as the Concord—10 days earlier. The berries are larger, the bunch smaller. It is fully as hardy. 2. We do not think the Niagara as hardy as the Concord, and we doubt if it will stand your climate. It is very productive. In quality it is no better than the Concord and is more foxy. 3. Yes, in our opinion.

TOP-DRESSING FOR PASTURES; THE HORSE-NETTLE.

E. A. P., Chatham, Pa.—1. What fertilizer would be advisable as a spring top-dressing for pastures that were eaten off close last fall? 2. What is the best way to get rid of the horse-nettle?

ANS. 1. Unleached ashes and raw-bone flour. 2. This pernicious weed (Solanum Carolinense) is a native of the South, but is extending North. The root is perennial, the stem from one to two feet high; the flower bluish-white, berries a quarter-inch in diameter. It should be fought by continuous cultivation until the last plant is killed.

COLD-STORAGE HOUSES.

E. H. C., Highlands, N. J.—Where can I get information concerning cold-storage houses? Is it possible to keep strawberries and like fruits, green corn or other vegetables in a natural state for Christmas in a cold-storage house?

ANS.—R. J. Dean & Co., of this city conduct several large cold-storage houses. A visit to their establishments would be worth more to the observing man than a volume of information. There are other houses along the Hudson River that might be examined with profit. The plan of supplying fruits and vegetables at Christmas is certainly well worth testing.

PARSNIP-FLAVORED CELERY.

M. T. W., Sandy Hill, N. Y.—Last season I had some celery that was so strongly flavored by a parsnip taste that it was nauseating and worthless. Parsnips were growing near it; is it possible they "mixed." As they are of different genera, I can't understand how one can cross-fertilize the other.

ANS. That the celery should be parsnip-flavored is wholly inexplicable to the R. N.-Y.

Miscellaneous.

J. E. R. P., Hornellsville, N. Y.—The barley sent for name is the Nepaul variety.

W. Medina, N. Y.—What is the quality of the Queen of the Valley potato?

ANS.—We consider the quality, as the variety is grown in most places, inferior.

T. W. L., Buckingham Co., Va.—We published a special number of the RURAL devoted exclusively to ensilage last year. In this number the plan of packing whole corn stalks in the silo was described.

J. C., Hartfield, N. Y.—What shall I do for lice on cattle?

ANS.—Pyrethrum dusted into the hair will kill the lice; so will the use of tobacco water, lard and snuff, or thymo-cresol.

G. K. H., Plainfield, N. J.—Please name the best three plums for market in this section.

ANS.—Select from the following: Duane's Purple, Imperial Gage, Jefferson, McLaughlin, Washington.

H. A. D., Taylorville, Ill.—If a young mulberry tree is set out next spring—in April—would it be advisable to mulch it with straw?

ANS.—Should the season be dry, the mulch will be of service; otherwise not in the R. N.-Y.'s opinion.

G. W. S., Parisville, N. Y.—What is the address of some Guernsey cattle breeder in this part of the State?

ANS.—E. N. Howell, Poughkeepsie, N. Y.; J. L. Hope, "Ellerslie," Rhinecliff, N. Y.; S. B. Faber Willets, Roslyn, L. I., N. Y.

F. W. J., Pontiac, Mich.—Where can I get the Thomas smoothing harrow? Who sells the R. N.-Y. No. 2 potato?

ANS.—1. The Herendeen Manufacturing Co., Geneva, N. Y. make the Thomas harrow 2. Thorburn & Co., 15 John St., N.Y. will sell any quantity of the RURAL No. 2 potato as long as their stock holds out.

S. H. S., South Livermore, Me.—Near here there formerly grew some Black-Heart cherry trees, from which there are now some sprouts or young trees growing quite thriftily; but they never bear. Why?

ANS.—The young trees are seedlings probably, and may be very late in bearing.

H. D, Greenwich, Conn.—1. Is the Kittatinny Blackberry hardy in this locality 2. Is it a good bearer and a good market berry?

ANS.—1. A perfectly hardy blackberry for your climate is yet to be found. The Kittatinny often winter-kills here and further south. 2. Yes, a fine bearer of excellent berries and a good market variety.

G. K. H., Penfield, N. Y.—My land is limestone loam, and most of the stones are fast, and many tools that will work well on clear land I cannot use at all. Does the RURAL know of any cultivators that answer the following description?—A cultivator on wheels, with teeth supplied with springs, like the hoes on what is known as a "spring-hoe" drill, so that when a tooth strikes an obstruction it may draw back to a horizontal position without anything breaking, and when the obstruction is passed, it will at once spring back to its former position. The teeth should be arranged so that one or two of the center ones may be removed for cultivating drilled crops two rows at a time.

ANS.—A cultivator made by Hench & Dromgold, of York, Pa., will fill the bill.

DISCUSSION.

THE HELP QUESTION.

F. D., TRENTON, N. J.—A late RURAL is devoted in part to the labor or "help" question. It is one that will be always with us. Before all the fortunes that have been made and under all that may yet be secured, is work. Among the questions sent out in the annual circular by the executive committee of the New Jersey State Board of Agriculture, are these:

1. What are the wages paid adult farm hands per month, with board?
2. What without board?
3. Do farmers generally board their help?
4. Are there more single than married men employed on farms?
5. Are farm laborers native or foreign—*i. e.*, which class is in the majority?

The replies state that the average pay per month, with board, including bed, light, etc., is $12 to $18; without board but usually with a tenant house, garden, and sometimes a quart of milk a day or the keep of a cow and other items, $22 to $25. Farmers generally board their help, however. There are far more single than married men employed as farm hands, and this seems to stand in the way of help boarding themselves, tenant house or no tenant house. I agree in general with Mrs. I. D. C—'s statement on page 57. As a remedy for the large amount of inexperienced, inefficient, ignorant, careless, slipshod, stock-abusing and employer-and-wife-provoking help, we must—or we had better at least—give a higher price for a good, reliable, decent man, who is sufficiently competent to set himself to work occasionally without orders for every step. Only in this way will we grade up farm help, and show the large class who expect good wages on the farm without a knowledge of first principles even, that it will pay them to learn their trade thoroughly, so as to know how to assume responsibility, before they expect a journeyman's or skilled workman's wages. On this point Mr. March is right; so also is Mr. Cook's second paragraph on page 52. I am somewhat surprised, too, to find in answer to question 6, put by the New Jersey Board of Agriculture, that farm laborers are quite generally native; but one county, possibly two, in this State say that foreigners are in the majority.

JAPANESE BUCKWHEAT.

A. J. COOK, INGHAM CO., MICH.—I wish to add my voice to the praise of this excellent grain. I had to pay $3 for seed, which I did with some reluctance; but I am very glad that I did so. 1. The yield was extraordinary—far beyond my highest hopes—and that notwithstanding the fact that it was sown, in part on a very hard, poor soil. 2. The kernels are very large. I never saw such large grain before, though I have raised the common and Silver-hull kinds for some years. 3. I sowed one-half early in June, and the remainder a month later, and the early sown was as good as the other. This, of course, might not always be so. The season was cool and dry. 4. The grain weighs 45 pounds to the measured bushel. 5. The miller tells me he never ground buckwheat that turned out so much flour and so little waste. I should expect this from the size of the berry. 6. We are now eating buck-wheat-cakes from this grain, and we all agree that there is no discount on the Japanese variety for griddle-cakes. 7. I noticed that the bees worked on the blossoms all day; though not so numerously perhaps in the afternoon as in the forenoon: but to a considerable extent. It is the common opinion among bee-keepers that bees never gather from common buckwheat in the afternoon. We know that all plants that bees work on are made more productive if the bees visit the flowers freely. It may be that this very fact is one factor in the greater productiveness of this valuable variety. I am so pleased with it that I shall raise three times as much another year.

SHORT-HORNS VS. DRAFT HORSES.

G. H. C., TALMAGE, KAN.—I have read several articles lately in the RURAL about raising draft horses. The writers figure out quite a handsome profit—a good deal more than I think experience warrants. Farmers here have been breeding grade draft horses for some years, and the oldest are ready to sell out; but it shakes a man's faith in the business to be offered from $100 to $125 for the best, considering the service fee, the risk of accident from barbed-wire fences and the fact that about one-half the colts never get large enough for this trade, and a horse must be five years old or more and be thoroughly broken. I think most farmers will make more money by keeping good Short-horn cows, making good butter and the best of beef.

ANGEL OF MIDNIGHT AND "POND" CORN.

E. S. L., HOLMEN, WIS.—I planted a field with these two sorts on the same day, and, this fall, husked 140 average hills of each. I dried the corn near a stove as dry as could be. The yields of both kinds were shelled and weighed at the same time, and the result was that the Pond corn out-yielded the Midnight 14½ pounds of shelled corn. But the cobs of the Midnight corn are lighter, in proportion to the grain, than those of the Pond. Both kinds are liked here, where replanting in spring is often done two or three times ere a fair stand is secured. Oddly enough, I grow my own seed and never need to replant.

TAXES ON MORTGAGES.

P. C. L., ELKLAND, PA.—I wish to commend the article Taxes on Mortgages in the RURAL of January 12, page 24. It is as true as gospel and should convince all who read it. The tax on mortgages in Pennsylvania is only three mills; but it increases the farmers' interest from three mills to one per cent. Mortgages and notes have been in use for years in which the borrower agrees to pay the tax on the loan, with the interest.

A BEGINNER, TIOGA CO., PA.—In a recent "Discussion" a writer speaks of using a one-horse plow in root-pruning corn to hasten its maturity. I should hesitate much before practicing this system because my brother by so doing lost a valuable crop of Stowell's Evergreen. It was just silking when he went through it, and it stopped maturing ears, and stopped growing in hight. The stalks increased in size so that some of them were immense. Perhaps he doctored it too soon. The theory may be good: the practice failed. Why?

R. N.-Y.—Both theory and practice are bad in our opinion. There may be instances, possibly, when the plants have made an immense growth of leaves and stalks, when root-pruning (as it is called) would induce a larger yield of grain. This might occur in excessively wet seasons. As a rule, we approve of shallow cultivation, assuming that the corn-plant needs all its roots during every stage of its growth, but more especially when the grain begins to form.

A. L. CROSBY, CATONSVILLE, MD.—I think the RURAL is perfectly right in what it said about ensilage corn. Corn for the silo should be, as the RURAL says, short-jointed and not very tall. The tall stalks don't carry the most or widest blades by any means. I mean to try the Rural Thoroughbred Flint corn this season and see if it is not just the thing for ensilage. If it matures too early for Southern latitudes, it can be planted later and then the cultivation of the silo corn and of the corn for shelling will not come at the same time. The B. and W. corn may give a heavy yield; but the weight is in the stalks more than in the blades. It is harder work to handle such heavy green stuff, and it won't pay to do so unless it is "rich" in proportion to its weight—and I don't believe it is.

E. P. N., NICHOLS, CONN.—I notice in several late RURALS that the parrot insists that farming "don't pay," and in looking over the figures in regard to New Jersey, I think the parrot correct, as according with the table given of value of the crops, less the cost of fertilizer as $28,049,087 less eight per cent. interest on capital invested $11,034 829. Supposing it requires one man to work a $2,000 capital, his wages would be only $122.00 a year. There are many farmers in this section who if they could get eight per cent. on what their farms have cost and $1.00 per day for their wages, would make more money in a year than they now do with their farms. I think that to disprove the parrot's saying a different array of figures will be needed.

H. B., WAKEMAN, OHIO.—On page 53 of the RURAL, I note what is said about devoting a special number to discussing the combination wire picket fence and I would say that not half the farms in the United States, except perhaps in the newer settled portions, would sell for the money that has been laid out in fences on them. I believe that no other question of farm economy is of more vital importance than that of fences.

What Others Say

THE CHEAPEST NITROGEN.—Prof. Jenkins of the Connecticut Experiment Station, says that the wholesale price of nitrogen in blood, azotin and sulphate of ammonia has not been so high since the fall of 1883 as at the present time, and nitrogen in nitrate of soda is higher than it has been for two years and a-half. The nitrogen of blood, azotin and sulphate of ammonia would probably cost to-day at retail in fresh stock not far from 18½ cents per pound. A fall in prices is possible, but hardly to be anticipated,

In view of these facts it is worth while to note that the nitrogen of cotton seed meal and castor pomace is at present *relatively* very cheap. Cotton-seed meal can be bought by the car-load to-day at $26.50 or $27.50 per ton at freight centers, or five tons for, say, $137.50. If carried for four months, add for interest $2.75, making the total cost $140.25. These five tons contain about

678 pounds of nitrogen.
300 pounds of phosphoric acid,
180 pounds of potash.

If we value the phosphoric acid at six cents per pound and the potash at 4½ cents, the nitrogen will cost 16 9 cents per pound in cotton-seed-meal, as against 18 to 18½ cents in blood, azotin and sulphate of ammonia. This comparison he believes is, if anything, rather unfair to the cotton-seed-meal.

If bright fresh meal is bought, stored in a dry place and fed judiciously through the winter, it will be worth a good deal more than the above figures indicate. The prices of fertilizers may decline before spring, no one can certainly tell, but the suggestion above given is worth thinking of.

KEEPING MANURE.—Sometimes an independent thinker will burst in upon us with a statement which affronts the "science" of the past woefully. A few years ago such an audacious voice bluntly affirmed that animal manure is never again so good as when it is dropped. This, in the face of all the elaborate directions for making composts with which farmers have been favored in the agricultural papers, seemed very audacious. Nevertheless, science now backs up this assertion of plain common sense. The careful experiments of Dr. Voelcker, Chemist of the Royal Agricultural Society of England, prove that manure gradually depreciates by keeping, under the very best management, gaining in water, and losing in valuable organic matter which is spent in the fermentation. How, then, must it waste and lose under the ordinary exposure in a yard, subject to excessive heating and washing by rain!

RAGE FOR LOW-PRICED FERTILIZERS.—At the present time, says Prof. Jordan, the most serious drawback (both to manufacturer and consumer) is to be found in the foolish rage for low-priced fertilizers. Ground limestone at $8 per ton, the refuse of salt works at $12 per ton, and dear at 50 cents, raw South Carolina rock (not acidulated) at $8 to $10 per ton, the refuse of alum works at $12 per ton (and in large amounts positively injurious to land and crop), New Jersey shell marl at $10 per ton, with not enough soluble potash to pay the freight, and marl and common lime mixed and sold under misleading names, all find by far too many purchashers, who appear to mistake bulk for quality and with whom low price is synonymous with cheapness. The same farmer, when starting out to purchase a horse, would not look for the lowest-priced one which he could find, but would take the animal which he considered the cheapest for the price asked. Let us apply the same rule to the purchase of fertilizers and it will not lead us astray. We want a given result for the lowest possible outlay, and (provided we get the result needed) the smaller the bulk handled the better, for we thus save both freight and labor.

Other things being equal, Prof. Jordan finds that there is most fraud in the lower-priced and least in the higher-priced fertilizers, which [in most cases] the manufacturers keep up to the former standard. Many of our manufacturers having established the reputation of their standard brands will not reduce them to suit the demand for lower-priced articles, but still keep them up to the same guaranteed analyses. In some cases that might be named, and in more than are suspected, a lower grade has been made by mixing cheap "fillers" with the standard goods, to reduce the price per ton to a point which will satisfy the market demand, but analyses prove that in many cases the purchaser pays dearly for the reduction, and that the profits of the manufacturer are as great per ton on the lower-priced goods. We might instance a case of high-priced fertilizer placed on the market at a price, which, at the time, made it the cheapest source of phosphoric acid offered. Failing to make any sale, the manufacturer mixed two tons of cheap "filler" with each ton of the fertilizer, and, by offering the mixture for one-half the original price, obtained $180 for what he had previously asked but $120 for, and the addition had nothing of value in it.

SHORT STORIES.

FUTILITY OF ANALYSIS OF SOILS.—For a time, Mr. C. V. Mapes remarks in his treatise on "Tobacco Growing," analysis of soils was supposed to open a new era in agriculture, but it is now admitted by all the best authorities that it fails utterly to discriminate between the elements that can be appropriated by crops and those that are for the present generation as valueless as the rocks of flint stones. There are soils, one fertile and the other nearly barren, that will show the same chemical analysis. There may be some 3,000 pounds of nitrogen per acre in vegetable organic matter and other forms, and yet not enough available to yield over 12 bushels of wheat. On just such a field Dr. Voelcker, Chemist to the Royal Agricultural Society of England, tells us less than 25 pounds of nitrogen in soluble form increased the yield to more than double. One pound of the right form of nitrogen may be worth more than 100 pounds of another but inferior form, for use as plant food.....

FARMERS do not, as a rule, says the London Agricultural Gazette, seem to realize that every drop of liquid manure wasted is so much of a most valuable stimulant lost. The merest glance at the chemical analyses of the urine of the four principal kinds of British live stock—cattle, horses, sheep, and pigs—will show that 35 parts of the total solids therein contain about 37 parts of nitrogen, or rather more than 10 per cent. of the most costly manurial ingredients used on the farm. Three cwt. of the solids of urine contain almost as much nitrogen as two cwt. of nitrate of soda, or 1½ cwt. of sulphate of ammonia.....

ONE cannot use the soil as the cook makes a cake or a pie, mixing so many ingredients and getting the same results, says the Weekly Times. It varies in composition and character for almost every square foot of it. One plot or one analysis affords little information for the rest of it. The only safe way is to supply sufficient plant food—a square meal, in fact, containing everything that the crop may or might want—in due proportion. Good stable manure made by well-fed animals is the staple fertilizer, and contains everything that plants require for their fullest and most profitable growth, and in procuring a substitute for it the safest is that mixture of artificial substances which most nearly approaches it in character and is known as complete manure. Consequently it follows that the so-called "test" with artificial fertilizers as a means of getting an approximate analysis of a soil are delusive and unprofitable.....

To give the readers a fair idea of the profit made by manufacturers, Prof. Johnson of the Connecticut Experiment Station, analyzed 68 fertilizers, the average cost of which was $34.55 per ton. The Station's average valuation was $28.70, the difference being $5.85 and the percentage difference 20.3. That is, the same quantities of nitrogen, phosphoric acid and potash, which were contained in an average ton of these fertilizers, could have been bought in raw materials of standard quality in ton lots in Connecticut, for $28.70 cash; in the average fertilizer they cost $34.55, and hence the manufacturers' and dealers' expenses and profits on a ton of fertilizer averaged $5.85, or 20.3 per cent. of the cost of the materials.....

PROF. JOHNSON gives a number of analyses of home-made fertilizers, all of which show that they compare favorably in composition with the best commercial fertilizers. Adding three dollars per ton for cost of mixing, the Station valuation and the cost to the farmers who bought the raw materials and mixed them was the same.....

THESE analyses justify the statement that while it is often cheaper to buy the best commercial mixtures, ammoniated superphosphates and special manures, than to buy and mix the chemicals, yet the experience of a yearly increasing number of farmers shows that money may be saved by the seasonable purchase of raw materials and their use in home-mixtures.....

IN 30 years' continuous growing of wheat, in the world-renowned experiments of Dr. Lawes of England, the plain superphosphate, even with the addition of potash, magnesia and soda, but without nitrogen, produced an average increase for the whole time of only 1¼ bushel per acre annually above the yield from the natural soil. The yield from the natural soil was 15¾ bushels. This was the average yield for 30 years. Some years it was only three or four bushels, and some years 23 bushels. When nitrogen, in the form of salts of ammonia (sulphate of ammonia), was added to the mixture of plain superphosphate, potash, magnesia and soda, the yield went up to nearly an average of 35¼ bushels per annum, as much, within about 1½ bushel, as from annual dressings of over 15 short tons of farm-yard manure. There were no signs of exhaustion of the soil at the end of 30 years, even with this heavy continuous cropping of wheat with the chemicals alone. But in this case all the leading fertilizing ingredients were supplied, including nitrogen. Similar results followed experiments in growing barley for some 20 years with and without nitrogen....

IT is said of Faust's Improved peanut that it does not require a rich soil, and on medium land has yielded from 100 to 130 bushels per acre. The vines average from 3½ to four feet across, making most valuable forage for stock.....

ONE of our subscribers writes us that in one instance in Monmouth County, N. J., a field of 10 acres has not received any manure, except chemical fertilizers, for about 10 years, and that field is producing double the crops it did under the old system, when yard manure, marl and lime were used. Now, this result has been obtained, not by use of ordinary superphosphates; but by the application of special and high-grade fertilizers.....

SELDOM has there been such diversity of opinion as there exists at present as to what the future prices of hogs will be. Some argue that the evident shortage of supplies in the leading hog-producing Western States will undoubtedly stimulate prices. Others say that cheap corn will make hogs considerably cheaper than they are now; others, again, maintain that prices are not likely to be materially different throughout the season, as the above two influences are likely to act as a check on each other in the way of an advance or a decline. Just now this opinion seems the most likely to turn out correct.....

AMONG the many remedies for mildew, sulphur, in one or another of its many forms, is always found most efficacious, and it is used in a variety of ways. The flour of sulphur has been used for many years for this trouble by dusting it over the mildewed plants. This mode of using sulphur is undoubtedly good at times, but in Mr. W. H. Taplin's experience, as recorded in Garden and Forest, a better way is this: Take of moderately strong tobacco-water, one gallon; add to it four ounces of sulphur, then boil the mixture for 30 minutes or a little longer. After it has cooled, add one part of water to every three parts of the mixture, and syringe the affected plants. In bad cases a second or even a third application may be necessary on successive days. This mixture also tends to keep down green fly, thereby doing double duty..

ANOTHER mixture in great favor with some growers is sulphate of lime. A good recipe for this compound is the following: Take of fresh lime, five pounds; of sulphur, five pounds, and of water, six gallons. This should be boiled down to two gallons; after which it should be allowed to settle, and only the clear liquid should be used at the rate of half a pint of the sulphate to an ordinary watering-pot of water. The plants should be syringed with the latter mixture on two or three successive afternoons.....

SULPHATE of potassium has also been highly recommended, in the proportion of half an ounce of the sulphide to two gallons of water, applied in the same manner as the preceding mixture. The unpleasant odor of the potassium solution may sometimes prove to be an objection, however.....

COMMMRCIAL muriate of potash contains about 80 per cent. of muriate of potash, 15 per cent. or more of common salt. It contains about 50 per cent. of actual potash.....

SULPHATE of potash usually contains about 25 per cent. of actual potash and 30 per cent. of sulphate of magnesia and three per cent. of common salt, besides sulphates of lime and soda.....

IF we were raising peaches largely, we would use ground bone and kainit or muriate of potash.....

THE LONDON AGRICULTURAL GAZETTE says that Mr. Voss estimates that 700,000 to 800,000 tons of bone manure and superphosphate per annum are now made in England, or four times as much as was made 30 years ago. Of basic slag, Mr. Voss says that only small quantities are used there as the soil seems but little adapted for it, and most of that which is produced is exported, chiefly to Germany, where about 300,000 tons (partly of home manufacture) are said to have been used in 1887. Half the basic slag produced in Great Britian Mr. Voss declares to be of such low quality as to be almost useless as a manure .....

MR. BOWKER strongly advocates that fertilizers should be applied a little at a time and often.

The reason for this is that quick-growing crops mature in 60 to 90 days, and should have their fertilizers ready at hand to act and supply plant food when wanted. Instead of applying large quantities of soluble fertilizers at one time for successive crops, apply what each crop requires at the time each crop is planted; and, if the crop does not seem to thrive, apply an additional quantity in between the hills or rows.....

THE R. N.-Y. commends the above to the women who propose to take the prizes in the RURAL NEW-YORKER'S Women's National Potato Contest.....

THE worst thing about the fertilizer business, says Dr. Hoskins, is that so few farmers pay cash that all have to pay credit price, as all the business has to be done through local agents. Were the farmers ready to-day, as a class, to buy their fertilizers for net cash, taking the goods from the cars in January, February and March, while the roads are good and the time convenient to get them home, they could buy their fertilizers on the average $4 per ton cheaper than they now get them. In order to do this, they would have to buy by the car-load and pay the money when the goods are delivered.....

THE N. E. Homestead mentions two large New England fertilizer firms that have given up the business because the raw material of which fertilizers are made is worth from 20 to 30 per cent. more than it was a year ago, while it is impossible to sell the manufactured goods at higher prices.....

THE Homestead advises farmers who propose to buy fertilizers to make their contracts as early as possible, for it is a question how long prices will continue without an advance, especially if the value of raw material continues firm. If farmers will only club their orders and buy their fertilizers by the car-load for cash, they will get prices that will astonish them. The manufacturer can afford to ship fertilizers by car-load direct to consumers at a profit of only $2 a ton, provided he gets the cash in hand without expenses. It is the long credits and the selling in small lots that make the business so unsatisfactory to the trade, and the prices so high to the consumers.....

LAST August Prof. Roberts of Cornell University, received from seedsmen Joseph Breck & Sons, of Boston, Mass., a package marked "Economic Seed Manure for Wheat and all Seeds." It was found, on being analyzed, to contain potash, phosphoric acid and nitrogen—the potash in the form of bichromate—and to be worth per ton $31.91. The firm charges 50 cents per four-ounce package, or at the rate of *four thousand dollars per ton.* The reader may judge of the "Economy" of the manure. Prof. Roberts gave it a careful trial, however, by growing wheat in pots, soaking one lot of seeds in a solution of the Economic Manure, another in water, and a third in a solution of Bradley's superphospbate of the same strength as the "Economic." So far from having any effect on the germination or early growth of the wheat plants, the "Economic" proved to be valueless.....

WORD FOR WORD.

——S. B. KEACH: "Sometimes it seems a pretty safe rule to calculate the merits of an article in an inverse ratio to the zeal with which it is advertised."

——N. Y. WORLD: "More or less excitement prevails in the minds of some persons over the extraordinary reports from the use of sulphate of iron, or the common copperas of commerce, when used in connection with the potash and phosphate fertilizers. The Marquis of Paris, who is also a successful fruit-grower and market-gardener, has employed it extensively. His practice is, after applying other fertilizers, to sow copperas at the rate of about one ounce to the square yard of surface for all garden crops, and for trees and fruits as well. A scientist of some reputation, who has experimented with copperas, has also reported successful results. The editor of RURAL NEW-YORKER has made four experiments in the use of sulphate of iron on corn and potatoes. The yield was less in every case where the copperas was used."

——MASSACHUSETTS PLOUGHMAN: "There have been few, if any, experiments made in potato plant feeding with fertilizers that are so extensive or more conclusive than those made at the Experiment Grounds of the RURAL NEW-YORKER."

——MAPES'S CATALOGUE: "The RURAL NEW-YORKER of July 4, 1888, describes an 'Ideal Fertilizer' as 'one that furnishes the food constituents in different forms, all of which are availa

ble, though in varying degrees, for the varying requirements of plants at different stages of growth.' This is true, and we have urged its importance for many years in our pamphlets and on all occasions. This explains the failure of tankings and many other fertilizing materials, even with good analyses. Crops have varied wants and special demands in feeding."

——"WE do not recommend superphosphates for onions Whenever a superphosphate, with or without nitrate of soda, has grown a crop, it has been on land well supplied with soluble potash from previous manuring. The onion crop demands especially large supplies of potash, and this element is not supplied at all in nitrate of soda, and to a very limited extent, if at all, in average superphosphates. The land therefore, by such treatment, must become each year poorer—at least so far as regards potash. The certainties of success, particularly during adverse seasons, are largely increased by the use of a really *complete* manure, one which fully supplies the crop without getting the land out of condition."

——REPORT from the Pennsylvania State Board of Agriculture: "To many the term 'bone' conveys but one idea, viz: the bones of animals ground to a powder. This is correct, so far as it goes, but the difference in the price of the different brands of bone should convince the purchaser that there must, necessarily, be some difference in quality and value. We find on the market a variety of brands known as 'soluble bone,' 'dissolved bone,' and 'acidulated bone,' which in reality do not contain an ounce of animal bone to the ton, but which are South Carolina rock treated with acid, which is a good fertilizer for some soils and crops, but is not the bone we are looking for. Discarding these and confining ourselves to pure animal bone, we will still find a variation of ten dollars per ton in the price of the article guaranteed by reliable parties to be pure animal bone. This difference in price leads to the inference that there is some difference in quality and value, and a careful examination will show that in many cases this difference in action and actual value is even greater than the difference in price."

——"TO PREVENT misunderstanding, we would say that we have no wish or intention of being understood to assert that the brands of 'soluble bone,' 'dissolved bone,' and 'acidulated bone,' are not valuable, but we do not think it fair that the pure animal bone should be held responsible for their shortcomings and defects in plant nutrition. The name is given them for the purpose of selling them on the superior credit of animal bone and for no other purpose. They can be furnished at a much lower price and at the same time afford the manufacturer more profit, but do not furnish the same elements in the same proportions."

——"WE HAVE often claimed that nine-tenths of the fertilizers made from rock are purchased under the belief that they are made from animal bone and this belief is founded on the misleading statements in the pamphlets and circulars and also by agents. Rock should be sold by its right name. If it be not distinctly stated by the manufacturer that rock is not used it may be expected that this substitute for bone will form the basis of the fertilizer."

——"IN making the valuations for mixed goods (superphosphates, home-made superphosphates, complete manures, guanos, etc.,) it is assumed that organic nitrogen contained in the mixed fertilizer is derived from the best sources, viz.: bone, blood, animal matter, Peruvian guano, or other equally good form, and not from leather, shoddy, hair, or any low-priced, inferior forms of vegetable matter. In case of insoluble phosphoric acid, it is also assumed that it is from bone or other similar source, and not from rock phosphate. In this latter form, the insoluble phosphoric acid would be worth, commercially, only 2½ cents per pound, or a little over one-third as much as if from fine bone."

——"WE have repeatedly cautioned the farmers against placing a too literal construction on the 'valuations,' as given by the Station to the fertilizers, and we again repeat the caution, in view of the fact that it is not always practicable in an analysis of a fertilizer to distinguish some of the best from some of the poorest forms of the ingredients."

——"FOR these reasons the farmer should demand of all manufacturers a full and explicit statement of materials used, and should deal only with those whose statements can be depended upon."

——C. V. MAPES: "The use of nitrate of soda alone as a source of nitrogen on a light soil is very injudicious, as it requires very favorable circumstances to prevent a rapid waste of the costly material by leaching in solution through the soil. It loses no strength by evaporation, but by leaching."

——PROF. ATWATER in R N.-Y. of Sep. 12, 1885: "Farmers cannot afford to use commercial fertilizers at random, and it is time they understood the reason why." * * * "The right materials in the right places bring large profits. Artificial fertilizers, rightly used, must prove among the most potent means for the restoration of our agriculture." * * * "The only way to find what a soil wants is to study it by careful observation and experiments."

——STORER'S AGRICULTURE, page 235: "Almost the whole of the enormous quantity of superphosphate now used is made, not from bones, but from mineral phosphates."

——RURAL NEW-YORKER of February 11, 1888: "We have no doubt that the future will show that the best fertilizers are not those which contain a certain form of potash, phosphate and nitrogen even though provided in their highest-priced and most soluble forms, but, rather, the fertilizers that furnish the constituents in many different forms all of which are available, though in varying degrees, for the varying requirements of plants at different stages of growth."

——DR. HOSKINS, of the Vermont Watchman: "One-quarter of our fertilizing material in this State (at least one-quarter) is lost at the barn. More than another quarter is stolen by weeds, and pretty nearly another quarter that is in the soil the plants cannot get for lack of a good preparation—good plowing, harrowing, etc. Do we mean to say, then, that we farmers in Vermont do not get out of our land more than one-fourth as much as we might if we were all we ought to be, and might be, as tillers of the soil? We do mean just that."

——PROF. JOHNSON: "The difference between the excrement of fowls and that of cattle of all sorts is that the former contains in solid form all the fertilizing material of the food except what is retained in the body for growth or goes into the eggs; while a very considerable portion of the fertilizing value of the food of cattle is excreted in liquid form and is easily lost even in the stalls or barnyard. It is easy to see then why the "dung" of fowls is a richer manure than that of cattle. That of the former contains both the urinary and bowel excretions, that of the latter consists largely of the undigested food, with what of the urine may have been absorbed and retained by it."

——PROF. W. O. ATWATER: "*In those States where experiment stations or other agencies exercise a proper control over the fertilizer trade and defend honest dealers as well as consumers, there are perhaps a hundred cases of failures from using the wrong materials, or using the right ones in wrong ways, where there is one from fraud. 'Complete' fertilizers are, in a sense, irrational, but they mark the first step in the progress towards the rational use of artificial fertilizers.*"

——MASSACHUSETTS REPORT: "The state of moisture in a fertilizer exerts a no less important influence on the pecuniary value, in case of one and the same kind of substance. Two samples of fish fertilizer, although equally pure, may differ from 50 to 100 per cent. in commercial value, on account of mere difference in moisture."

——APPLETON'S CYCLOPEDIA: "The following proportional values are given by Einhof and Thaer: Eighteen tons of mangel-wurtzel are equal to 15 tons of Swedish turnips, or 7½ tons of potatoes or 3½ tons of good English hay, each quantity containing the same amount of nourishment; but the roots may be grown upon less than an acre of land, while two or three acres of good grass land are required to produce the equivalent amount of hay. The beet root is also deemed the least exhausting to the land."

——W. H. BOWKER: "Wool waste contains ammonia, but, as in hair and leather, it is in an insoluble form, and is consequently an inferior source of plant food. Those manufacturers who use it in their fertilizers are in one sense pulling "the wool" over the eyes of their patrons."

——N. Y. HERALD: "Congress is going to inquire into the low moral tone of railroad presidents. All right; but why shouldn't the railroad presidents return the compliment and investigate the low moral tone of Congress?"

——BINGHAMTON REPUBLIC: "Can a shoe that pinches a man's corn, be said to go against the grain?"

——HARPERS: "A sweet and true, a full-volumed and thoroughly trained voice is a rare gift to any man. But without a certain quality in the singer it is a perfect fruit without flavor. The singing that haunts us, which becomes part of our life, which fills the memory with tender and happy images of other days and scenes, is not necessarily that of the finest voices, but that mingling in music of voice and skill and feeling which weaves an enchanted spell."

——BOWKER FERTILIZER CO.: "Feed the plant and it will feed you." * * * "Literally, almost every drop of blood and every piece of bone are now saved throughout the country."

——"MANURE is the best fertilizer, all things considered; for it not only supplies plant food in various forms, but, being very bulky, it lightens up the soil and makes it more friable. It is, however, too slow for most quick crops, and is very ununiform in value, the manure from fat cattle being worth much more than that from young stock; and that which is housed is worth more than that which is scraped up in the barnyard. According to Dr. Goessman, a ton of stable manure averages to contain 25 pounds of plant food, while the balance, 1,975 pounds, is organic matter and water."

——"NITRATE of potash (saltpeter) contains about 13 per cent. of nitrogen, or about 16 per cent. of ammonia, and 46 per cent. of potash. This would be more extensively used as a source of nitrogen and potash if the price were not too high for agricultural purposes; but the price ranges from $100 to $140 a ton."

——"IT is claimed that farmers can buy the ingredients of complete fertilizers and mix them for themselves cheaper than they can buy the prepared fertilizers, and be more likely to get what they buy. People who urge this course forget that chemicals can be just as easily adulterated as mixed fertilizers. Of course, whether mixed or unmixed, they are now required in most States to be guaranteed by the seller; and, if the seller is responsible, the buyer will get what he pays for in one case as in the other. The question turns upon the comparative cost and whether the farmer can buy chemicals and mix them and have them in as fine a condition as the prepared fertilizers. Fineness and dryness are very important requisites for even distribution."

Hysteria and other diseases of the nervous system.

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2¼-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

Trees, Seeds and Plants.

If you want the best Garden you have ever had, you must sow

MAULE'S SEEDS.

There is no question but that Maule's Garden Seeds are unsurpassed. Their present popularity in every county in the United States proves it, for I now have customers at more than 31,000 post-offices. **When once sown, others are not wanted at any price.** Over one-quarter of a million copies of my new Catalogue for 1889 have been mailed already. *It is pronounced the most original, beautifully illustrated and readable Seed Catalogue ever published.* It contains among other things, cash prizes for premium vegetables, etc., to the amount of $3,500. **You should not think of purchasing any Seeds this Spring before sending for it.** It is mailed free to all enclosing stamp for return postage. Address

WM. HENRY MAULE,
1711 Filbert St. **PHILADELPHIA, PA.**

SEEDS.

My Annual PRICED CATALOGUE is now ready and mailed free to all applicants. It contains all the leading and most popular sorts of

Vegetable, Farm, —AND— Flower Seeds,

Besides all the desirable novelties of last season, and nearly everything else in my line of business.

ALFRED BRIDGEMAN,
37 East 19th Street, New York City.

☞OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds

D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* **In the world.**

D. M. FERRY & Co's Illustrated, Descriptive and Priced

SEED ANNUAL

For 1889

Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

Earliest Cauliflower in existence.

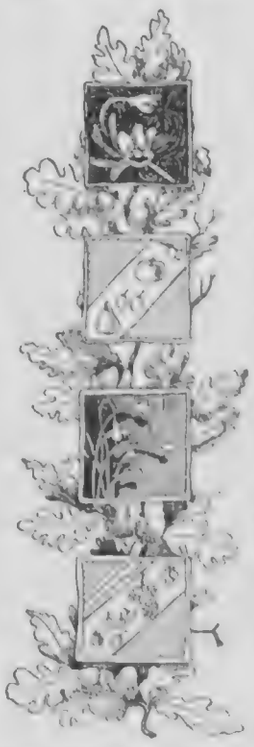
Beautiful Strawberries. We are now offering for the first time and only by us, the beautiful **Eureka**, and a strawberry that yielded at the rate of **127 Bushels** to the acre at one picking the past summer—60 other varieties; **80 of Grapes; Thompson's Early Prolific** Red Raspberry, the earliest of all; Palmer Rash the most productive early Black; **Thompson's Early Mammoth Blackberry**, etc., etc. If you mention this paper we will send you Catalogue free, telling about these beautiful berries & others Everybody wants it

CLEVELAND NURSERY,
Lakewood, Cuyahoga Co., Ohio

Our Only Novelty for 1889

IS ONE THAT NEVER FADES.



It is Evergreen, Perennial, Hardy and Useful.
It is Always "Standard," Never a Dwarf.
It Flowers and Fruits Every Month in the Year.

It was originated and "introduced" in 1846 by Andrew Jackson Downing, the father of American Horticulture. Improved by "culture," "selection," "crossing" and "grafting," by Dr. F. M. Hexamer, Thos. Meehan, Henry T. Williams and others, assisted by nearly all of the practical, successful workers in American Horticulture during the past 42 years. Thus it has been

THOROUGHLY TESTED by time, in nearly every land and clime, by hundreds of thousands of people. Its careful examination and use every month will make any bit of earth, in-doors or out-doors, to produce abundantly of ALL desirable growing things that are fitted for culture. This is

NO IMPROBABLE WONDER. but is the exact truth, being simply our way of describing that monthly product of knowledge, experience, skill and hard work—THE AMERICAN GARDEN Magazine (which also unites the old *Horticulturist*, the *Gardener's Monthly* and the *Floral Cabinet*)—to-day unquestionably the foremost monthly periodical devoted to horticulture.

The AMERICAN GARDEN is an illustrated Monthly Magazine rapidly taking rank in popularity and influence among the great magazines.

Subscription price, $2 a year; 20 cents a copy; Specimen for 6 cents.

In club with RURAL NEW-YORKER for $3.00.

Agents wanted everywhere. Good pay to respectable persons, teachers, gardeners, farmers, etc., as agents.

We always "club" with other periodicals and books at reduced prices.

SATURDAY, FEBRUARY 16, 1889.

CHANGE OF CLUBBING TERMS.

The N. Y. Weekly World and the R. N.-Y., $2.25.

The Detroit Free Press and the R. N.-Y., $2.25.

The Courier-Journal and the R. N.-Y., $2.25.

The Weekly Inter-Ocean and the R. N.-Y., one year, $2.50.

The lowest possible clubbing rates with any journal in America will be given on application. Subscribe through the RURAL NEW-YORKER.

Good, responsible agents wanted. We are prepared to offer very liberal terms. Correspondence solicited.

A MIGHTY "COMBINE" in which the farmer may trust is "Potash, Phosphoric Acid and Nitrogen."

THE attention of the readers of the R. N.-Y. is called to our catalogue notices and reviews on page 111. They will be found of more than usual interest.

WITH their permission the photographic portraits of those women who take the first ten premiums will be presented in the R. N.-Y. of November and December next.

NEW readers may notice that there are four "symposiums" in this week's R. N.-Y. This is a feature inaugurated by us years ago. It has become more and more popular with our readers, for which reason we have made preparation to present several each week during the entire year.

WHAT'S the use of all the experiment stations doing just the same work in analyzing fertilizers? What a lot of time is in this way thrown away. Here is Experiment Station A. analyzing a sample of Mapes's or Bowker's or some other brand. Here are Experiment Stations B., C., D., doing the same thing. Who gains by this?

KEEP it before the people: A "complete" fertilizer may be composed of only one per cent. of phosphoric acid, potash and nitrogen. The word "complete" is deceptive. A fertilizer may be "complete," according to the accepted usage of the word, just the same if it contain the *lowest* per cent. of the three chief plant foods as if it contain the *highest* per cent.

IF side by side with other fertilizers bone, dissolved bone-black, kainit, wood ashes, fish, nitrogen in any form, plaster, lime or any other one-sided fertilizer will secure full crops, the farmer will be justified in using such fertilizers. But it should always be borne in mind that while a one-ingredient fertilizer is being used, the soil is all the while growing poorer in other plant constituents. It is merely a matter of time before the imperfect fertilizer will fail.

No farmer has any *right* to condemn the efficacy of chemical fertilizers until he has tried what he knows to be a high-grade "complete" fertilizer, *i. e.*, one containing as much as four per cent. of ammonia, 10 per cent. of phosphoric acid and six per cent. of potash. If such a fertilizer produces no effect in a favorable season, then the farmer may conclude that his land does not, for the present, need *any* fertilizers; neither does it *for the present need any manure of any kind.*

NEW subscribers occasionally write to us asking for prices of the R. N.-Y. potato No. 2. Some assume that we sell our hybrid wheats, shrubs, plants, etc. It therefore becomes necessary that the statement should be made from time to time that we have never in any case sold anything whatever to our subscribers, except the R. N.-Y. itself, and it is not our intention ever to do so. We hold that the advice of a journal that advertises and sells its own wares through its own columns may fairly be regarded as somewhat biased.

A PERSON (we may be obliged to mention his name later), has been industriously circulating the report that the Rural New-Yorker potato No. 2 is the same as a variety originated by him. Place a tuber of the potato in a light, warm place until it sprouts. If the sprouts be not of a dark-purple color (nearly *black*), it *is not* the No. 2. There are other varieties which give dark-colored sprouts in the light. But the sprouts of the variety above alluded to, are of the usual green color.

SUPPOSE you apply 1,000 pounds of bone flour to your land each year for 10 years. Finding it of great service for five years, it is continued. But the farmer finds, later, that it does not increase his crops at all. He might naturally, though erroneously, call his land "bone-sick." Now, let him apply potash and the land responds at once, giving the finest crops ever raised upon the farm. The trouble was, not that the land had too much bone or phosphoric acid, but too little potash. The crops had appropriated all the available potash and could not live on bones alone. So, in like manner, land might seem to become "potash-sick." In such a case bone flour would prove a specific cure. Farmers should not overlook the fact that when an imperfect food alone is furnished to plants, they cannot thrive unless the soil supplies the constituents which the imperfect food does not supply. In the course of time the land yields up its present store and a perfect food must be supplied.

ONE of the things that a gardener can get ready during the leisure of winter for the busy summer time is the coal-oil butter, or kerosene emulsion that is so serviceable against many insects, and so easily applied. Prof. Trelease recommends milk, and sour milk in preference, as it does not ferment further, but soap is preferred by some. About twice as much oil as milk is used, and they are churned violently together for 15 to 45 minutes, or until the liquid suddenly thickens into a glistening butter quite homogeneous, mixing completely and readily with water, if applied a little at a time while stirring, and keeping any length of time in a closed can, no free oil appearing in it. A pint or less of the emulsion may be used in a pail of water, mixing only as wanted. A force-pump is best to do the churning, and may be used in applying the dilution. To destroy aphides which cluster on the ends of young growing shoots, we carry a basin of the dilution in one hand and bend the shoots into it with the other, shaking them to secure complete wetting.

THE DIFFERENCE.

THE R. N.-Y. does not approve of the farmer's buying commercial fertilizers; neither does it approve of his buying cow or horse manure or any other manure, if he can manufacture enough manure at home to keep up the fertility of his soil. Can the fertility of a soil be kept up by the use of commercial fertilizers alone? Yes, readers, there is not the shadow of a doubt about it. The fact that farmer A. or farmer B. has used fertilizers without any increase in his crops is no argument against their use. Did you ever use farm manure without any increase in the crops? Do not forget—no living soul can controvert the statement—that chemical analyses show—prove positively—that farm manure is but a different form of home-produced commercial fertilizer. *Concentrate* your farm manure by slowly rotting it for many years and the product is precisely the same as the commercial article in substance. It has been conclusively shown that any soil which is deficient in any one of the important constituents of which plants are composed, cannot produce a maximum crop, no matter how well it is prepared and cultivated; no matter how favorable the season. The crop will fall short just in proportion as the soil fails to give to the plant a full and complete ration of food. Tillage is manure only in so far as tillage can render available the food already in the soil. Tillage alone, like lime, will help the father but impoverish the son.

The farmer who asserts that fertilizers have no effect upon his soil, might just as well state that horse manure or any other animal manure has no effect upon his land. If animal manure, whether from birds, sheep, cattle, or horses, will give an increase of crop; if turning under clover or any other leguminous plant or any grass of any kind will give an increase of crop, so will commercial fertilizers if they are composed of the same food ingredients. That animal or vegetable manure containing the same quantity of potash, phosphoric acid and nitrogen, used in the same quantity, will give a larger crop than chemicals, the R. N.-Y. has never doubted, for the simple and only reason that they exert a mechanical influence upon the soil, and that the food they supply may exist in a more varied and acceptable form. This, however, only holds for the present season. In a series of years there is no difference; there can be no difference (except as to mechanical condition) whether the phosphoric acid, potash, nitrogen, lime, magnesia, etc., come from barn manure or chemicals.

GOLD DOLLARS FOR FIFTY CENTS.

"I CAN'T afford to pay $40, or $45 for a ton of fertilizer," said a fine-looking, intelligent farmer in this office a few days since; "20 or 30 dollars are the most I can afford to pay."

The farmer wants *plant food*, does he not? Suppose he gets twice the amount of plant food in the $40-fertilizer that he gets in the $20-fertilizer; which is the cheaper article? Why pay for the freight and double-handling of two tons if he can get the same food value in one?

"I will," says the plausible agent, "sell you 10 tons of my 'Hifalutin' brand for $200, that will bring you as large crops as the fertilizer you have been using—10 tons of which cost you $400."

It is greatly to be deplored that such reasoning has weight with many frugal, hard-working farmers. Such statements are false, friends. The food constituents in fertilizers have a fixed value, and any firm that can make them for less would not find it necessary to send out agents to solicit trade. Other dealers would be only too glad to secure the entire stock. You cannot buy 20-cent loaves of bread for 10 cents, and if there were any one who, through a new discovery, could, by protecting his secret or by letters patent, do so, he would at once monopolize the entire trade.

Again, another point which the RURAL NEW-YORKER has earnestly tried to impress upon its readers (in this, as in the above case, without any support from its esteemed contemporaries) is that a fertilizer which costs the farmer $20 per ton and is found by analysis to be worth $15, is dearer than the fertilizer which costs $40 per ton and analyzes to be worth $35. *The difference in either case is but $5 a ton.* But in the case of the high-priced fertilizer the amount of difference between the actual value and the selling price is 14⅛ per cent., while in the case of the low-priced fertilizer it is 33⅓ per cent. *The farmer actually pays 19 per cent more for the "cheap" fertilizer than he does for the high-priced one. In other words, he loses 19 per cent., besides paying the same freight, while the cost of distribution upon his fields is just the same in the one case as in the other.* That is to say, it costs just as much to distribute $15 worth of plant food as it does to distribute $35 worth.

Does the RURAL NEW-YORKER condemn low-priced fertilizers? *By no means.* What we desire to impress upon our readers is that the services of a faithful laborer for a full day are worth more than the services of a *less* faithful laborer for half-a-day; that, if a man's health and strength can not be maintained on a full loaf, it cannot be maintained on less than half a loaf.

A $20 fertilizer may be worth half as much as a $40 fertilizer. But if so, it must contain *more than* half as much plant food in order to pay for the difference in freight and cost of distribution. Is this sound reasoning, friends? If not, why not?

BREVITIES.

SUGGESTIVE.

TO THE RESCUE.

Two interesting symposiums will be found on page 117.

THE three conservators: Potash, Phosphoric Acid, Nitrogen.

Go back upon the Triumvirate as you may, you will pay homage later.

THERE are lots of farmers on the look-out for gold dollars at 50 cents.

LET us have in our commercial fetilizers, plant food in all its varied forms.

DON'T buy chemical fertilizers if you can raise maximum crops without them.

THE R. N.-Y. presumes that the first-page cartoon to appear two weeks hence will cause the reader to "smile out loud."

Owing to the considerable space given to fertilizer topics, the Domestic Economy Dep't is curtailed and that "For Women" left out entirely.

HAVE any of our readers ever experimented with Alfalfa as silage? We shall be glad to know how Alfalfa compares with clover as an ensilage plant.

THE series of articles "New Legislation Needed Concerning Monopolies," by W. I. Chamberlain, president of the Iowa Ag College, will commence next week.

A NUMBER of carefully conducted experiments made in England show that the use of sulpbate of iron reduced the crops, thus corroborating the R. N.-Y.'s experiments made two years ago.

FRESH stable manure contains in every ton about 1,970 pounds of organic matter and water. The remaining 30 pounds are plant food—virtually potash, nitrogen and phosphoric acid. These are just what you get in chemical fertilizers.

THE extensive use of rock, etc., for phosphoric acid is what keeps the price of bone down to its present low figure. Should all the fertilizer-makers in the country decide to use bone instead of rock, the price of bone in less than a year would be $100 or more per ton.

THE R. N.-Y. wants its readers to use or not to use commercial fertilizers as they are or are not profitable. But it wants them to be positive about it. We know of no more economical way of finding this out than by using them upon a small area experimentally.

THOSE who have fertilizers to buy will find the announcements of our best fertilizer firms in our advertising columns. Only two or three fertilizer catalogues have been received up to date, reviews of which will be found under, "Catalogues, Etc., Received," on page 111.

"WHOLE" would be a good prefix to those fertilizers that contain a high per cent. of the triumvirate, potash, phosphoric acid and nitrogen. "Complete" might still be retained for fertilizers containing a certain per cent. of all three. But a "complete" might not necessarily be "whole."

NITROGEN in the most serviceable form costs 16 cents a pound; phosphoric acid 8 cents; potash 5 cents. You can't get them for less unless you buy them from a thief or a fool. If you prefer your nitrogen in hair; your phosphoric acid in S. C. rock; your potash as muriate, that is a different matter.

EVEN fertilizer men admit that farm manure is more serviceable, all things considered, than chemical fertilizers. Did you ever use a liberal quantity upon a field and yet fail to get fine crops? Was it the fault of the barn manure? "No, it was a bad, droughty season." Had chemical fertilizers been used, would you have been equally charitable?

IF the farmer finds, after a fair trial of a well-proportioned fertilizer, supplying a high per cent. of the chief food ingredients, that the crops are not materially increased, let him not be fooled into trying any of the *cheaper* fertilizers that are found in the market under fancy names, such as Azotized bone, Excelsior, Equitable Special Esmeralda, 99-cent fertilizer, Champion, Planet Brand, etc. There are no secrets in compounding fertilizers, and if the preparations of reputable firms fail to increase the crops, it may be safely concluded that the land will give you full crops without fertilizers.

CATALOGUES, ETC., RECEIVED.

PETER HENDERSON & Co., 35 & 37 CORTLANDT St., N. Y.—This "Manual of Everything for the Garden" is probably the largest and costliest catalogue ever issued by an American seedsman, and the R. N.-Y. is free to say that the descriptions and illustrations are reasonably accurate and trustworthy. Novelties and seeds of special merit take up 21 pages; the regular list of vegetable seeds 22 pages; farm seeds 18 pages; flower seed novelties 7 pages; regular flower seed list 30 pages; garden tools and implements 6 pages; plant department 50 pages; or 150 large pages in all. We can only mention a few of the most conspicuously announced novelties. First is "Henderson's New Bush Lima bean" already described in these columns. Then follow Yosemite Mammoth Wax bean, Delmonico musk-melon, Dwarf Champion tomato found to be an excellent variety at the Rural Grounds the past season; Henderson's Early Puritan potato (unquestionably a first-rate early variety); the new Japanese buckwheat, everywhere concededto be a very valuable introduction; the Rural New-Yorker potato No. 2; peas, grasses, grains, etc. The novelties and lists of flowers (plants and seeds) should be examined by our readers. One hundred dollars in four prizes are offered for plants of the Bush Lima containing the greatest number of pods. The price of this valuable catalogue is 25 cents (in stamps) which amount, however, may be deducted from the first order.

W. ATLEE BURPEE & Co., PHILADELPHIA, PA.—This catalogue (168 pages) calls for an extended notice. It announces the R. N.-Y. potato. It also announces the "Superior" potato, a seedling of that public benefactor E. L. Coy, who has originated more excellent potatoes than any other man living or dead. The Superior is a white, shapely potato as it was grown at the Rural Grounds last year. It was so injured by the flea-beetle that we could make no fair estimate of the yield. Jonathan Talcott praises it unqualifiedly. The catalogue gives a first-rate list of potatoes in general. It finds the White Elephant and Late Beauty of Hebron the same. The R. N.-Y. made this announcement many years ago.

Burpee's Quantity and Quality peas were grown at the Rural Grounds last year. They are akin to Bliss's Everbearing and Abundance. They also resemble Henderson's Midsummer pea, though distinct from it enough in some respects to show that they are not identical. Planted April 18, the first mess was gathered July 3 on Quantity and a day or so later on Quality. The vines grow abou 2¼ feet high and are of a branching habit. The pods are borne usually in pairs and are not always well filled. There are from four to six peas in a pod, yellow in color and wrinkled. Quantity gives a larger pea (seed) than Quality though less sweet. The size of the pods is about the same. Burpee's Emerald Gem is a fine strain of this best of muskmelons. The Potato-Leaf tomato will be found smoother than the Turner. The Peach tomato is an old variety revived. But it is an excellent sort for canning and very pretty in appearance. Red Victoria onion, the Matchless tomato, Delaware watermelon, Pike's Peak squash, Quaker Pie pumpkin, White Gem watermelon are among the novelties seemingly worthy of trial.

The catalogue gives a life-like illustration of the Red Caps. Last year we bought a setting of eggs of this beautiful breed of fowls and the pullets and cockerels are beautifully and uniformly marked. Their combs are immense and accurately shown in the illustration. What the breed is worth as egg-producers we cannot as yet state. The catalogue offers liberal prizes and its dollar-collections are well selected. It will be sent to all R. N.-Y. readers who apply to Mr. Burpee, and it is certainly well worth applying for.

JAS. M. THORBURN & Co., 15 John Street, N. Y.—This catalogue which without any great display is always interesting and trustworthy, is this year especially so to us for the reason that it presents a full description of the R. N.-Y. potato No. 2, with illustration, and also the R. N.-Y. hybrid wheats No.'s 2 and 3 and cross-bred wheats No.'s 50, 51, 53 and 55 with an exact photographic illustration of the six kinds. These are the first of our 150 different varieties of hybrids between rye and wheat or cross-bred wheats ever offered for sale, though we are in hopes others will be offered each succeeding year for many years to come. It is still a matter of doubt whether orders can be filled before 1890. Nothing is known of their probable value outside of the Rural Grounds, and we are glad to see that Thorburn & Co. are careful not to make any of the extravagant claims usually made for high-priced novelties. We quote:

"While it is conceded that the RURAL'S collection of crosses and hybrids is not approached by any other similar collection in the world (indeed, there is no record of the existence of any other rye-wheat hybrids) we have nothing to claim for the several varieties now for the first time offered for sale; neither have we any apology to offer for the high price which we are constrained to charge." We like that. Let these new varieties, over which so many years of work have been given, stand on their own merits as ultimately they are sure to do. In this as in every other similar case, the R. N.-Y. has no pecuniary interest in their sale whatever. We shall distribute without charge small samples of these wheats among our subscribers as the stock may enable us so to do We would call the particular attention of our readers to the following varieties offered in this catalogue as being the best of their several kinds in our opinion. Beans: Ne plus Ultra dwarf, Wardwell's Kidney Wax, Thorburn's Ex. Early Refugee, Extra Early Flat Pride of Newtown. Beets: Extra Early Eclipse, Edmand's Early Blood turnip. Carrots: Ex. Early Forcing, Half-long Stump-rooted. Cabbage: Selected All Seasons, Vandergaw's Quick-growing Flat Dutch, Thorburn's Market Gardeners' Private Stock Flat Dutch, and Improved Stone-head Red Dutch. Sweet Corn: Perry's Hybrid, Early Golden Yellow, Potter's Excelsior, Hickox Improved, Ne Plus Ultra. Lettuce: Shotwell's Brown Head and Thorburn's Market Gardeners' Private Stock. Onions: New Adriatic Barletta, Mammoth White and Red Garganus. Among tomatoes the R. N.-Y. advises its readers to try Thorburn's New Jersey and, for earliest, the Early Advance.

JAMES VICK, Rochester, N. Y.—Vick's Floral Guide (98 pages) is one of the handsomest catalogues published. The illustrations are intended to give the reader a correct idea of the plant or flower illustrated. The grossly exaggerated, absurd pictures which deface so many catalogues and reflect upon the integrity of those who issue them, do not appear in this. Four excellent portraits of the male Vicks and their residences appear as a frontispiece. A life-size colored print shows the new striped rose Vick's Caprice, the open flower of which measures four inches in diameter. The petals are white with vivid stripes of pink. It is a sport from the hybrid perpetual Archid. d' Autriche. Another colored plate shows a new ivy-leaved pelargonium "Madame Thibaut." Its flowers are very large and double—color red. A third colored plate shows the Irondequoit musk-melon and McCollum's tomato. The list of potatoes is good and several new kinds are offered, among them the Early Market. It is said to be of the Ohio class and is especially recommended for early marketing as the quality is excellent in the early stages of growth or "unripe" condition. The entire catalogue is one that the R. N.-Y. greatly commends to the examination of its readers.

W. W. RAWSON & Co., 34 SOUTH MARKET STREET, BOSTON, MASS.—A very large and elegantly illustrated catalogue (125 pages) of one of the best firms in the United States The novelties for 1889 among vegetables, which may be especially noted, are Horsford's Prelude tomato and the Alligator potato. The tomato is said to be the earliest in cultivation while it is free from rot. The potato is well named, the skin being somewhat corrugated like that of the alligator. It is medium early, of good quality, flesh white, shape round. The true seeds of potatoes are offered under the name of "Bliss's Hybridized Potato Seed," page 33. Mr. Rawson is well known as the most extensive market gardener in New England.

DINGEE & CONARD Co., WEST GROVE, CHESTER Co., PA.—This well-known firm is engaged chiefly in the propagation of roses. Roses, roses of all kinds. The catalogue of 120 pages presents three colored plates and many wood-cuts of the latest novelties as well as the best of the old stand-bys.

SAMUEL WILSON, MECHANICSVILLE, BUCKS Co., PA.—There are many announcements in this catalogue, which the reader must judge of for himself by an examination of the catalogue. The Northern Spy potato (not tested at the Rural Grounds) is a heavy yielder and remarkable in many ways if the catalogue statements are to be trusted. We have ordered a lot for trial next season. Other potatoes given extra space are Stray Beauty, Watson Seedling, Charles Downing, Early Sunrise, the Maine Rose, State of Maine, June Eating, Green Mountain, Empire State, Rose Seedling, Gen. Mc. Clellan, and Pride of the Field—all of which the R. N.-Y. has raised and reported upon.

Among poultry, remarkable claims are made for what is claimed to be a new and very distinct breed called Boston Greys or Sparrow Catchers. Mr. Wilson writes us that they invariably breed true to color; that "no other breed in the United States in any way resembles them." He further says that "they will catch and kill more sparrows in one day than a boy can shoot." He also calls attention to his German Hares. "They are certainly," he says, "a valuable animal and splendid eating. Their meat is entirely different from our common rabbit, being darker and more like venison." Mr. Wilson announced his Patagonians two years ago, a breed of fowls for which much was claimed. We sent for eggs and have half-a-dozen of the hens at this time. There are scarcely two alike and we do not find Mr. Wilson's claims for them at all substantiated. We should condemn them *in toto* but for the fact that a near neighbor—an extensive poultry dealer—bought eggs at the same time and is much pleased with the breed. The catalogue is one worthy of attention. Mr. Wilson will send it without charge to any of our readers who may apply.

JAMES J. H. GREGORY, MARBLEHEAD, MASS.—The catalogue of this favorably-known house offers its usual lists of garden and field seeds. Gregory's Hard-heading cabbage is an excellent variety. Bergen Fleetwing pea, Durkee corn, Gold-coin corn claimed to be sweeter, larger and earlier than Evergreen; New Queen, Polaris and Early Oxford potatoes are among the novelties offered. Mr. Gregory's onion seed, we happen to know, usually gives full satisfaction Among the books which he has written is one: "Fertilizers: Where the materials come from; Where to get them in the cheapest form How to compound formulas, etc.," that will interest our readers.

WM. HENRY MAULE, PHILADELPHIA, PA.—This catalogue of 75 pages voluminously illustrated, is free to all. It offers a large amount of money for the best crops or specimens grown from seed bought of this firm. Clark's Early Mastodon, it is claimed, bears the largest and deepest kernel, the greatest number of rows to the ear, and is the earliest yellow dent corn known, taking into the account the size of the kernel and ear and number of rows to the ear. It is said to have ripened in from 90 to 100 days near Lake Erie. The Polaris, Potentate, Chas. Downing, Early Puritan, Empire State, Beauty of Beauties, Dakota Red and other potatoes are placed prominently before the reader. The R. N.-Y. has tried and made reports regarding most of the kinds catalogued. Many novelties among peas, melons, sweet corn, cabbages and flower seeds are announced.

NOTE.—The Polaris potato as sent out by the Department of Agriculture, is by no means the Polaris offered by seedsmen. Four pieces of the Polaris sent to us by T. H. Hoskins, of Newport, Vermont, yielded 13 pounds, or at the rate of 786 bushels to the acre. Whole number 57, of which 45 were of marketable size. They were quite uniform as to size, with eyes medium as to number and prominence. A very good-looking potato. It so resembles the Early Puritan that a portrait of one might well serve for the other. The Polaris from Washington yielded at the rate of 680.62 bushels to the acre, the yield from four pieces being 11¼ pounds. But many of these were knobby, prongy, and irregular in shape with deeper eyes. It is also a late potato. We found the Polaris from Dr. Hoskins a trifle later than Beauty of Hebron.

JOHNSON & STOKES, 217 & 219 MARKET STREET, PHILADELPHIA, PA.—This catalogue, with its gilt covers and colored leaves of specialties and novelties and colored plates, gives a striking illustration of the enterprise and progress of seedsmen. We must ask our readers to send for this catalogue and examine it for themselves, since it is so full of the announcements and commendations of kinds unknown to us that our space would scarcely allow of their enumeration. The illustration of Kaffir corn (so-called) on page 70 is true to life as grown at the Rural Grounds, though we do not commend it except for trial.

D. LANDRETH & SONS.—This seed catalogue is issued by one of the oldest houses in America. Its illustrations are from photographs—a good idea. It presents cultural hints for every month in the year and cooking notes for all the vegetables catalogued.

B. L. BRAGG & Co., SPRINGFIELD, MASS.—In this catalogue of 80 pages we find many of the new things offered in others. It offers an extra fine selection of Longfellow, yellow, which the R. N.-Y. believes to be about the most satisfactory early yellow flint in cultivation. A new tomato, the "New Bay State," seems from the description worthy of a trial.

R. D. HAWLEY & Co., 500 MAIN STREET, HARTFORD, CONN.—There are some first-rate lists in this unpretentious catalogue of 75 pages. The new Japan buckwheat, Peach tomato, Sibley squash, Henderson's Bush Lima, Ex. Early Jersey Lima; Early Essex, New Queen, Charles Downing and Rural New-Yorker No. 2 potato, are among them. Catalogue free to R. N.-Y. applicants.

I. V. FAUST, PHILADELPHIA, PA.—Faust's Early Conqueror sweet corn is described as being as early as Marblehead, of the finest quality and having a much larger ear. Faust's 1889 potato is shown by an illustration to be of perfect shape. It is said to be a week earlier than Early Rose. An improved peanut, a new cauliflower, watermelon, Faust's American hybrid tomato, a new radish, Miller's Cream Nutmeg melon, a new cucumber for pickles, etc., are among the lists of novelties. There are also several novelties among flowers announced.

CRAWFORD & SONS, CUYAHOGA FALLS, OHIO.—A catalogue of selected varieties of strawberries. Mr. Crawford is a good man, and we should order from him feeling confident that he would send us good plants true to name.

FRANK FORD & SONS, RAVENNA, O.—A catalogue (36 pages) of seeds, small fruits, trees, etc. The list of potatoes is the longest we have seen this season. The Crandall currant is offered as a meritorious novelty. A colored plate of the Eaton grape is presented.

DE FOREST ELY & Co., 1303 MARKET STREET, PHILADELPHIA, PA.—A garden manual, 98 pages, for 1889.

COLE & BROTHER, PELLA, IOWA.—Vegetable, flower and field seeds of all kinds. A catalogue of 50 pages and 16 pages of novelties. It offers the Monroe Co. Prize Potato.

T. C. DAVENPORT, 124 DOCK STREET, PHILADELPHIA, PA.—A first-rate list of new and standard potatoes. Free to applicants. The Early White Ohio promises to be an acquisition.

GEORGE W. P. JERRARD, CARIBOU, MAINE.—A list of new and several of the best standard potatoes all grown in the "Cold North," with illustrations and descriptions. The R. N.-Y. reports upon several in this number.

V. H. HALLOCK & SON, QUEENS, N. Y.—This is a large and elaborately illustrated "Floral Annual" of 68 pages. A great deal of space is given to grasses, clovers and forage crops. Sainfoin, Crimson Clover, Lucerne, with the roots of a plant sweeping over two pages, Japan clover, Alsike, Lupins' Millets, Bermuda grass, Kaffir corn are conspicuously announced. The book abounds in startling illustrations and fervid descriptions. One of the four colored pages shows a leaf of one of the ornamental beets, flowers of Bessera elegans, Cyclobothra flava, Milla biflora and Celestial peppers. We can not attempt to point out the special features of this catalogue. Many of the novelties will be considered in our special soon to appear, which will be given up chiefly to a consideration of the merits of both the standard old and new kinds.

THE HIGGANUM MANUFACTURING CORPORATION, 189—191 WATER STREET, N. Y.—This catalogue is devoted to seeds and agricultural implements. It is to the latter that we desire at present particularly to allude. Among the implements, illustrations and a description of Clark's Cutaway harrow are given. We have tried this harrow at the Rural Grounds, and can therefore speak of it in the light of some experience. Let us take the disk harrow and cut each disk so that, instead of being *round*, it is formed into six sharp right-angled blades, each diverging from the other outwards by several inches. These angular steel disks, six of each, are fixed on two axles, which may be adjusted to form, with the pole, right angles or something less, according to the work required. The blades enter the soil deeper than the round disks, cutting through sods and tossing and pulverizing the soil in a way that the older implement can not possibly do We are much pleased with it and predict that it will be considered an invaluable harrow by all who give it a thorough trial. An examination of the several cuts of the catalogue will give our readers a better idea of the implement than any attempt of ours to describe it.

PRICE & REED, 516 BROADWAY, ALBANY, N. Y.—A large-sized catalogue of flower, field and garden seeds, with colored covers and many illustrations. Headquarters of the Early Sunrise potato.

D. M. FERRY & Co., DETROIT, MICH.—One of the largest seed firms in America. The Catalogue (130 pages) will be examined with interest by all. Fruit tree, forest tree, hedge, evergreen, deciduous seeds of many kinds. Miss Blanche Ferry is represented as the largest flower, most fragrant and most perfect in form of all sweet peas. A colored plate is given. Try the Molucca Balm, the queerest plant in existence that is easily raised from seed.

GREEN MOUNTAIN GRAPE.—Circular from Stephen Hoyt's Sons, New Canaan, Conn. This grape has been highly praised by some of

our best horticulturists. It is certainly of very fine flavor and its season of ripening, will be found very satisfactory to vineyardists who wish to supply this market. Read this pamphlet.

ECLIPSE CORN-PLANTER.—Circular from The Eclipse Corn Planter Co., Enfield, N. H. This is a machine for planting seeds and distributing fertilizers at one operation. With the improvements added for this season it is certainly one of the best machines of the kind now before the public. Write for this circular and see what the planter is.

CATALOGUES OF FERTILIZERS.

THE MAPES FERTILIZER CO., 158 FRONT STREET, NEW YORK.—A pamphlet of 45 pages. This company has probably done more to popularize fertilizers than any other in America. Station analyses show that the per cent. of plant food is as high in them as in any others manufactured, notwithstanding the fact, not always recognizable by the chemist, that inferior forms are never used, such, *e. g.*, as S. C. rock, hair, etc. The basis of the Mapes fertilizers is bone, to which are added the highest grades of plant food at present known. We are personally indebted to Mr. Mapes for a deal of advice and assistance freely given during the past 14 years of our experiment work.

The company also issues another pamphlet entitled "Tobacco Growing," which should be examined by all who are interes ed in this industry. Either treatise will be sent on application.

THE BOWKER FERTILIZER CO, BOSTON, MASS.—A pamphlet of 26 pages setting forth the merits of the well-known Stockbridge fertilizers, with interesting and instructive reading matter regarding the use of fertilizers in general. Among the latter are "Feed the Plant rather than the Soil; The 'Complete' or Blunderbuss Fertilizers; Stinted in Infancy, Stunted for Life; Ninety-day Crops; Fertilizers, Agricultural, Intellectual, Moral, Political." Besides a list of the fertilizers made by this firm, "Farm Chemicals for Home Mixing" are appended. A page(21) is devoted to an account of the R. N.-Y's Potato Con:est" which with the Stockbridge Manure gave a yield of 378 bushels to the acre in spite of the injury done to the crop by the flea-beetle. The pamphlet will no doubt interest our readers.

OLD STANDARD BONE FERTILIZERS.—Circulars from the Thompson & Edwards Fertilizer Co., Union Stock-yards, Chicago Ill. This circular states that 2,382,008 head of cattle, 65,859 calves, 5,470,852 hogs, and 1,360 862 sheep were slaughtered at the stock-yards in 1887. Think of the world of fertilizing material contained in the vast herd. Thompson & Edwards say that nothing is wasted or lost except the bellow of the bullock and the squeal of the hog. Western farmers who need bone fertilizers should patronize this house.

CANADA ASHES.—Catalogue from Munroe, Judson & Stroup, Oswego, N. Y. Why Canadians should be willing to sell so much of their hard-wood ashes—representing a good portion of the life of their soil—is a mystery too deep for the average mind to comprehend. It seems as odd as the practice we Yankees are getting into of sending our rich feeding stuffs to England instead of feeding more of them to American cattle But, however unwise the practice may seem, no reasonable man can question the fact that good unleached ashes make a valuable fertilizer, particularly valuable for potatoes and small fruits. Munroe, Judson & Stroup are fully reliable and handle first-quality ashes.

BAUGH & SONS, 20 SOUTH DELAWARE AVENUE, PHILADELPHIA, PA.—A catalogue of fertilizers offered by this well-known firm. Raw-bone meal, strictly pure, with guaranteed analysis; Baugh's New-process 10 per cent. Guano; Baugh's A. A. nitrogen; raw-bone superphosphate; high-grade acid phosphate are among the fertilizers emphasized. This firm offers a $25 fertilizer, which, according to the Station analysis, averages as high as any low-grade fertilizer we know of. The R. N.-Y. desires to be understood as to its opinion of cheap fertilizers. A $25 fertilizer must analyse higher in proportion than a $50 fertilizer to be of equal value, because the costs of transportation and spreading it upon the soil are the same.

FARMERS' MANUAL & ALMANAC.—Sent by H. S. Miller & Co., Newark, N. J. The main object of this publication is to show forth the merits of the bone fertilizers made and sold by this house. This is very successfully done and all who are interested in such fertilizers will find much to interest them here

FOREIGN CATALOGUES.

JAMES CARTER & CO., 237 & 238 HIGH HOLBORN, LONDON, ENGLAND.—A large and costly catalogue of seeds, with numerous colored plates.

WEBB & SONS, WORDSLEY, STOURBRIDGE, ENGLAND.—An elaborate catalogue of seeds of all kinds

WILLIAM BULL, 536 King's Road, Chelsea. London, S. W. England. An illustrated catologue of new, beautiful and rare plants and orchids.

LITTLE & BALLANTYNE, CARLISLE, ENGLAND.—A catalogue of flower and garden seeds— 75 pages.

THE WOMEN'S NATIONAL POTATO CONTEST.

OVER $1,050 IN SOUVENIRS Contributed up to Date.

Revised List of Contributors and Contributions, Arranged, as Near as may be, According to Value.

A SOUVENIR OF SOME KIND ASSURED TO ALL WHO RAISE LARGE CROPS.

The Project Fully Indorsed by Progressive People.

The Mapes Formula and Peruvian Guano Co., New York. $100 in cash for the largest yield grown with the Mapes Potato Manure, stable manure, or both.

Rural New-Yorker. $100 in cash or souvenirs as the committee may prefer.

Lawson Valentine, President of the Christian Union Co., New York, $75 in the following books selected from the catalogue of Houghton, Mifflin & Co., New York and Boston:

Walden, by Thoreau.
Excursions in Field and Forest, by Thoreau.
Summer, by Thoreau.
Winter, by Thoreau.
Fresh Fields, by Burroughs.
Locust and Wild Honey, by Burroughs.
Winter Sunshine, by Burroughs.
Wake-Robin, by Burroughs.
Signs and Seasons by Burroughs
A Treasury of Thought, by Maturin M Ballou.
Talks Afield about Plants and the Science of Plants, by Prof Bailey.
The Philosophy of Eating, by Bellows.
Pictures of Country Life, by Alice Cary.
The Building of a Brain, by Dr. Clarke.
Rural Hours, by Susan Fenimore Cooper.
Hints on Household Taste, by Perkins.
Castilian Days, by Hay.
The Autocrat of the Breakfast Table, by Holmes.
One Hundred Days in Europe, by Holmes.
The Common Sense of Money, by Howe.
Smoking and Drinking, by Parton.
The Gates Ajar, by Elizabeth Stuart Phelps.
Beyond the Gates, by Elizabeth Stuart Phelps.
The Gates Between, by Elizabeth Stuart Phelps.
Popular Flowers, by Rand.
My Summer in a Garden, by Warner.
The Waverly Set of Sir Walter Scott's Novels, comprising 25 volumes.

Giddings & Read, Rutland, Vt., $65, as follows:
Ten prizes of 20 bulbs each of Woodbury's choice gladioli.
Ten prizes of one peck each of Rogers's Seedling Potato.
Ten prizes of one pound each of the new potato, Vermont Wonder, not yet offered for sale.
Ten prizes of one pound each of Read's Red Giant, not yet offered for sale.
Ten prizes, $1.50 each, of seeds of any kind, to be selected from their 1889 catalogue.

Prof. J. L. Budd, Iowa State Agricultural College, $50 in 100 trees of valuable new apples, pears, cherries, plums, apricots and ornamental trees and shrubs suited to the special climate of the prize-takers.

Bowker Fertilizer Co., Boston, Mass., $42.50 in one ton of Stockbridge Potato Manure for the best acre of potatoes grown with Stockbridge fertilizer or manure,

Woodason Bellows Works (Philadelphia, Pa.), $30 in powder and spraying bellows, viz: two patent double-cone bellows, extra size; two patent double-cone bellows, regular size; three single-cone bellows, large size three single-cone bellows, regular size; two spraying bellows, regular size.

S. H Parvin's Sons, Cincinnati, O., Six of Moody's Taylor System of Dressmaking. Price of each, $5 00.

W. Atlee Burpee (Philadelphia, Pa.), $25 worth of vegetable and flower seeds, selected from their 1889 catalogue, in five premiums of $5.00 each.

C. L. Ingersoll, President of the Colorado State Agricultural College, $25, in ten volumes of the works of Washington Irving, neatly bound.

Thorburn & Co. (New York), $25 worth of seeds (flower or vegetable) from their catalogue for 1889. This may be offered as one or several prizes.

Peter Henderson & Co. (New York), $25 collection of plants or a $25 collection of seeds, to be selected from their 1889 catalogue,

H. M. Engle & Son, Marietta, Pa., $20 as follows: five Paragon chestnut trees, five "Good" peach trees, 50 peach trees, assorted leading varieties.

John A. Salzer, La Crosse, Wis., $20 in flower seeds, to be selected from their 1889 catalogue.

William B. Reed, Chambersburg, Pa, $20 in 10 collections of one dozen roses each for ten souvenirs to as many ladies.

S. Frogner, Herman, Minn., $20 in potatoes, as follows:
10 prizes of one *peck* each of Early Minnesota (new).
10 prizes of one pound each of No. 18 (not for sale).
10 prizes of one pound each of No. 64 (not for sale).
10 prizes of one pound each of No. 50 (not for sale).
The pound prizes to be sent post-paid; the peck to be sent by express at recipient's expense.

E. E Stine, Cuyahoga Falls, O., $18 in a trio of pure-bred White Holland turkeys and (2) one barrel of choicest seed potatoes in his collection grown the coming season.

Chadborn & Coldwell M'f'g Co. (Newburgh, N. Y.), one 14-inch New Model Lawn Mower.

Paine, Diehl & Co. (Philadelphia, Pa.), one 7½-pint Self-pouring, Quadruple Silver plate Tea-pot, listed at $16 50.

F. M. Hance Elyria, O., $16 in one trio of Black Cochins and one trio of Light Brahmas.

John H. Evans, Lewiston, Idaho, $12 in Idaho pear trees, one to each of six successful competitors.

P. J. Berckmans, President of the American Pomological Society, $10 in cash.

T. H. Hoskins, M. D., Newport, Vt, $10 in iron-clad apple trees (his selection) in three premiums.

John Saul, Washington, D. C., $10 in choice plants to be selected from his catalogue.

Benjamin Hammond, Fishkill, N. Y., $12, as follows: Two kegs of Hammond's Slug Shot, 125 pounds each; two packages of Grape Dust, 10 pounds each.

W. W. Rawson & Co., Boston, Mass., $10 worth of vegetable or flower seeds, to be selected from their 1889 catalogue.

D. Landreth & Sons, Philadelphia, Pa., $10 worth of seeds from their 1889 catalogue.

J. C. Vaughan, Chicago, Ill., $10 collection of flowering bulbs, selected from their catalogue for 1889.

Lieut-Gov. Jones, of Binghamton, N. Y., $10 in two platform scales.

Northrup, Braslan & Goodwin Co., Minneapolis, Minn., $10 in any kind of seeds from their 1889 catalogue.

W. S. Waite, Haley, Tenn., $10 in a pair of either of the following breeds, cooped and delivered at express station: Houdans, Langshans, Silver Wyandottes, Leghorns, W. F. B Spanish, P. Cochins, Light Brahmas.

Pomeroy & Pearson, Lockport, N. Y., $9 in one set (No, 4) Botsford Wagon Springs

Porter Blanchard's Sons, Concord, N. H., $8 in a No. 5 Blanchard Family Churn,

H. L. Barricklow, Rising Sun, Ind., $5 in grape vines and ornamental shrubs.

Brainerd & Armstrong Co. (Philadelphia, Pa.), six boxes Assorted Colors Embroidery Silk put up one ounce in a box.

Mrs. D. Haskell, Exeter, Scott Co., Ill., $5 in 12 prizes of one dozen each of mixed tulip bulbs, to be sent post-paid.

Mrs. F. H. Valentine, Elizabeth, N. J., $5 in one pair of pure-bred Silver Wyandotte chicks, or three settings of eggs of the same breed.

A. P. Allen, Meadville, Pa., $3 in one Single-combed White Leghorn cockerel, delivered at express office.

Bartlett & Dow (Lowell, Mass.), one Common-Sense Milk Pail.

The White Mountain Freezer Co., Nashua, N. H., one four-quart White Mountain Freezer.

G. W. Fry, Dunlap, Mo., a choice of a setting of eggs of either Silver Wyandottes or R. C. B. Leghorns.

Mrs. O. J. Putnam, $1 in one dozen bulbs of Freesia refracta alba.

THE WOMEN'S National Potato Contest.

A Mighty Interest is Shown in the Project.

THE SOUVENIRS WILL PROBABLY AMOUNT TO OVER $1,200 IN VALUE BEFORE SPRING.

INSTRUCTIONS AND SUGGESTIONS.

THE R. N.-Y. proposes that its lady readers enter into a potato contest of their own. In the way of suggestion merely at this time, let us propose that the plot be 33 feet square, or just one-fortieth of an acre. This is a very convenient size and shape. The plot may be larger but not smaller. Each contestant will choose her own method in *every* particular, the kind and quantity of fertilizer or manure, the variety of potato, the distance apart to plant, etc., etc. It will not, of course, be required that the contestant do all or any of the actual work herself, but merely that it be done under her *direction and supervision.* The *aim will be to produce the largest quantity of merchantable potatoes on the chosen area at the least cost*; the standard of what constitutes a "merchantable" potato to be fixed hereafter. The reports (to be satisfactorily substantiated) will give the full particulars as to the kind of soil, fertilizer, manure, variety of potato and method of culture, and are to be handed in before the first of next October.

THE REWARDS.

The R. N.-Y. is collecting 500 or more rewards, or *souvenirs*, to be given to a corresponding number of the most successful contestants.

We believe this to be a very laudable project and certain to do a great deal of good in very many ways.

The R. N.-Y. begs to express the hope that those of its friends who may take the above view of the project, will continue to encourage it by donating suitable articles or by contributing such moderate sums of money as in the aggregate may enable the committee (to be appointed) to extend the number of souvenirs as far as possible, and in this way help to secure a general interest and enthusiasm throughout the entire potato growing country.

The Committee to examine the reports and to award the prizes will

Miscellaneous Advertising.

When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

be made up of persons (either men or women as preferred) whose names shall be a sufficient guaranty of strict, impartial action.

FINALLY.

All of our female readers, whether young or old, who desire to enter the lists will kindly send in their *names* and *addresses* on postal cards, *adding the words* "FOR THE POTATO CONTEST."

The value of the souvenirs already promised amounts to over $1,050, as will be seen by reference to another page. *Our lady friends are sending in their names for the contest freely and a grand national contest, likely to engage the attention of the civilized world, is assured.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

STRAWBERRY HILL PRIZE PORK PRODUCTS.

WE received from Dr. J. B. Learned a package of his pork products—sausage, lard, and scraps. The RURAL family rarely eat pork in any form, and so perhaps are not very good judges of these products. The lard, which was used for pastry and for frying purposes, seemed the purest, sweetest, and so the least objectionable that we had ever tried. The sausage was most savory and appetizing, and, when well browned, free from grease. The scraps we found an agreeable accompaniment to eggs, beans, etc. How much the knowledge of cleanliness and the neat manner of putting up the goods had to do with our enjoyment of this pig food, we, of course, cannot say.

We have never thought the pig the filthy, wallowing fellow he is usually set down to be. That he should be kept in nauseating filth and fed stomach sickening filth, while all other farm animals are kept moderately clean—clean by comparison at all events, and given wholesome food—and that the flesh of this inspissation of filth should constitute nine-tenths of the meat food of the farmer's family—wife and young children particularly—seems to us a highly culpable state of affairs.

We are not acquainted with Dr. Learned, but we certainly wish him all success, and trust that his humane and hygienic treatment of the pig as described in the RURAL of February 2, may be followed, the sooner the better, by all intelligent farmers.

WHAT A MOTHER THINKS.

THE tirade of "A Man" against refinement, in a late RURAL, is a proof of "many men of many minds," as the old copy-books used to say. It also proves that customs vary in regard to work in different parts of the country; for in this locality it is the housewives or housekeepers who work 16 hours a day, having to wash the dinner dishes while the men are resting, and to work two or three hours in the evening after they have finished the chores. While not agreeing with the young lady writer whom he criticises, in every particular, it is a fact beyond dispute that the reason why farmers' sons cannot hold their own among other educated people is that they lack the refinement some of them affect to despise, and then they wonder why refined people do not like to associate with them. I have often noticed the children of farmers, and always observed that the little boys while small were as shy and delicate as the girls and often bade fair to become refined men.

But as they grew to manhood, they generally liked to imitate the swagger and "tall" talk of the men who frequent the grocery, and if allowed all the liberty they wanted they soon resembled them. I know many families where the girls are refined and the boys content to be rough and uncultivated, though the latter have had better schooling than the former. These girls never went to school to learn to paint, (more's the pity!) having only the rudiments of an education, and attending to home duties faithfully, and to me there is something beautiful in the home adornment by the daughter, if she has a natural taste for such work; for life is really more than pork and potatoes.

Concerning the fish story, I only ask "A Man" if he would think it just for his wife to throw her pailful of dirty water over his harness just blackened; why then should such ill-smelling articles as fish be cleaned in the kitchen, if there was a shed or other covered place where it could be done? Most men when they dirty a kitchen, think it is only their women folk's work to clean it after them, and after a woman spends a few years in continual back-aching scrubbing and cleaning up, she is apt to get tired or go crazy, and though supposed to be good at airing their grievances, there are plenty of suffering women who practice too much self-repression, and "die and make no sign," loyal to the last to their thoughtless households.

It is no use for "A Man" to make light of, or sneer at other people's "grievances." To know how heavy another's cross is, one must feel its weight, and I know of one farmer's son who is being sent to college with the money his sisters earn in the dairy and garden. There are two sides to every question.

A MOTHER.

KINDLY THINK OVER.

SELF-IMPROVEMENT:—Are you doing anything in that line?

ARE you honestly making the most of your time?

WHAT are you reading? Anything worth thinking over or remembering?

A SCHOLAR recently remarked in our hearing that he could not understand how a person after having left school with any sort of an education could be content not to continue his studies through life.

FANCY-WORK seems to us such a poor return for time spent upon it, that we can't see how any woman can afford to spend much of her time over it.

EXTRACT FROM A PRIVATE LETTER.

THE reason given by a Stelle City, Neb., subscriber, in RURAL of January 26, is worthy of being immortalized in an adage, "I am a farmer because then I can always know where my home is, and I am never out of a job," a world of good sense and logic in a nut-shell. To see the crowds of men in every city and large town, who have no homes in any good sense of the word, and who are forever out of a job, is one of the most discouraging features of society. To know where one's home is from year to year, and never to be "out of a job" are such sources of happiness and content that only those not so circumstanced, have any idea of it. To sit in an office day after day, waiting for patients or clients is detestable, utterly so, and is enough to make a man of spirit despise both himself and his profession. The farmer from the outset has his work at his finger ends, and waits only for the patronage of nature. To always know where home and work are to be found, should give every man an immense sense of rest.

MARY WAGER-FISHER.

THE COLOR LINE is settled by the use of Thatcher's Orange Butter Color, Dairymen should never fail to avail themselves of the advantages derived from its use.—*Adv.*

LATEST MARKETS.

On account of an unexpected press of advertising matter at a late hour, our market report must be very brief.

COTTON has advanced ¼c. on all grades.

POULTRY.—Live is in light supply with advanced prices. Dressed, remains about the same with slight advance on best grades.

HOPS are unchanged.

HAY is slightly lower in price, especially on lower grades.

BEANS.—Marrows are in good demand, other varieties dull.

VEGETABLES.—Potatoes remain unchanged. Bermudas, $3 00 to $6.00. Onions are very dull with prices unchanged. Cabbage, Kale, Spinach and Turnips unchanged.

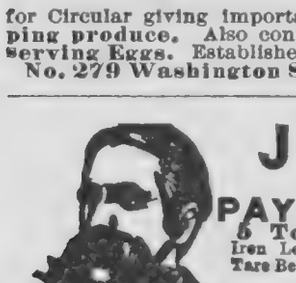
FRUITS.—The market is well supplied with all seasonable kinds, and only good grades sell readily at unchanged prices. Best Kings and Spitzenberghs sell for $2.00. Others as low as $1.00. Fancy Florida oranges are in good demand, but prices are unchanged. Cranberries are in large supply. Catawba and Concord grapes continue at 2 to 3c.

Evaporated apples and peaches are a trifle lower, but other varieties are unchanged.

Brown's Bronchial Troches

Contain ingredients which act especially on the organs of the voice. They have an extraordinary efficacy in all affections of the Throat, caused by cold or over-exertion of the voice. They are recommended to Singers and Public Speakers, and all who, at any time, have a cough or trouble with the throat or lungs. "I recommend their use to the public speakers."—Rev. E. H. Chapin. "Preeminently the best."—Rev. Henry Ward Beecher.—*Adv.*

The Kodak.



PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

HOW WE STOOD IN 1888.

WILLIAMS & CLARK CO.'S

Americus Ammoniated Bone Superphosphate

BEATS ALL RECORDS.

We make the broad claim that there is no fertilizer now on the market and offered to farmers that compares in uniform high quality with the Americus Ammoniated Bone Superphosphate. Look at the results given below from all the Experiment Stations in the New England States that publish results of their tests of fertilizers.

We challenge any competitor to show a similar record, not only in uniform quality, but where the grade has in each and every case so largely exceeded the guarantee.

Official Analyses of the Americus Ammoniated Bone Superphosphate Made in 1888.

	GUARANTEE.	ME.	VT.	MASS.	CONN.
Nitrogen	2.4 to 3.2 p. ct.	2.74 p. ct.	2 41 p. ct.	3 26 p. ct.	2 81 p. ct.
Equal to Ammonia	3 to 4 "	3.33 "	2.93 "	3.96 "	3 41 "
Available Phosphoric Acid	9 to 12 "	10.69 "	11 11 "	10.59 "	10 75 "
Insoluble		.48 "	.54 "	none "	.32 "
Potash (K^2O)	.2 to 3 "	3.12 "	3.09 "	2.71 "	3.07 "
Valuation		$29.83	$28.89	$29 85	$30.04

Notice the wonderfully available condition of the PHOSPHORIC ACID: In Maine OVER 95 per cent. of it is available, with but ONE TWENTY-THIRD part insoluble; in Vermont 95 per cent. is available, ONE TWENTY-SECOND part insoluble; in Connecticut 97 per cent. is available, and ONE THIRTY-FIFTH part only is insoluble, while in Massachusetts there is NONE insoluble, and it is ALL AVAILABLE. This is a marvelous triumph of applied chemical knowledge, and is UNPARALLELED in the manufacture of COMMERCIAL FERTILIZERS.

The AMERICUS stands UNRIVALLED for PURITY and STRENGTH, and is the

JOHNSON & STOKES, 217 and 219 Market Street, Philadelphia, Pa.

FAUST'S NEW QUEEN LETTUCE

Without question this **NEW LETTUCE** is the most tender, crisp, and delicious ever introduced. Grows to a **large size,** forms close, compact heads, does not become bitter, and is slow in running to seed; of quick growth, ready to cut early, and stands the heat well; remains for weeks of the finest quality. *Tried and tested* in all parts of the *United States*, and pronounced unequaled. See testimonials, page 1, of 1889 Catalogue. **Pkt. 10c.**

FAUST'S FARM ANNUAL for 1889 will be sent free to all who write for it. It is handsomely lithographed, and contains hundreds of illustrations and descriptions of all GARDEN FIELD AND FLOWER **SEEDS** of merit. See our list of **RARE NOVELTIES,** which cannot be obtained elsewhere. FAUST'S **COLOSSAL PANSIES** are the largest and finest ever produced. ☞ Do not fail to send for a packet, and also for "Faust on Pansy Culture" both for **25 cents.** Address all orders to

THOMAS SMOOTHING HARROW

IMPROVED REVERSIBLE HARROW

SPRING TOOTH HARROWS.

BEST IMPLEMENTS ON EARTH

HERENDEEN CO. GENEVA, N.Y.

New and Choice Field Corn

FIELD OF ORANGE COUNTY FIELD CORN.

This new Corn is entirely distinct from all other varieties, having the largest grain with the smallest cob of any Yellow Flint Corn ever offered. The kernels cover the end of the cob, in fact topping it over. The ears are eight-rowed, and about 15 inches long. We have compared it with all the leading Yellow Flint varieties, such as Longfellow, Angel of Midnight and Compton's Early, and find it much superior to any of these, in its immense yield. The stalk is strong and large, of medium height, three ears to the stalk being not uncommon, and during the past season the remarkable yield of 150 bushels was produced from one acre.

Send for our Catalogue of 1889, free to all.

W. H. CORNISH & CO., Newburgh, N. Y.

ENSILAGE

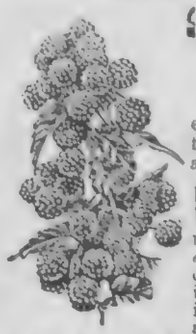
Come, Fellow Farmers!

It is the good things and the new things you want, Here is a Catalogue full of them! Do you want tested seed, raised from stock selected with extra care, grown from the best strains, got from the originators? I aim to have mine just such. Do you want new varieties that are really good, and not merely novelties? I aim to have mine such. Do you want seed that the dealer himself has faith enough in to warrant? I warrant mine, as see Catalogue. Do you want an exceptionally large collection to select from? Mine is such. Do you want them directly from the grower? I grow a large portion of mine—few seedsmen grow any! My Vegetable and Flower Seed Catalogue for 1889 **FREE to everybody. JAMES J. H. GREGORY, Marblehead, Mass.**



"MONEY IN SMALL FRUITS."

"The whole story," as told the past winter by J. H. HALE, in Lectures before vast audiences at the Farm Institutes of Wisconsin and New York, and Maine, is published for first time in our **FREE CATALOGUE,** which also describes **ALL** the **Best NEW** and **OLD varieties** of **SMALL FRUIT PLANTS** grown from **pedigree stock.**

EARHART RASPBERRY the wonderful ever-bearing black cap, has now been **tested** over the whole country. "*Would fruit the whole year through if it had a chance.*" "*Six quarts to a plant.*" "*Just ropes of berries,*" etc., are some of the reports that come to us; and it is not surprising, as it is **FRUITS FROM JUNE TO NOVEMBER** and is a prize for any family garden; and for three years past we have been unable to supply the demands for plants. Send postal at once for **FREE CATALOGUE** to **HALE BROTHERS, SOUTH GLASTONBURY, Conn.**

Literary.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

THE little minister seemed to have forgotten the crowd entirely. With eyes half closed, and his head bent down over the fiddle, he seemed to drop all memory of his rough surroundings. He was far back in the past, living his life over again, toiling again up the sad, weary road, yet happier at the wail of his violin than he had been before. His very soul was in the music, and one almost might hear the words of the beautiful song:

"I stood on the bridge at midnight,
As the clocks were striking the hour,
And the moon rose o'er the city
Behind the dark church tower."

The moon was rising over the pines below Bryan's Mill, and the moonlight came streaming down through the desolate streets of Drum Lake. It lay with strange brightness on the white snow, and peeped in at the minister as he played, while it fell hesitatingly along the pillow of the wretched woman who was praying to die.

"And like those waters rushing
Among the wooden piers,
A flood of thought came o'er me,
That filled my eyes with tears."

The music died away in a mournful wail. What a "flood of thoughts" was sweeping through the minister's mind as he played! His eyes did not fill with tears; he was long past that.

"For my heart was hot and restless
And my life was full of care,
And the burden laid upon me,
Seemed greater than I could bear."

Perhaps the dying woman heard the music as she lay in the moonlight.

"But now it has fallen from me,
It lies buried in the sea,
And only the sorrow of others
Throws its shadow over me."

The fiddle seemed to give a shout of joy as the minister bent lower over it. Perhaps *his* sorrow had fallen from him for the time.

And so the song went on, and ended at last in a sound like a wail of despair.

"As long as the heart has passions,
As long as life has woes."

There was a profound silence after the music stopped. The little tune had somehow cast a cloud over the high spirits of the company. Even the scales drooped down more dismally than ever, and the sugar barrel seemed half inclined to let go its hold on another hoop. Cobb blew his nose. Men are wont to resort to this operation when they are deeply affected, and Cobb was thinking of the immense stock of goods that had dropped from him far more effectually than the minister's care had done. The minister took his seat, and began another series of tuning.

(TO BE CONTINUED.)

The "Burlington" is the only line running sleeping cars from Chicago to Denver without change. It is the only line by which you can go from Chicago to Denver and be but one night on the road. It is the picturesque line to St. Paul and Minneapolis. It runs daily "fast trains" to Kansas City, St. Joseph, Atchison, Council Bluffs, Omaha, Lincoln, Cheyenne, and Denver.

THE WOMEN DID IT.

ON one of the most stormy, disagreeable days of the year, nearly seventeen thousand noble, patriotic women of Boston went to the polls and voted. This is not the first time the mothers, wives and daughters of this country have taken up the broom of reform, and done surprising work for the interests of their children and families. Although over twenty thousand Boston women registered, hardly anyone (save the women themselves) believed they would actually vote.

This proves that every year new avocations are opening where women demonstrate their ability, as well as capability, to transact business for themselves, and make money.

Women living near a village or large town can make many dollars "pin money" every year raising poultry and eggs. Mrs. James L. Burgess, Nashua, N. H., says she cleared last year, from only 16 hens, $36.58 for eggs alone. She could have cared for 160 hens easily, and made ten times as much. She attributes her success to the use of Sheridan's Condition Powder to make hens lay. There is no doubt that Powder is a great help. The manufacturers have for years offered cash premiums to consumers, and a proof of what we before said of women is the fact that every year, a woman captured one of their largest premiums. This year the first premium is $50.00 in gold, and we should not be a bit surprised if some woman got it, if not, she will get a lot of eggs to sell from using the Powder. Mrs. Mary J. Glenn, of Rustburg, Va., says: "Before using Sheridan's Powder I was getting from 40 hens, 5 to 7 eggs per week; during eight weeks, while using it, I got from the hens, 882 eggs, worth over thirty dollars."

I. S. Johnson & Co., 22 Custom House Street, Boston, Mass., (the only makers of Sheridan's Condition Powder to make hens lay) will send, postpaid, to any person, two 25-cent packages of Powder and a new Poultry Raising Guide, for 60 cents. The book alone costs 25 cents.

For $1.00, five packages of Powder and a book; for $1.20, a large 2¼ pound can and book; six cans, $5.00, express prepaid. Send stamps or cash. Interesting testimonials sent free.

The Vineyard.

"WOOD!"

GRAPE CUTTINGS ANSWER AS A FERTILIZER?

VIEWS OF VINEYARDISTS.

THE QUESTION.

"I have often heard that it benefited a grape-vine to bury around its roots all the trimmings and prunings, green and ripe, that are taken from the vine, there to decay and act as a fertilizer. What I would like to know is, whether the vine is benefited by such application more than it would be by applying decayed wood of any kind."

New Britain, Conn. F. G. G.

THE ANSWERS.

FROM SAMUEL ROGERS.

I deem it beneficial to cut up all grape-vine prunings and spread them broadcast about the trellis and work them into the soil with the plow and harrow. I think the grape-vine is valuable when used in this way, and better than other kinds of decayed wood, although other woods are also good. This I know from experience. I know nothing about the effects of burying the grape-cuttings around or specially near the roots of growing vines, having never done so.

Highland, N. Y.

FROM J. H. HALE.

Finely ground bone and good hard-wood ashes buried at the roots of the grape-vines, are sure to promote the growth of good healthy wood and the production of plenty of fine grapes; but that there is any special merit in grape-cuttings as a fertilizer over that of any decayed wood, I cannot comprehend, except that, possibly, they may contain, to a little greater degree, certain ash properties that would be slightly more helpful to vine growth than these to be found in other woods; yet not enough so to be worthy of practical attention.

Hartford Co., Conn.

FROM CHAS. L. JONES.

In reply to the inquiry "whether the prunings of the grape-vine, both green and ripe, are more beneficial as a fertilizer to the vine than the same amount of decayed wood of any other kind," I have to say that in my opinion they would have the preference, inasmuch as their ash ingredients contain more of the essential elements of the vine growth than any other. I think, however, that the main benefit from them will be found if they are applied as a mulch to the vine. The process of decay, and they must be decayed to act as a fertilizer, is so slow that their effect will be hardly perceptible for a long time. As a fertilizer I would not depend upon them, but I would rather give the vines a good dressing of fine bone and potash well worked in around them, and supplement it by the cuttings if there should be enough to act as a mulch, in which case they are valuable.

Newark, N. J.

FROM GEO. C. SNOW.

The danger lies in this, that if any diseased or insect-infested wood or foliage should be buried about the roots of the vines, it would be bad policy. Disease and insects indigenous to the vine increase fast enough without the protection which would be afforded them by the method proposed. Burn the cuttings first and apply the ashes. As much fertilizing value will be received in this way as by any other. Now if the mechanical condition of the soil is such that the advantages to be obtained by applying the cuttings over-balance the objection named, I would suggest running the chippings and refuse wood through an old cutting-box; the pieces can then be applied without the annoyance which would follow if the vines were buried uncut. I have no reason to think that there would be any perceptible increase of benefit from grape-wood and leaves, more than from the application of a like amount of wood and leaves of any kind.

Penn Yan, N. Y.

FROM STEPHEN HOYT'S SONS.

To bury the trimmings about the vines would be of but little value. The vine roots would be more or less cut and injured in the burying, and the food derived from the clippings would be available only after they had decayed and then it would not be enough to pay. A few handfuls of wood ashes sown over the surface of the ground, would be worth more as a fertilizer. To lightly and frequently work the soil in which the vines are planted would be beneficial; then with an application of wood ashes or a light top-dressing of manure, the vines would grow and do well. We would prefer to burn the trimmings on the ground than to bury them. Decayed wood would be better only because it could be more easily spread and it is nearer plant food than trimmings. If only partially decayed and buried near the surface, it might hold moisture a little and be beneficial in a light degree in a dry summer. We do not consider either vine trimmings or decayed wood (unless in the shape of chip manure) of value enough to spend any time in using them. Burn all such things up and reduce them to ashes and use the ashes with muriate of potash or rotted manure for the rest of the fertilizer required, with frequent stirring of the soil, and the vines will do well.

Farfield Co., Conn.

FROM WARD D. GUNN.

I cannot satisfactorily answer, even to myself, the inquiry in regard to grape-wood and prunings around vines as manure, or whether they are of more value than decayed wood of any kind. I have heard of some growers of grapes, who cut up the waste wood and trimmings short enough to be covered with the plow, and leave them on the ground to be turned under. While they are undoubtedly of some manurial value, and there is no further trouble in removing the waste from the vineyard, it is very doubtful if their application in this way would pay, counting the time required at ordinary wages. Although not relevant to the inquiry, let me state the following as incidentally touching the question: In the early days of the grape business in the Hudson Valley, the Underhill vineyards at Croton Point were noted for the excellence of their products. Mr. Wm. T. Cornell (who planted the first vineyard in Ulster County for the purpose of growing grapes for market—in 1845) was well acquainted with the Croton Point vineyardists, their methods of cultivation, etc. From him I have heard that the wood of the vines was all the manure required there; but, according to my recollection, this assertion was accompanied by the statement that the soil there was essentially different from the soil here. After that, the late Samuel Heaton and a friend from this place visited the vineyards of the late Wm. A. Underhill at the Point, and observing vines that appeared more luxuriant in foliage, vines and fruit, than the rest he called attention to them, and Mr. Underhill explained that they received the wash of a hog-pen near-by. This seemed quite satisfactory to Mr. Heaton and his friend, the latter being one of the pioneer vineyardists of the county, who had always used barn-yard manure liberally, growing No. 1 grapes.

Ulster Co., N. Y.

FROM B. WHEATON CLARK.

It would, no doubt, benefit grape-vines to bury the trimmings or any decayed wood about the roots. The application can be overdone, however, unless they are thoroughly rotted and mixed with the soil Too much decaying wood about a vine is liable to create a root fungus that would be injurious.

Niagara Co., N. Y.

Dairy Husbandry.

Burlington Butter.

WINNERS WRITE WHOLESOME STORIES, STATING SOME STERLING

DAIRY DOTS.

THE following questions were sent to the winners of the dairy prizes offered at the late Vermont Dairymen's Convention. Vermont stands in the front rank as a dairy State. Our purpose was to establish the exact pedigree of each specimen of prize butter.

1. *What breed of cows?*
2. *How were the cows fed and handled?*
3. *How was the cream cared for?*
4. *How was the butter churned, worked, colored and packed?*

HERE ARE SOME OF THE ANSWERS.

FROM GEO. AITKEN.

The butter which won the first prize, the dairy sweepstakes, and also the grand sweepstakes which was open to competitors from all parts of the United States and Canada, was made from the Billings Farm herd, of thoroughbred Jersey cows. Their feed ration was about two pounds each of oats and peas, ground, two pounds of bran, three pounds of corn-and-cob-meal, and about six pounds of corn-stalks, good, bright barley straw and clover hay cut and mixed with one-half bushel of mangolds, fed at 5 A. M. and 5 P. M. with a light feed of early-cut upland hay at noon. The cream was raised in a Cooley creamer, churned one hour in a Stoddard churn, salted with half an ounce of salt to the pound, and no artificial color was used. We have never had occasion to use any unless when short of mangolds. When this happens our butter falls off in color and most decidedly in flavor; in fact, I have never been able to make a first-class article of butter in winter without plenty of mangolds to give it a grass flavor.

The Billings Farm herd have been carefully selected with regard both to the quantity and quality of their butter. If a cow at four years of age, with her second calf, fails to demonstrate that she is capable of making two pounds of first-class butter per day, she is discarded, being sold either to the butcher or to some milkman as an unregistered cow, no transfer being given with such cows.

This matter of the quality of a cow's product is something which ought to receive more attention from breeders of dairy cattle, as one cow giving badly flavored cream will spoil the butter of a whole dairy, and if breeders and dairymen would test their cows for this purpose, they would be surprised to find how many such cows there are in their herds.

Windsor Co.

FROM F. E. LAMBERTON, WINNER OF FIRST PRIZE FOR FIVE-POUND BOX.

I have a herd of thoroughbred Jerseys which breed is the finest of which I have any knowledge for butter both as regards quantity and quality. The feed consists of 20 pounds of early-cut clover and Timothy hay per day given at three feeds, with a grain ration of 1½ pound of corn-meal, 1½ pound of bran and half a pound of cotton seed-meal in the morning and the same at night, with a ration of roots occasionally. The root crop was nearly a failure last season, else I would have fed six quarts per day in addition to the above ration.

The milk is set at present in small pans and skimmed in 36 hours. The cream is ripened 36 hours before churning. I seldom use any coloring, though at present I am using a very small quantity of Thatcher's color. The cream is churned at a temperature of 62 degrees in a barrel churn until the butter begins to separate, when the temperature is reduced to 58 degrees, and the churning is continued until the butter comes in granular form, when the butter-milk is drawn off and a weak brine is added for the first washing. After this clear water is put in and the butter is washed once. It is then salted with three-quarters of an ounce per pound of Higgins's salt while yet in granular form, and, after standing a short time, it requires but little working with the lever-worker, to make it ready for market. In order to make a prime article, perfect cleanliness must be observed and there must be careful supervision through the whole process.

Windsor Co.

FROM H. L. DAVIS, WINNER OE THIRD PRIZE FOR TEN POUND TUB.

My herd of 17 cows are all thoroughbred Jerseys with the exception of two that are high-grade Jerseys. The milk is set from 30 to 36 hours in shallow pans; but it is skimmed before souring. The cream is allowed to become slightly acid before it is churned. It is then churned in the Stoddard barrel churn, and requires churning for from 30 to 45 minutes. The latter time I think gives the better-grained butter. It is then washed in the churn while in granular form. It is salted with Higgins's salt—half an ounce to the pound—being pressed dry before the salt is added. It is worked only once, with a lever-worker, which I consider the best. At this time of year the butter is colored a little; I use three tea-spoonfuls of Wells, Richardson & Co's. coloring to 50 pounds of butter. The butter is packed in 10, 15, 20 and 25 pound tubs and sent to market every week. One man has had it all for 13 years.

Each cow has daily 18 pounds of early-cut Timothy with a slight mixture of clover hay fed at three meals; four pounds of dry corn-fodder, cut fine, fed at two meals, six pounds of corn-meal, two pounds of bran, and seven-eighths of a pound of cotton-seed-meal thrown on the corn-fodder. The grain is fed in the morning just after milking, and at night before milking. I do not dare to feed more cotton-seed-meal for I think more would injure the flavor of the butter. My cows get pure, running, spring water, twice a day. I do not find it necessary to warm it. It is natural for all animals to drink cold water, and this does not freeze in the trough. The stables are warm, never freeze, and are thoroughly cleaned twice a day. The cows are kept clean. Dry sawdust and horse-manure are used for absorbents. Cleanliness at the barn is very essential to the production of fine-flavored butter, as well as all the caution that can be used through the whole process by the makers.

Windsor Co.

FROM C. S. PAINE, WINNER OF THE THIRD PRIZE FOR FIVE-POUND PRINT.

My cows are mostly grade Jerseys. They are fed good early-cut hay, a mixture of the various English grasses and clover. Poor corn-fodder is also a part of their feed. For grain feed I have a mixture of corn-and-cob-meal, cotton-seed-meal and bran. The manner of feeding is as follows:

In the morning I give them grain. To each old cow in full flow of milk, I give about four quarts of the mixed stuff, say, about one quart of cotton-seed-meal, filling up the measure with about equal parts by measure of bran and corn-meal; then I milk, after which I feed the corn-fodder and hay. Each gets probably about 14 or 18 pounds of hay per day. I do not give them all they will eat. Next I water and tie them up in stanchions in the stable immediately after drinking. They are not fed again until about 4 P. M. Then they first get the same grain feed as in the morning; then the hay and corn-fodder come in; when the mixture is pretty well eaten I water them, and milk them about 6 o'clock.

The cream is raised in a Lincoln creamer in water at a temperature of about 40 degrees. The milk sets in 24 hours. I churn when the cream from the cold deep setting is thickened up and is in the first stages of acidity. I warm the cream by the use of hot water to get it to the proper temperature, setting the can of cream in the hot water, and stirring it meanwhile. I churn in a barrel churn at a temperature of about 65 degrees. When the butter has come in the granular form, I draw off a part of the butter-milk and pour in a pailful of water of the temperature of that in which the milk was set. This will cool the mass to about 58 degrees. I wash the butter in two more waters at about 60 degrees. Then I sift in about one ounce of Eureka salt, which I stir thoroughly into the butter. Then it is taken out and put on a lever butter-worker, and worked down about five times. It is expected that about one-half ounce of salt to a pound of butter will remain after working. The butter is immediately put into prints and sent to market next day in tin trunks The prints weigh a quarter of a pound, and are laid in trays one above another until the trunk is full.

The cows are kept in a stable where frost of any consequence never enters, and I am very particular that no barn filth gets into the pail. The cows are in all stages of milk, and all the milk goes together in one mass.

THE MAPES MANURES.

We have already acknowledged the receipt of the interesting pamphlet entitled "A talk with tobacco growers," written by Prof. Charles V. Mapes, vice-president and manager of the Mapes Formula and Peruvian Guano Co., but we have now received the regular annual pamphlet of these remarkable fertilizers, This pamphlet is entitled "The Mapes manures: true manures, not stimulants." Prof. Mapes says that by the continued use of the Mapes complete manures, in some cases for 10, 12 and 15 years, farmers, truck-growers and fruit-growers report their land as having speedily improved in condition, and their crops as double those formerly grown; while the quality of the crops has greatly improved and the profits largely increased. The actual statements from those who have used these high-grade fertilizers, which are given in much detail in this pamphlet, demonstrate the truth of this great claim for the Mapes manures.

LARGE YIELDS.

Last year the largest yields on Mapes manure on one acre of land or over were: Of potatoes, 500 bush. per acre; shelled corn, over 100 bush. per acre; oats, over 80 bush. per acre; wheat, over 40 bush per acre. It is because Prof. Mapes was so confident similar results could be obtained by all good farmers who would use the Mapes manures and give the land the proper preparation and the crop the proper culture, that he offers a prize of $500 in addition to an equal sum offered by the American Agriculturist for the best acre of potatoes grown on the Mapes manures. We believe the Mapes manures are of standard quality in every respect, and place implicit confidence in Mr. Mapes' statements as to their composition. The directions for the use of fertilizers on different crops, and the intelligent manner in which is presented the experience of those who have used these manures, recommends this pamphlet to every farmer, whether he uses fertilizers or not.

The prizes for 1889 offered by The Mapes Company (158 Front St., New York) in connection with those of leading journals (see AMERICAN AGRICULTURIST, FARM JOURNAL, and RURAL NEW-YORKER Feb. numbers) will enable growers of POTATOES, WHEAT, CORN and OATS who use the Mapes manures to secure prizes from $1200 to $40 per acre. Send postal for THE MAPES COMPANY PAMPHLET. Address,

THE MAPES FORMULA AND PERUVIAN GUANO CO., 158 Front Street, New York.

AN INTERESTING PAGE.

FROM U. S. COMMISSIONER OF AGRICULTURE, NORMAN J. COLMAN.

"But the Editor of the R. N.-Y. does not stop at testing new varieties produced by others, but is producing new varieties himself, and has accomplished wonders in hybridizing. He has opened an entirely new field for investigation, the possibilities of which cannot be conjectured."

FROM THE FARM JOURNAL.

"His farm and his home were turned into experiment grounds in the interests of his journal, and the results of careful and expensive experiments made have been freely given to the world."

FROM THE N. Y. TRIBUNE.

"The R. N.-Y. has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations."

A SYMPOSIUM

—FOR—

Every Week During 1889.

FROM THE AMERICAN AGRICULTURIST OF JUNE, 1888.

"Crops of 100 bushels of shelled corn are rare. We have seen on the farm of the Editor of the R. N.-Y. a crop of 134 bushels of shelled corn raised on one acre of ground."

$1,000 IN SOUVENIRS

—FOR THE—

Women's National Potato Contest

FROM THE GARDENERS' MONTHLY.

"The RURAL's Experiment Grounds furnish many of the facts which render it so popular."

FROM THE HARTFORD COURANT.

"Everything is an experiment here. The merest catalogue of these experiments for the garden, nursery and orchard would fill a volume."

FROM THE AMERICAN GARDEN.

"The success of the 'Potato Contest' of our friends of the R. N.-Y., has stimulated several publishers and manufacturers to the offering of large money prizes for crops to be raised during the coming year"

FROM C. V. MAPES.

"Please note the unusual array of prizes offered in the coun ry this season for the best results from potatoes. The one who obtains the largest yield of potatoes will receive almost enough to buy a small farm. This unprecedented interest in potato culture is largely due to the efforts of the R. N.-Y."

FROM AGRICULTURAL SCIENCE FOR JANUARY, 1888.

"The R. N.-Y., so far as we know, is the only agricultural journal in the world that has experiment grounds established for the benefit of its subscribers."

FROM COLMAN'S RURAL WORLD.

"The R. N.-Y. has made an undoubted cross between rye and wheat. It has also hybridized the blackberry and raspberry. Different species of roses it has also crossed."

FROM E. S. GOFF, OF THE NEW YORK AGRICULTURAL EXPERIMENT STATION.

"I wish to congratulate you on your potato, the 'Rural New-Yorker No. 2.' It yielded best here the past season of 67 varieties; bore the smallest proportion of small tubers, and, so far as the varieties have been tested, it is the best in quality of all. I predict for it a great future."

FROM THE N. Y. WORLD.

"The latest hybrids between rye and wheat growing on the grounds of the R. N.-Y., develop many curious freaks, while those of previous years are still changing in a wonderful manner."

FROM LIEUT. GOVERNOR, EDWARD F. JONES

"Binghamton, N. Y., Dec. 29, 1888.

"EDITOR RURAL NEW-YORKER: The Rural New-Yorker of December 29 is before me, and its effect on me is to impel me to express to you my sincere wishes for a Happy New Year for yourself, and continued success for the Rural, which, when contrasted with the agricultural papers of 25 years since, not only shows the improvement in the paper itself, but also illustrates the progress made by the agricultural class, much of which is due to the inspiration of the Rural New-Yorker, and such of its contemporaries as follow its example."

FROM THE AMERICAN GARDEN.

"We wish that every lover of gardening could see the garden home of the R. N.-Y., which has been so great a help to thousands of farmers and gardeners the continent over."

"The Rural New-Yorker is published for progressive intelligent farmers."

FROM EX-COM., GEN. W. G. LeDUC.

"The Rural New-Yorker strives to do good."

COME WITH US, PROGRESSIVE FARMERS,

LET US WORK TOGETHER FOR AGRICULTURE. ENTERPRISE AND PROSPERITY!

Our lady friends continue to send in their names freely for the Potato Contest. It will be a NATIONAL Contest indeed.

GEN. WM. G. LE DUC: "The efforts of the R. N.-Y. are always based upon something for the benefit of the farmers."

The Rural New-Yorker Potato No 2 will be sent to all of our Yearly Subscribers who apply, without any charge whatever. It will be sent, as the weather permits, from time to time, so that all shall receive a tuber before the planting season commences. Applications are now in order.

SECRETARY J. S. WOODWARD: "The Women's Potato Contest is a good work."

HENRY STEWART: "The Women's Potato Contest is an excellent thing."

DR. C. V. RILEY: "The Women's Potato Contest has my entire sympathy."

PRES. P. J. BERCKMANS: "I cheerfully advocate the scheme."

PETER HENDERSON: "I am glad to hear that you are going to engage the ladies in your potato contest, and have not the least doubt that it will be a success."

Applications for the R. N.-Y. Potato No. 2 must be made upon a piece of paper separate from all other communications, and the name and full address of the applicant must be given. The offer is necessarily confined to Yearly Subscribers or those who may become yearly subscribers.

MRS. A. BATTLES: "I am certain the Women's Potato Contest will be very interesting and of great benefit to agriculturists at large, and help carry out what the R. N.-Y. has so ably commenced, viz.: improved methods of cultivation and the introduction of better and more prolific varieties."

$1,100 IN GOLD
FOR THE BEST ACRE OF POTATOES.

If the prize of $500 offered by the AMERICAN AGRICULTURIST for the best acre of potatoes, goes to potatoes grown exclusively on the Stockbridge Potato Manure, we will give an additional prize of $600, making the **total obtainable $1,100 IN GOLD.** If the prize offered by the AMERICAN AGRICULTURIST is not taken by a crop raised on the Stockbridge Potato Manure, we offer the $600 for the **next best crops** of potatoes grown exclusively on the Stockbridge Potato Manure in this competition, divided as follows:

Second Prize, $225. Third, $175. Fourth, $125. Fifth, $75.

These are the largest prizes offered in this competition.

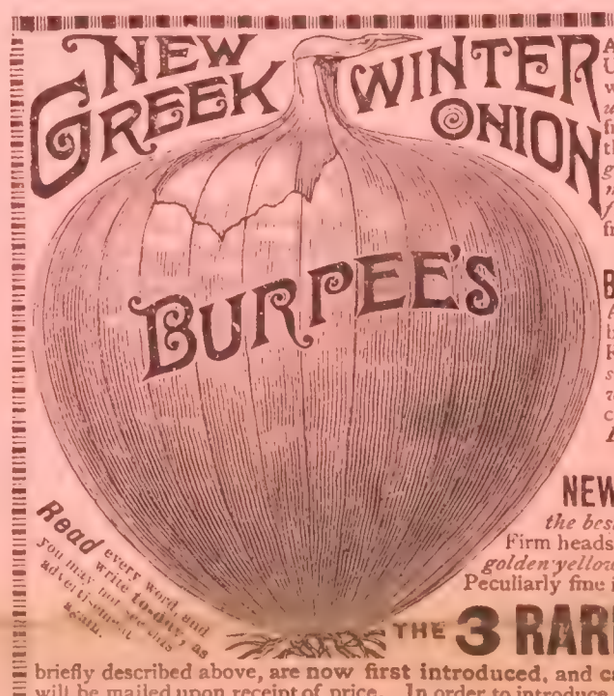
The Stockbridge System of Manuring

Seeks to make all that is now known of the principles of plant nutrition **of practical use,** and is founded on the knowledge of the deficiencies and tardy action in average soils, and the composition and wants of plants, as shown by exhaustive analyses. Accepting the soil with all its functions and offices as the seed and root-bed of plants, it turns to the living, growing crop, and aims to supply it with the food it seeks in such **form, kind, proportion and quantity** as is specially required throughout the season, and which the soil and air do not supply.

The Stockbridge Manures are both complete and special. They are **complete** in that they contain **all** the required elements of plant food, and are **special** in that they contain these elements in **forms best suited** to the crops or classes of crops to be grown, and have given almost universal satisfaction.

The prize competition is in the hands of the managers of the AMERICAN AGRICULTURIST, 751 Broadway, New York, to whom intending competitors should address inquiries. But for further information regarding these fertilizers, send to us for catalogue, mailed free.

BOWKER FERTILIZER CO., Boston and New York.



A GRAND NEW ONION from GREECE. Unlike all others in form, *extremely handsome,* with thin, brown-yellow skin. *Very early,* of *unusually mild, pleasant flavor,* most remarkable from the fact that it is the first and *only one* of the large, mild Adriatic Onions that is *really a good keeper.* Solid and fine grained, *it remains as mild* and *sweet flavored in mid-winter as when freshly gathered.* A great acquisition, furnishing fresh, mild Onions *all the year round.*
Per packet 15 cents; or 2 packets for 25 cents.

BURPEE'S WHITE GEM WATERMELON A unique new variety from China; *really a gem,* both in *distinct beauty* and *delicious quality.* Ripens *early, wonderfully prolific,* and is *the sweetest of all watermelons.* The skin is a *cream-white color,* while the flesh is rich, bright pink, crisp and juicy. See beautiful *colored plate* in *Burpee's Farm Annual for 1889.*
Per packet, 15 cents; or 2 packets for 25 cents.

NEW MID-SUMMER LETTUCE. Of early, quick growth, this is *the best of all Lettuces* for use throughout the Summer. Firm heads, most attractively colored outside, with large, rich *golden-yellow heart* within, *as tender and brittle as can be.* Peculiarly fine in flavor. Per packet, 15 cents; per oz., 40 cents.

THE **3 RARE NOVELTIES FOR 1889** briefly described above, are **now first introduced, and can only be had direct from us.** Seed of any will be mailed upon receipt of price. In order to introduce BURPEE'S SEEDS to thousands of new customers, we make the following LIBERAL OFFER. **For 50 Cents** we will mail one packet each of the above Novelties, AND ALSO one packet each of The New Volunteer Tomato,—very bright colored, smooth and early,—New Peerless Cabbage,—early, large and solid,—New Model Carrot,—the best in quality and appearance,—Globe Danvers Onion,—finest strain,—Burpee's Golden Upright Pepper,—largest, sweetest, and most handsome, New Density Okra,—New Perfection Musk Melon,—Peerless Cucumber,—Burpee's Improved Blood Beet,—New Earliest Carmine Radish,—Sugar Pumpkin and Burpee's Surehead Cabbage,—the famous *"all head and always sure to head Cabbage."*

The above FIFTEEN PACKETS of THE CHOICEST and NEW VEGETABLES at standard retail prices are worth $1.35, but we will send the entire collection, *neatly boxed,* by mail, *postpaid,* to any address, for only **50 Cents** in *postage stamps,* or FIVE BOXES for **$2.00.** We have the Largest Mail Seed Trade in America, built upon the high quality of BURPEE'S WARRANTED SEEDS, and this Remarkable Offer is made to induce thousands more to TEST OUR SEEDS. Entire Satisfaction Guaranteed to all purchasers, the great majority of whom we hope to retain as regular customers. ORDER NOW, and if you have not already received a copy, ask for **BURPEE'S FARM ANNUAL** for 1889, *enlarged and improved,* a most complete book of 168 pages, with beautiful colored plates, and hundreds of *illustrations from nature.* It tells all about the BEST SEEDS, Bulbs, Plants, and Thoroughbred Stock. It is full of useful information to every progressive farmer and gardener. Entirely free from exaggerated descriptions, it offers THE BEST SEEDS at fair prices. *Write to-day.*

The Naturalist.

TWO COLLIES.

WE take pleasure in showing our readers—at Fig. 36, on this page—what we believe to be one of the most life-like pictures of dogs ever printed. At the top of the picture is shown the head of "Fordhook Squire," A. K. C. S. Book, 10,454. Both his father ("The Squire E., 15,767) and his mother (Wanda, 13,879) are notable specimens of their breed. He is considered a true model for a collie in markings, temper and intelligence.

At the bottom of the picture an excellent likeness of "Clifton Chief," 10,445, is given. This dog is by "Cremorne," 21,010, out of "Barby Rose," 10,702. He weighs 63 pounds and stands 24 inches in hight. Both of these dogs are owned by W. Atlee Burpee, of Phila.

The RURAL'S position on the dog question is well known. We would like to organize and sustain an armed crusade against the miserable curs that infest our country neighborhoods, killing sheep and worrying cattle, frightening horses and making night hideous by their yelping and howling. We would like to put in the places of these pests just such animals as we have pictured on this page. We would thus substitute for a gang of noisy and worthless plunderers a band of lovable animals, worthy of man's friendship and care. The trained and well-bred collie seems to us to come, in intelligence and faithfulness, nearer to man than any of the other dumb animals. Such dogs are faithful, patient and brave. Watch a well-trained collie as he handles a flock of sheep. Watch him driving a herd of dairy cows from the pasture to the barn. On many sheep ranches in the West the collie is as important a factor as the shepherd. Through the dairy counties of New York almost every farmer finds a place for a collie. A good dog will pay a profit on the farm; a cur will prove only a curse.

COLLIE DOGS, "CLIFTON CHIEF" AND "FORDHOOK SQUIRE." Fig. 36.

Pomological.

QUEBEC FRUIT GROWERS.

(RURAL SPECIAL REPORT.)

"Importance of schools of horticulture;" 'American iron-clad apples; carelessness in handling and marketing fruit forcibly denounced; "strawberries and their culture;" "summer pruning of grapes;" ornamental tree planting; "sod in orchards;" Russian apples; Fameuse and its seedlings; "the best apples for home use."

THE Quebec Fruit Growers' Association (formerly the Montreal Horticultural Society) held its fourth annual winter meeting at Joyce's Rooms, Phillips Square, Montreal, Wednesday and Thursday, Jan. 30 and 31. This convention was well attended by members from various parts of the province and adjoining sections of Ontario, and its five sessions were devoted to a spirited and intelligent consideration of topics of practical and scientific interest connected with fruit growing. The exhibition of winter apples adapted to the "Cold North" was large and varied, and very encouraging to the hopes of orchardists in this and similar sections of North America. Prof. Penhallow, president of the association, in his opening address, pressed the importance of schools of horticulture. It is time, he thought, to place this art upon a scientific basis. He referred to the recent establishment, in the United States, of many experiment stations, which would unquestionably do much for pomology, and for horticultural knowledge generally. The fruit industry is a large and rapidly extending one, and should not Quebec do more for herself in the direction followed by other countries? He concluded with a wish that the sessions of this convention might be rich in useful information.

T. H. Hoskins, of Vermont, then addressed the convention upon "American Iron-Clad Apples," giving an account of the gradual collection, through the investigations and efforts of fruit-growers in the Union and Dominion, of a considerable number of apples of merit, which could be successfully grown more than 100 miles farther north than had before been thought practicable. His ob-

servations were illustrated by specimens of a number of the longer-keeping sorts of American origin, and an account of their qualities and availability for home use and for market. A lively discussion followed, in which the experience of many of the fruit-growers present, in regard to this class of fruits, was brought out. It was evident that the confidence of all of them had of late been very much strengthened in regard to the practicability and profit of orcharding in the St. Lawrence valley.

The evening session was opened with a paper by Mr. J. T. McBride, on "What the Market Demands of our Apple-growers," in which he severely criticised the careless way in which much orchard fruit is handled and sent to market. All apples, he said, should be put into new barrels, thoroughly shaken and judiciously pressed. Early apples often pay

Fig. 37.

better when sent in neat baskets. It never pays to put in small or imperfect fruit. The supply of choice fruit is never equal to the demand. He praised Montreal as a fruit market and believed that Canada has a great future as a fruit-producing country.

The Rev. Canon Fulton followed on the same topic, urging the more careful gathering of fruit, for the sake of the trees as well as of the crop; and an interesting paper on picking, sorting and packing fruit, contributed by Mrs. Annie L. Jack, of Chateauguay Basin (who, much to the regret of many, was unable to be present), was read by Secretary Dunlop of the society. Mrs. Jack expressed the belief that growers were beginning to learn that only honest packing pays, and she thinks that if the society could employ a few honest dealers to handle the fruit of its members, there would be less imposition by middlemen, and less danger of the market being overstocked. Mr. R. W. Shepherd Jr., an extensive orchardist at Como, on the Ottawa River, treating the same subject, deplored the hardship of having his carefully selected fruit brought into competition with the class of apples usually sold on the local market as "first quality," but which are really much under that grade. He spoke forcibly on the duty of each grower to establish a good name—the true principle of success in every trade.

The morning session of the second day opened with a paper contributed by Mrs. Jack, on "Strawberries and their Culture." Her list of berries ranged in the following order of merit for market: Wilson and Crescent about equal, followed by Manchester, Jersey Queen Sharpless, Cumberland, Windsor Chief, and Glendale for canning. Mrs. Jack does not rank strawberries very high in the scale of profit compared with other fruits, and spoke feelingly of the "cast-iron back and sun-proof skin" required by those who engaged in their cultivation.

Mr. W. Mead Pattison, of Clarenceville, Quebec, read a brief but thoroughly good and practical paper on "Summer Pruning of Grapes," enforcing the importance of careful pinching in and thinning, to get full and merchantable clusters, and especially as promotive of early ripening in the North. In the discussion following, varieties in the following order of market value were named: Herbert, Barry, Duchess, Worden, Champion, Brighton Delaware, Lindley, Wilder and Jewell. Some thought the Champion the most profitable. The Early Victor was condemned.

Mr. A. A. Wright, of Renfrew, Ont., read an excellent paper on ornamental tree planting, giving the preference to the American Linden, or Basswood, as a street tree, following in order with the white maple, the ash, the sugar maple (not quite hardy, in Canada, in exposed spots), the elm and the oak. The objection to the American elm is that it is often injured by sleety ice.

The afternoon session was opened with a paper on "Sod in Orchards," by Mr. J. C. Chapais, of St. Denis. Canadian experience had shown that trees in tilled land suffer greatly in severe winters. Mulched trees suffer less, and those in sod least of all. Mr. C. thought the best method to be keeping the ground free of grass for four or five feet around the trunk, covering tha space with mulch, and keeping the rest in sod.

A "symposium" on Russian apples was then started, and Vice-President Gibb gave a most interesting account of his experiences with the later importations, illustrated by an exhibition of specimens of the longer keepers. He thought there was not much hope of getting very long keepers here from a country where the summers were so much shorter, yet he was able to exhibit several sorts much larger and considerably better keepers than Fameuse; but few of these approached very near to that variety in quality. Dr. Hoskins, of Vermont, suggested the importance of growing seedlings from crosses between the best Russian and the longest-keeping American iron-clad apples, such as Bethel, Wealthy and Scott's Winter. In this he was supported by President Penhallow and others.

The question whether there is more than one Fameuse apple was then discussed, and the conclusion seemed to be that the Fameuse has many seedlings closely resembling it.

At the evening session, Mr. R. W. Shepherd Jr., read a paper on the "Best Apples for Home Use," recommending such semi-hardy varieties as Dyer and Early Joe, which may be grown with fair success when top-grafted on iron-clads. Red Astrachan, Oldenburg and St. Lawrence were favored for fall use, Fameuse and Wealthy for early, and Golden Russet and Scott's Winter for late winter. A general talk on winter varieties indicated that in this direction much was yet to be desired in the cold North. After some promiscuous discussion, the meeting was brought to a close with a few well chosen remarks by President Penhallow, on the educative value of meetings such as these had been. H.

AN EFFECTIVE METHOD OF GRAFTING.

I SEND the RURAL an illustration (See Fig. 37) of a Japanese mode of grafting. I noticed the graft among my collection of rare fruits imported from Japan. I find it a much more successful manner of grafting than the old way for the persimmon and all nuts, as these are difficult to graft. The graft is a combination of a graft and cutting; the graft is kept alive by being partly buried in the ground until sap circulation is established.

Marksville, La. J. L. NORMAND.

[This method of grafting is really a part of the "approach" and a part of the "layer" systems. Eds.]

Horticultural.

NEW SQUASH.

(*See page* 123.)

AMONG several varieties of seeds of vegetables received from Japan last spring were three varieties of winter squash, viz, Kikusa-tonasu, Chijinu-tonasu and Kobochia-tonasu. The first-named was the only one that proved of any special value; but it is certainly well worthy of mention. It is shown at Fig. 39, with half-section at Fig. 40, and, as the name indicates, it is flat and deeply furrowed and of a dull yellow color. It ranges from eight to 12 inches in diameter the largest way, and it is of about one-third that diameter from stem to blossom end. It proves to be a good keeper and is of excellent quality, being much sweeter than the Hubbard, Boston Turban, Bay State or Brazil Sugar, all of which were grown in the same field. The Hubbard, however, continues to be the general favorite among old and well tried sorts. J TROOP.

La Fayette, Ind.

Farm Economy.

ECONOMY OF TIME IN CALF FEEDING.

MR. A. J. MCLEOD, of De Soto County, Mississippi, sends us an account of his method of feeding calves. This plan is illustrated at Fig. 38. The picture needs no explanation. Mr. McLeod says that with this arrangement he can do in 10 minutes what would have required two hours under the common "knock down and drag out" system of calf feeding.

Miscellaneous.

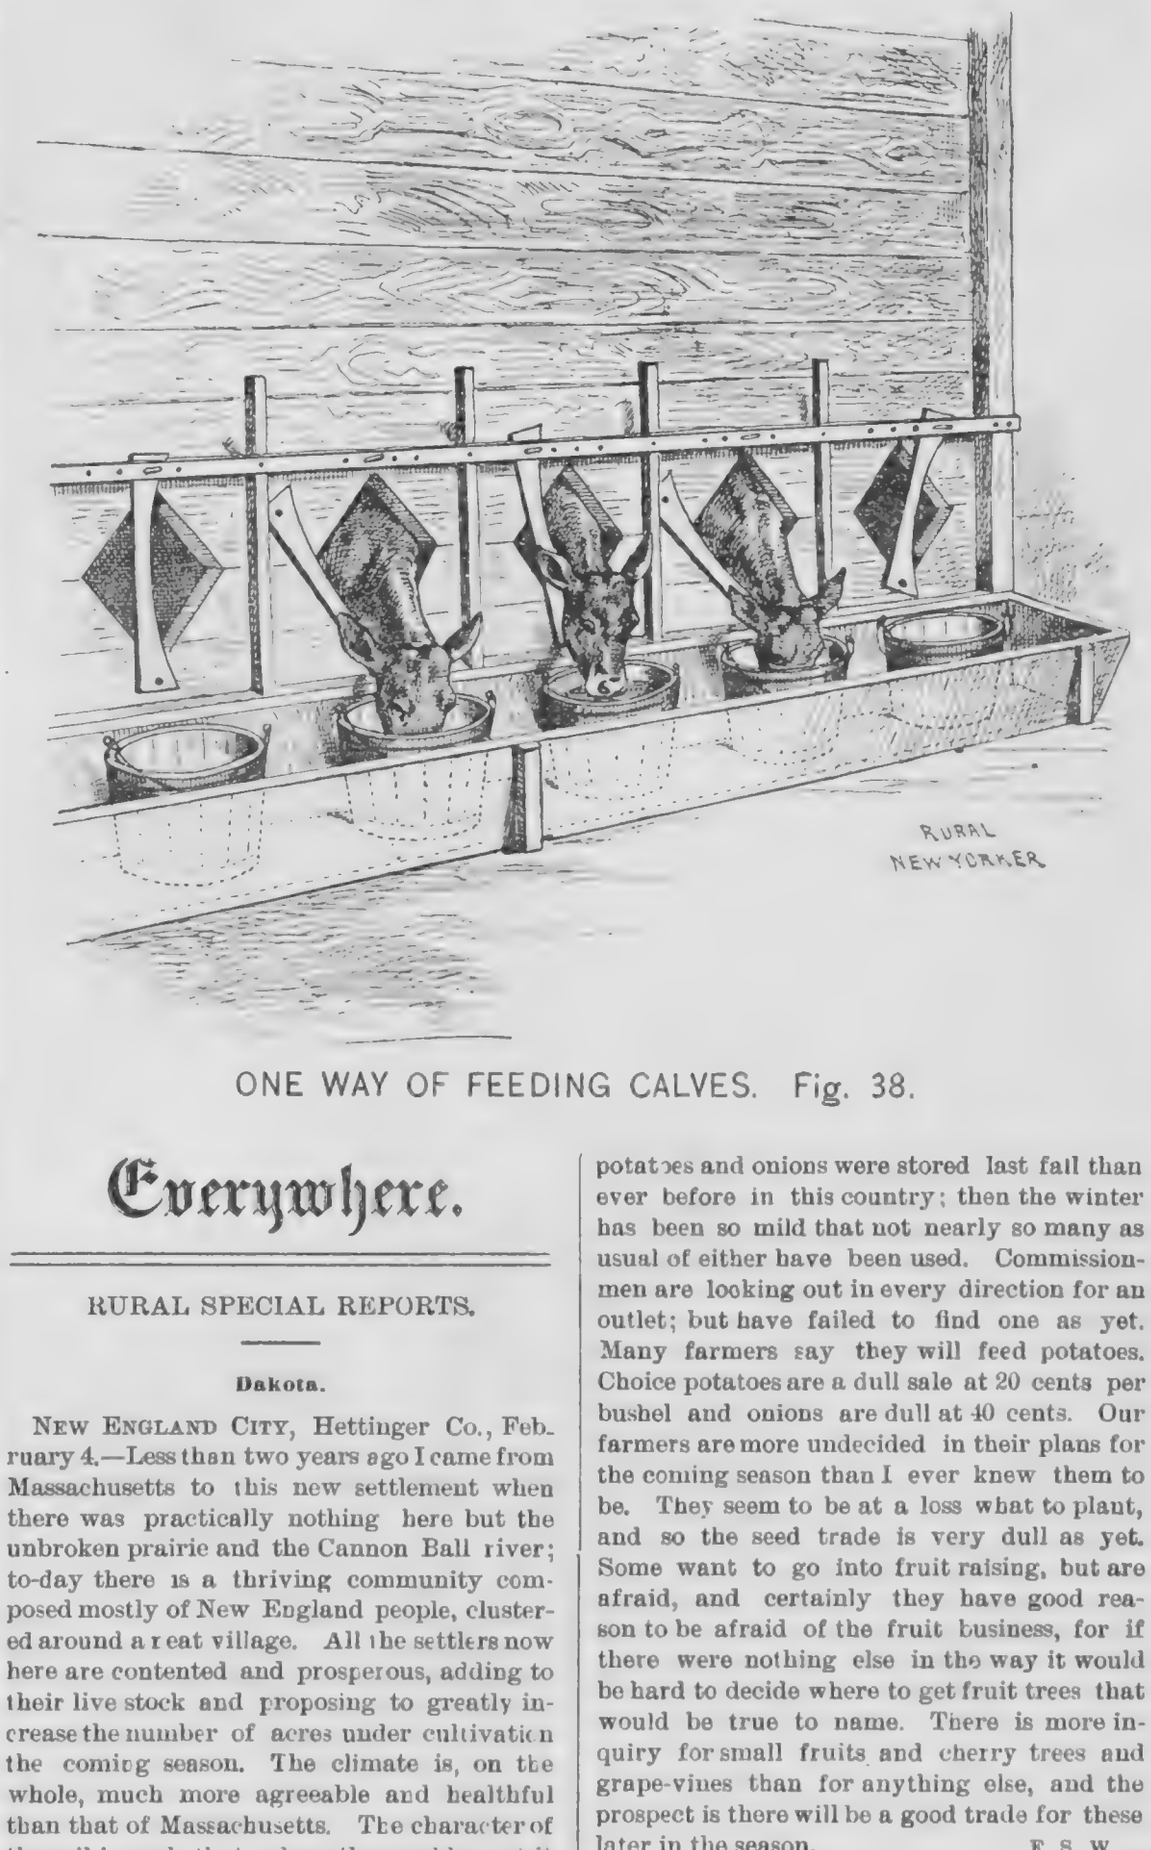
CORRESPONDENTS' VIEWS.

THE R. N.-Y. speaks of feeding two quarts of potatoes to stock per day. I am feeding nearly a bushel per day to a good-sized half-Jersey cow and two quarts to a small horse.

Uncasville, Conn. D. A. S.

MY wife says she cannot get along without the R. N.-Y. You see whenever we get into a debate she says the RURAL says so, and she thinks that puts an end to it. E. M.

Brantford, Ont.



ONE WAY OF FEEDING CALVES. Fig. 38.

RURAL SPECIAL REPORTS.

Dakota.

NEW ENGLAND CITY, Hettinger Co., February 4.—Less than two years ago I came from Massachusetts to this new settlement when there was practically nothing here but the unbroken prairie and the Cannon Ball river; to-day there is a thriving community composed mostly of New England people, clustered around a great village. All the settlers now here are contented and prosperous, adding to their live stock and proposing to greatly increase the number of acres under cultivation the coming season. The climate is, on the whole, much more agreeable and healthful than that of Massachusetts. The character of the soil is such that when thoroughly wet it holds the moisture for a long time and crops do well with a much smaller number of inches of rainfall than are needed in the East. During the last two seasons, that is, during my acquaintance with the country, there has been a sufficient amount of moisture, either from melting snow or rain, to grow good profitable crops of corn, wheat, oats, millet, potatoes and other field crops and vegetables; the rains come at about the right times in spring and summer, and there have been no heavy rains during harvesting to cause trouble, extra labor and loss. This portion of Dakota has one great advantage over most sections of the prairie country, in its abundant supply of cheap fuel in the form of lignite coal, which is easily mined and costs at present only the labor of digging and hauling. There yet remains in this region a considerable amount of Government land, and energetic and thrifty people wishing to come here to make homes for themselves and aid in building up a prosperous and law-abiding community, may be sure of a hearty welcome. Success to the RURAL, which I value as highly here as I did when I was in the East.

D. T. H.

Iowa.

DES MOINES, Polk Co., February 7.—In my last I closed with the statement that New Year's Day was the prettiest ever known in this country. January held this record all the way through. The oldest settler was puzzled. The mercury went to zero only once during the month. This is a very dry winter; no rain or snow. Water is getting very low and many wells are dry; it is hard to get water for stock; streams are very low. Stock is generally in good condition. In some neighborhoods young hogs are dying of cholera. Business of all kinds is very dull—not much doing in anything. Everything is cheap and very little of anything is selling. Hogs are in better demand than anything else and bring better prices, and they are very scarce. Some corn is selling, but it is hard to get 25 cents per bushel. Potatoes, onions and most other vegetables are not worth moving; they will hardly sell at any price. Apples are very low; only 50 cents per bushel for the best choice varieties, and sales are dull at that. More potatoes and onions were stored last fall than ever before in this country; then the winter has been so mild that not nearly so many as usual of either have been used. Commissionmen are looking out in every direction for an outlet; but have failed to find one as yet. Many farmers say they will feed potatoes. Choice potatoes are a dull sale at 20 cents per bushel and onions are dull at 40 cents. Our farmers are more undecided in their plans for the coming season than I ever knew them to be. They seem to be at a loss what to plant, and so the seed trade is very dull as yet. Some want to go into fruit raising, but are afraid, and certainly they have good reason to be afraid of the fruit business, for if there were nothing else in the way it would be hard to decide where to get fruit trees that would be true to name. There is more inquiry for small fruits and cherry trees and grape-vines than for anything else, and the prospect is there will be a good trade for these later in the season. F. S. W.

Kansas.

LEON, Butler Co., February 8.—Winter thus far has been very mild—something like an old-style Kansas winter. Crops were light in this section though feed is abundant, and stock generally are wintering well. Not as

many cattle are being fed for market here as usual. Fruit buds are abundant, but it is too early to make a promise of what the harvest will be. The peach crop for several years past has been killed in March. Maybe it will again. If the RURAL No. 2 potato succeeds as well as the Blush has done, the paper will have no reason to regret having introduced it. With eight consecutive volumes of the paper by me, I can say, "Success to the RURAL and its editors!" T. H. W.

Louisiana.

BAKER P. O., Jan. 21.—We have had a pleasant winter so far. The ground was slightly frozen this morning. Planters who did not utterly fail in making a potato crop last year, are getting ready to plant for this season. There will not be one-half the area planted in potatoes, that there was last year. Money matters are tight with planters and country merchants. R. G. B.

Michigan.

ALBION, Calhoun Co., February 6.—Our winter has been very mild; not till February 5, had the thermometer reached zero. No sleighing yet. Ice is being harvested now; it is about six inches thick. Crops were very good here except corn, and the catch of clover, like corn, was a partial failure. Winter wheat is somewhat covered with ice. Stock is doing nicely. Cows fetch $30 to $50; horses $75 to $225 per head. Wheat, 94 cents to 96 cents per bushel; oats 27 cents; butter 18 to 20 cents; eggs 14 cents per dozen. S. A.

Oregon.

PENDELTON, Umatilla Co., January 23.—Our winter has been fine. The thermometer has not got down to zero yet; the nearest it got to that point was eight degrees above, and now the weather looks like spring. Wheat is worth 70 cents a bushel. It is our principal crop. We sow it either in fall or spring, and we have never had a failure, although it froze out last winter for the first time; but our average yield was 20 bushels to the acre. G. M. H.

JOSEPH, WALLOWA Co., January 27.—We had a very dry summer. Crops as a general thing were poor, although good farmers had very good crops. Some of them report as good crops as usual. All kinds of grain are scarce and high in this country: Wheat 90 cents; oats, 1½ cent per pound; barley 1¼ cent per pound; potatoes, 1 and 1¼ cent per pound; hogs, 4 cents on foot; dressed 7 and 8 cents per pound. Hay from $6 to $12 per ton according to kind and location. Grain hay is in greater demand for milch cows than Timothy. People out here prefer grain hay for cows to anything else. I think if Eastern farmers would try this kind of hay they would never use Timothy for milch cows. Stock went into winter in poor shape. There has been no snow on the winter range so far, and if the winter holds out as mild as it has been, there will not be a very heavy loss among stock. There was a heavier loss among sheep in the fall than was ever known. We had some very bad spually weather in the fall and it knocked out the weak lambs and old sheep. We have had a very mild winter—about four inches of snow and two degrees below zero once. A great many farmers are taking advantage of the good sledding and are hauling up their year's supply of wood. Others who belong to "farming-don't-pay" kind are busy running to town, and put in their time sitting around the saloons "cussing" the country and trying to borrow money to pay their store bills. There is a grand opportunity for some thrifty farmers to get cheap homes out here, as a great many want to emigrate and will sell for what they can get over and above their mortgages. They belong to the "farming-don't-pay" class. R. A. S.

Wisconsin.

DELAVAN, Walworth Co., February 8—So far this has been the finest winter we have had in a great many years. The eldest inhabitants do not remember a nicer one. At any time so far we have not had snow enough for sleighing, and up to the present time the thermometer has been below zero only twice. Stock of all kinds are doing well; but the prices are so low that it does not pay to raise them. Fodder of all kinds is plentiful and cheap. Crops were good. Wheat per acre 20 to 30 bushels; oats, 27 to 80; barley, 20 to 50. Corn was good, though a considerable amount of it was soft. Hay was a big crop. Timothy and clover are the only kinds raised here. R. R. S.

NEW JAPANESE SQUASH. Fig. 39.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

"LOCOED" HORSES.

S. W., Coal Creek, Colorado.—I have lost three horses—one, four, and five years old respectively—by some ailment the nature of which is a puzzle to me.

I put them in a stable about Christmas, when the first snow came. I thought to fit the four and five-year-olds for sale by breaking them and getting them in flesh. They ate well for a short time and then got delicate about eating. I changed the feed from corn and fodder to oats, hay, bran, and chop corn, or rather corn-meal. They did not improve any. At times they acted like old horses, seeming to be full of life. I turned them out on fine days. Finally I gave them condition powders. They ate more; but there was no change in their appearance. As soon as the grass started I turned them out, and when they came up I fed them grain; but often they refused a feed. The grass was good and the five-year-old came out slick and lively; but the other two never shed all their coat; some of the old hair hung on in late May and early June. The four-year-old would start running; then he would eat grass for a few minutes; then lie down as if resting; get up and run a few rods. The second day he walked or ran all the afternoon. He would look back to his side now and then, and start off again, running against fences, trees or rocks, or whatever stood in his way. I did not give him anything, as he was dead when I got the medicine ordered by the doctor. The others acted in the same or nearly the same way; but they lived one day longer. The five-year-old frothed at the mouth, and at first held his head as high as possible, going round and round. He was so crazy that I cast him to force the oil down his throat. He lay as if dead for 10 or 15 minutes, then got up and started like the first, the oil coming up, and he kept going until he fell down to die. I gave the yearling nearly three pints of linseed oil and it had not operated in eight hours. I gave him a pound of Epsom salts, and in two hours it operated. Then I gave him an ounce of sweet niter. He began to feed, but in the morning he too was on the run, and died that evening. I opened the two oldest. The stomach of the first was full. At the outlet bots had formed a ring all around as close as they could get together for nearly three inches so that nothing could pass. The entire stomach was inflamed; the lower part was nearly ready to slough off, and from that to the large colon the inflammation grew less until at the point of connection there was no inflammation and none after that. The blood was as black as tar, and the liver also, with a few white lumps that appeared granular. There was but little in the bowels and what there was looked natural. There was but little in the stomach of the second and only four or five bots at the outlet: and the inflammation covered only half the stomach: but on the bowels it was as bad as it was in case of the first, only it stopped before it reached the large colon. On cutting the arteries on the back, the blood was found to contain balls that looked like grains of soaked sago. Some were white, others of a yellow tinge and some were transparent. The liver only looked black; there were no lumps in it. Some of my neighbors say the cause of the horses' death was bots. What does the RURAL say?

ANS.—The symptons given are very much like those said to result from eating some one of the "loco" plants or "crazy-weeds"—Astragalus mollissimus, Oxytropis Lamberti, and perhaps others belonging to the natural order Leguminosæ or pea family—commonly found in Colorado, Kansas, New Mexico and other portions of the West and Southwest. Of the nature of this disease very little is known, and as yet we know of no satisfactory course of treatment that can be recommended. If possible, pasture only in fields that are free from these "crazy-weeds" or "loco" plants. If you are not familiar with the plants, it would be best to exclude all plants belonging to the pea family. Thorough cultivation may be necessary to eradicate these dangerous plants from the pastures.

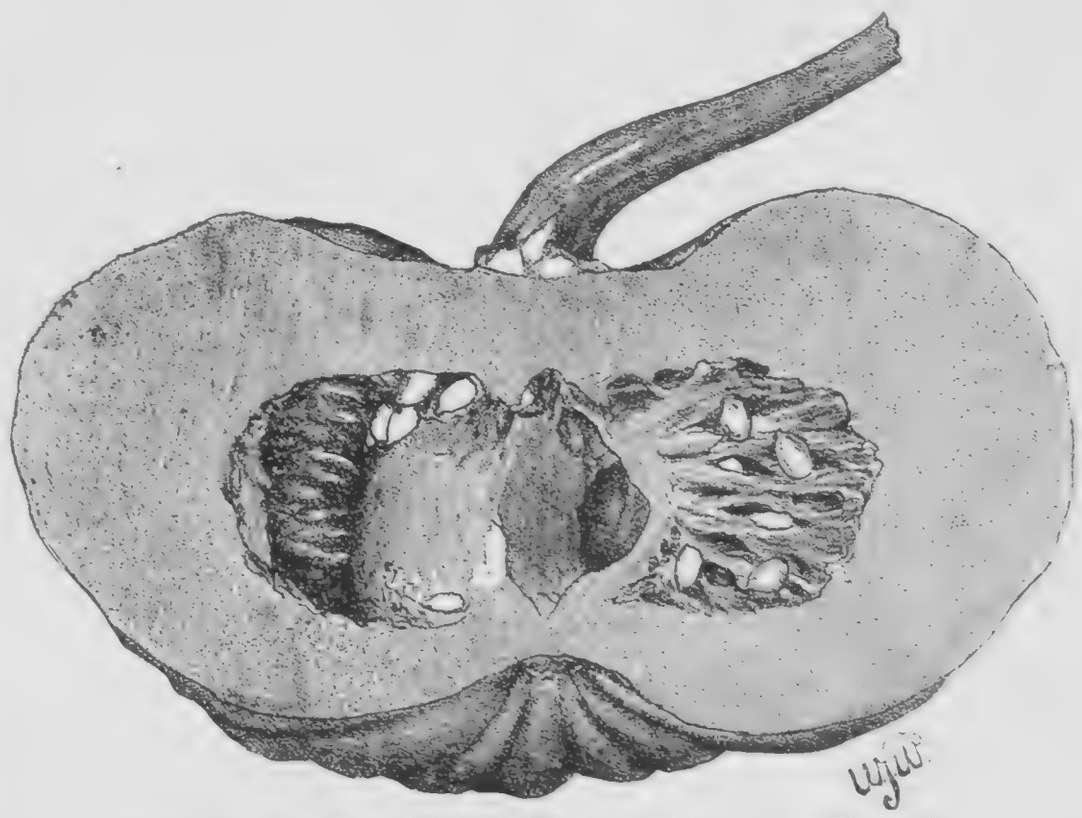
UNSLAKED AND SLAKED LIME; FATTENING SHEEP IN WINTER; HAWLEY AND PERRY RUSSET APPLES.

A Beginner, Tioga Co., Pa.—1. If I can buy slaked lime in barrels F. O. B., at 10 cents per bushel, how much should I pay for unslaked lime? I don't want to pay too much for water itself or for transporting it. 2. I want to fatten 80 sheep which cost about three cents per pound. I shall feed them four months during which I shall need how many tons of clover hay? How much oats, corn, peas and wheat bran should be fed to each? What should be the average gain in weight? Setting the manure aside for profit, will there be any more profit in the business? 3. A friend advises me to top-graft a lot of Red Astrachan trees with Doucain (pronounced here as Douse) as being a better apple in all respects. Is the Perry Russet a first-class apple for this locality?

ANS.—1. It is quite common for farmers who use lime, to buy the air-slaked lime that remains as refuse at the kilns, at a reduced price, usually seven cents a bushel, which is equal to about 10 cents for unslaked. If it has not been exposed too long—more than a month or two—it is not injured for use on the land and is in a convenient shape for spreading at once, and the labor of one handling is saved. In buying slaked lime you pay for about one-third the weight of it in water, as a bushel or 80 pounds of fresh lime will absorb 27 pounds of water in dry-air-slaking; but as the water has to be carried to the field in the spreading when the fresh lime is bought, nothing is really lost more than hauling the extra weight from the kilns in getting the air-slaked lime. As lime increases in bulk three times in the change to a hydrate by the absorption of water during the process of air-slaking, it is necessary, to prevent loss, to buy it by weight and not by measure. Many farmers pay very dearly for their lime by not knowing this fact. 2. Fattening sheep in the winter is by no means a business that can be reduced to rule. The best feeders sometimes fail to get paid for the food consumed, and sometimes incur considerable loss. For the feed of 80 sheep weighing 100 pounds each, live weight, there would be required three pounds of good hay and one pound of the mixed grain for each head, making, in all, 240 pounds of hay and 80 pounds of grain. In addition, some straw—oat-straw preferably—should be given at night for a litter, of which some would be eaten. In four months the feed used would be fifteen tons of hay and 9,600 pounds of the mixed grain. This food might bring an increase of 10 pounds for each sheep in live weight, or 800 pounds in all for each month. But the feeding season is too long for profit. A period of three months is quite long enough and perhaps too long for the most profit. If the gain in weight pays for the food and the outlay for labor (which should not be much for feeding 80 sheep,) the manure would afford a satisfactory profit. If the sheep are thrifty and good feeders and quiet in disposition—and much depends upon this—there may be a very good profit on the feeding, but as a rule, the profit of feeding thin sheep in the winter is small and uncertain, the best time being in the fall, when the flock comes off good pasture and is finished on hay and grain, and sold in January or February. 3. Unquestionably Doucain is *not* meant, but Hawley, which is known as "Dowse," or "Dows," in Pennsylvania. The Hawley, (which originated in Columbia Co., N. Y.,) is a fine, large, handsome fall apple, but very perishable. However, it may answer well for a near market. "Doucain" (properly Doucin,) is worthless as a fruit, it being a wild species, used only as a stock for dwarfing purposes. Perry Russet would be only a fall or early winter variety in Pennsylvania. It is of fairly good quality and is of medium size. In some localities it is complained of as dropping prematurely. If a keeping apple is wanted, the Golden Russet of Western New York is to be preferred.

TO PREVENT MANURE FROM FIRE-FANGING; FIGHTING THE CABBAGE MAGGOT.

F. M., South Bend, Indiana.—1. For my market garden I have to depend entirely on the horse manure I get from the city. I cannot keep it under cover and it always fire-fangs badly. What can be done to prevent it from burning? Would a heavy dressing of



NEW JAPANESE SQUASH. Half Section.) Fig 40.

salt or land plaster keep it moist? 2. What is the best remedy against cabbage maggots? I tried sulphate of potassium as was recommended by a Western market gardener in the RURAL NEW-YORKER a year ago, but the trial was not a success.

ANS.—1. Horse manure cannot be prevented from heating, if left in loose piles of even moderate size, unless they are frequently shoveled over, or are kept thoroughly saturated with water, or unless earth is mixed with the dung to the extent of at least 50 per cent. The admixture of salt, or of plaster, to any extent practically possible, would not prevent the heating. But compression will, by excluding the air, prevent it perfectly, and the best practical method of preserving and improving such manure is to keep enough swine on it to tramp it down. By trampling on it and by rooting it over, the swine will entirely preserve the dung from injurious heating, while increasing its richness by the addition of their own droppings, and of the unconsumed remnants of whatever may be fed to them. 2. There is no perfect preventive or remedy for the white maggots, which attack the roots of cabbages, turnips, radishes, etc. But they may be kept down by a liberal admixture of lime with the soil, and one should be careful also not to grow this class of plants continuously on the same ground. Where either stone lime, or oyster-shell lime, can be had cheap, it may be applied evenly at the rate of 100 bushels or more to the acre and plowed in. Where it is more costly, it will generally be sufficient to apply from a quarter to a half-pint of air-slaked lime closely around each cabbage over an area of a foot in diameter, working the lime into the soil afterwards in the course of cultivation. Unleached wood ashes have a similar effect.

SLAVERING IN A HORSE.

L. S. H., Lexington, Ky.—My six-year-old horse slavers or slobbers very badly; how should he be treated? The habit was noticed first while he was on grass and White clover late in the fall.

ANS.—Slavering or slobbering often occurs among horses fed on White clover, the flowers seeming to possess some peculiar property which renders them a source of irritation to the mucous surfaces and salivary apparatus of the animal. Some horses, however, feed on the clover without any inconvenience; and with the addition of grain they attain an excellent condition. The sharp edges of worn teeth or an ulcerated tooth or even a rough bit, will also cause slavering. So will any wound which punctures a duct of the salivary glands. It is specially liable to occur from opening abscesses in strangles and from wounds about the lower jaw. Poor food and impaired digestion are also apt to produce an increase of salivary secretion, hence slavering. It is also a symptom of several other ailments. The remedy is to remove the cause. If the trouble is due to a decayed tooth, extract it; if to the sharp edge of a tooth irritating the inside of the cheek, apply the tooth rasp until it is smooth. If it is caused by irritation of the glands of the throat or mouth, use a stimulant application of hartshorn and oil. If it is due to noxious substances in the food, change the diet. Use washes for the mouth, such as vinegar and water, or vinegar and honey. If the saliva is offensive, use water slightly tinctured with carbolic acid as a wash, and in all cases attend to the general health of the animal. In obstinate cases give a course of tartar emetic, opium, chlorate of potassa or iodide of potassium. Rub the glands beneath the ears and between the jaws with iodine ointment.

ÄERATION OF MILK.

W. C. C., Meadville, Pa.—What advantage would it be to cool milk by äerating it when it is freshly drawn from cows?

ANSWERED BY T. H. HOSKINS, M. D.

1. The rapidity with which changes injurious to milk and milk products proceed depends mainly upon the temperature of the milk. So far as äeration tends to the prompt reduction of this temperature, it is therefore advantageous. 2. It has been believed by many that there is naturally an "animal odor" in milk, which will, if retained, prove prejudicial to the quality o the butter or cheese made therefrom. Aeration is advised by those who hold this belief, as tending to purify the milk from such odor. But as excellent butter can be made from the cream of milk which has been at once placed in covered, or even submerged cans, after milking, the existence of any specific "animal odor" is seriously doubted by skilled dairymen. Foul odors in milk, contracted from the foul air of stables from unsuitable food or from filth introduced into the milk in the process of milking or otherwise, cannot be entirely removed by äeration. In these cases prevention is emphatically to be preferred to any sort of cure. 3. Aeration of clean, pure milk is therefore by no means essential in butter-making; but in cheese-making, especially in factories, äeration is considered important as a rapid means of removing the animal heat, and thus preventing the changes above referred to, which are prejudicial to the formation of a perfect curd.

FATTENING FEED FOR YOUNG PIGS.

H. F. S., Bruson, Vt.—What is a good ration for fattening five-months-old Chester-White pigs, to be killed when they are seven months old? The ration is to be made up from the following feeds: corn-and-cob-meal, wheat bran, middlings and old-process linseed-meal.

ANSWERED BY HENRY STEWART.

The best food for fattening young pigs is milk, with equal quantities of bran and meal. At the early age of five months the muscular development is not mature, and should be encouraged by food containing much lean-making material or nitrogenous matter. Without going into details, which might not be of interest, it may be sufficient to say that if milk can be procured, it may be mixed with equal parts of bran and corn-meal so as to make a slop which may be easily drank; ten pounds in four quarts of milk and two pounds of the mixed meal may be given daily to each pig in such a mess. If milk is not given the bran and meal may be steeped in water and fed in the form of a drink as with the milk; but the quantity of meal should be doubled. It should not be forgotten that fat meat contains 75 or 80 per cent. of water, and an abundant supply of drink is to be supplied to all fattening animals. No doubt the reason why so many young pigs suffer from apoplexy, and nervous diseases arising from indigestion, while fattening, is that they have not sufficient liquid food. Linseed meal or other oil-meal is not a desirable food for pigs at any time; nor is cob-meal desirable for the reason that the pig's stomach is small and naturally adapted for concentrated food.

COTTON-SEED MEAL.

F. D. C., Sandwich, Mass.—I have understood that the outsides of cotton-seeds are covered with fine, sharp points which, when ground and fed, stick in the inside of the intestines of the animals, producing more or less injury. My cows, I think, have twice been injuriously affected by the use of this article. Can the RURAL give any information in the matter?

ANS.—Cotton-seeds have no points of any kind. The fibers of the lint-cotton are all attached to the seeds, and are torn off in the process of ginning. The ends of the fibers remain on the seeds, and form a lint which cannot be wholly removed. The seed is mostly hulled and ground before it is pressed for the oil, so that the meal is usually quite free from the husk; some seeds are pressed with the hulls on, but the meal made from the unhulled seeds has no sharp points about it, although the hulls are somewhat hard and indigestible, and are objected to on that account. There is, however, an abundance of the pure meal in the market, and this is wholly free from reproach of any kind. Cotton-seed-meal is, however, an exceedingly rich food, having over 40 per cent. of albuminoids and 13 to 18 per cent. of oil in it, and for this reason it can be fed safely only in small quantities, say, two pounds daily, mixed with bran or corn-meal to enrich it. If fed more liberally it is apt to be injurious, and this is, probably, what is the matter with our friend's cows.

OBSTRUCTION IN A COW'S TEAT.

T. S. M., Newark, Ohio.—One of the teats of my young Guernsey cow is so badly obstructed that no milk can be drawn from it. How should it be treated?

ANS.—Obstructions in the teats of cows and especially of young animals, are quite common, and are generally due to improper drying off in the fall or to neglect in milking clean. Particles of the coagulated milk are arrested in the duct, and a tissue forms about the matter and adheres to the walls of the passage so as to entirely close the duct in time. There are also some other causes; but these are the most common. The only remedy is to break through the obstruction so as to unite the two parts of the duct An instrument manufactured expressly for this purpose consists of a small, round tube inclosing either a double-edged knife, or four blades at right angles to each other. The tube or sheath is pushed up the orifice of the teat until it reaches the obstacle, when the blades are pushed out, cutting through the obstruction and opening a connection between the parts, for the passage of the milk. Great care must be taken not to cut through the walls of the milk duct; for inflammation of the teat and udder would then occur, and this would be likely to injure the cow permanently for milk. For a few days after the operation it is often necessary to use the tube—after the knife has been taken out—by working it gently up the duct and through the opening made in the knot, thus keeping it opened till the parts are healed.

THE PINE GROSBEAK.

C. H., Afton, N. Y.—We have a new kind of bird here. They are a little larger than a canary and have a hooked bill. Some are brown, red and green; some are brown and yellow, and some are olive-green and flame-colored. What are they?

ANS.—They are Pine Grosbeaks. They belong to the finch family, classed by Gray among the bull-finches. Birds of this kind inhabit the northern regions of both continents, coming as far south as Pennsylvania on this side of the water, in cold winters. They do not come south as regular migrants, however, but rather as erratic visitors. At times they are plentiful in one locality, perhaps for two or three winters, whereas afterwards they may not appear there again for many years. They are charming songsters, singing toward sunset, and in captivity during the night. They are easily kept in cages and will eat most kinds of seeds, berries and fruits, becoming very familiar. In their wild state they feed on buds and seeds of various trees, especially those of firs. The female is ash-gray and brownish above with yellow tinges below and on the head, rump and tail coverts. The young resemble the female but are browner. The general color of the plumage of the males is bright carmine, with grayish-brown centers to the feathers on the back; wings blackish-brown with two white bands; the outer edges of the quills are also white. The oldest males have the most red of a rosy-carmine tint.

CANNING GREEN PEAS, ETC.

J. B., Webb's Mills, N. Y.—1 Is there such a thing as a small machine for cutting sweet corn from the cob? 2. How are green peas put up in glass?

ANS.—1. Such a device is sold by the Higganum M'f'g Co., 189 and 191 Water St., N. Y. 2. Experience in putting up green peas in glass or tins, has generally been a failure. Canners formerly had a great deal of trouble in getting them to keep, although they would boil them in cans for five hours, and they lost a large percentage of them. The plan now adopted by them, is to put the cans or jars into strong iron tanks having adjustable covers, which can be fastened down and made steam-tight. They then turn on super-heated steam, and keep the cans at a very high degree of temperature for half an hour. This process answers perfectly; but could not be used unless on a large scale. Green sweet corn is cut from the cob by the small canners by using a knife with a very thin blade, which is kept perfectly sharp, and the corn is cut off the same as a boy whittles a stick. Care should be taken not to cut too closely, as one should cut the grain leaving the hard stem on the cob. Machines used by large canneries, consisting of knives, springs and scrapers, are very expensive. Green corn requires thorough cooking in the cans to make it keep.

TREATMENT OF COWS THAT GNAW WOOD.

A. H., Castile, N. Y.—Why do cattle gnaw wood?

ANSWERED BY DR. F. L. KILBORNE.

This habit is not infrequently acquired by cows, and may be the result of several causes. Probably the most common cause is a morbid appetite or a deranged digestion, due to want of proper food, irregularities in feeding, pregnancy, exposure or other faults in the care and management of the stock. In many cases it is evidently an act of pure wantonness, simply a desire to be doing something. Animals kept too closely confined often gnaw the wood-work within reach, apparently to pass away the time. Examine into and correct the management and diet if found at fault. Then give each cow one-half pound of Epsom salts and common salt, and one ounce of ginger, to unload the bowels. Repeat the dose in 16 or 18 hours if the first produces no effect. For large cows not with calf this dose may be increased by one-half or even doubled. After the bowels have been moved, give two tablespoonfuls of the following powders in the feed, night and morning: Powdered gentian root and ginger, each one-pound; pulverized nitrate of potash and nux vomica each one-half pound; mix. Allow free access to salt and plenty of good drinking water. Exercise in suitable weather is also very desirable.

OLD AND NEW-PROCESS OIL-MEAL FOR DAIRY COWS.

D. F. C., Sandwich, Mich.—What is the difference between old and new-process oil meal and which is the better for dairy cattle?

ANS.—Old-process meal is the ground residuary cake left when the oil is extracted from flax-seed by severe pressure. On an average, it contains about 12 per cent. of free oil or fat; 30 per cent. of nitrogenous compounds and 37 per cent. of carbohydrates. New-process meal is the residuum when the oil is extracted from the flax-seed by means of naphtha or benzine, the latter being afterward expelled by high heat. On an average, it contains about 2.5 per cent. of oil or fat; 36 per cent. of nitrogenous compounds, and 34 per cent. of carbohydrates. The old-process meal, owing to the large proportion of oil it contains, is injurious to butter unless fed to the cows in very small quantities as part of a ration. The new-process meal is better for dairy cows owing to its lower oil and higher nitrogenous ratios. Either should be fed in connection with other foods, such as middlings or corn-meal, straw and hay. Unless the cows have plenty of some succulent feed, it would be better to mix the meal with boiling water and allow the mess to stand a few hours.

OVER-FED HOGS.

C. F. W., Adair, Mo.—As I was feeding my hogs the other day, one of them suddenly fell over and became rigid and insensible, but recovered in about five minutes and finished his meal, but the next morning he had lost all use of his hind parts as though they were paralyzed. He eats and seems to be in no pain except when he tries to move. What ails him and what can be done to help him?

ANS.—If the hogs are fat, the trouble is probably due to injudicious or over-feeding. Place the affected hog in a comfortable yard or pen with a dirt or ground floor. Reduce the feed one-half or two-thirds until he recovers the use of his limbs. Make a thin paste of ground mustard and turpentine and apply it to the whole region of the loins, and cover with a blanket for a few hours. Supply a mixed diet, with little or no corn for the present. You should have mentioned the condition of the hogs, how they have been kept and fed, and the feed, if you desired a definite, satisfactory answer. Under the circumstances we have been obliged to take some points for granted, instead of knowing the actual facts in the case.

GOITRE IN A HEIFER.

L. T. S., Quincy, Ill.—About three weeks since a swelling as big as a fist appeared under the jaw of my two-year-old Jersey heifer. Now it has extended upwards as far as the ears on both sides of the head. It does not appear to affect the health of the animal. What is it and what should be the treatment?

ANS.—It is a case of goitre, for which iodine given in small doses for a long period affords the only relief. This disease appears to be constitutional and hereditary, and the tendency to it may be transmitted from parent to offspring. In many cases it is due to the use of water containing magnesia in solution, derived from the soil. The only effective treatment is to give iodide of potassium in three-scruple doses daily for a long time, and apply iodine ointment to the swelling, rubbing in a piece as large as a chestnut once a day.

REMEDY FOR HARD-MILKING TEATS.

S. G. S., South Livermore, Me.—I have a valuable Jersey heifer that milks quite hard in the forward teats. Is there any way by which the orifice or milk channel can be enlarged?

ANS.—After each milking insert a hard rubber or lead plug, slightly larger than the opening in each teat, and allow the plugs to remain until the next milking. As the opening enlarges, a larger plug will be necessary. The upper end of the plugs should be rounded and slightly enlarged—probe-pointed. This will probably keep them in position, especially if the rubber plugs are used. If not, they must be made longer and V-shaped, the length of each arm being about three-fourths that of the teat, and there should be an eye in the end of the outside arm for a tape to be tied around the teat. Do not tie it too tightly.

WARBLES ON CATTLE.

L. R. H., Dighton, Kans.—What is the best treatment for grubs or warbles on the backs of cattle?

ANS.—Warbles are the larvæ of the gad-fly, and are to be found in little rounded tumors the size of hazel-nuts, on the backs of cattle in winter and spring. In the center of each tumor is a little hole through which the grub may be seen and extracted. The best treatment is to examine all cattle in winter or spring and squeeze out the grubs found in their backs, enlarging the openings with a knife when necessary. This cuts off the supply of flies for the following year, and if the practice were universally followed, the pests would soon be exterminated.

THE USE OF LIME.

J. F. C., Glencoe, Minn.—I can get air

slaked lime for 25 cents per barrel; would it pay to put it on corn in the hill after planting or after the first hoeing; or would it pay better as a top-dressing on fall-plowed land to be sown to wheat the following spring?

ANS.—The R. N.-Y. opposes the use of lime as a *fertilizer*. It acts as a stimulant by hastening the decomposition of plant food already in the soil. It *adds* nothing to fertility, unless the soil happens to be deficient in lime, which is improbable. Lime in connection with manure may or may not be profitable. We should not use lime alone unless we were willing to skin the soil.

A DESIDERATUM.

D. D., Farmingdale, Ill.—Is there any machine designed to scatter powdered substances thinly and evenly over the ground or, in other words, to scatter flour poisoned with Paris-green or London-purple over a potato field. The Woodason bellows do it too slowly. What is needed is something like a broad-cast seeder.

ANS.—The R. N.-Y. has not learned of anything of the kind that has been at all successful. It does not seem probable that such a machine could be made to throw a dry mixture accurately. The Field force-pump answers for liquid poisons.

PIGEONS.

J. D. G., Port Arthur, Ont., Can.—How should pigeons be fed and kept? Are there any works on the subject?

ANS.—There are three good works on pigeons. One is a finely illustrated book with colored plates, called "Fulton's Illustrated Book of Pigeons" 50 colored plates, $8.00. Another is an English work also finely illustrated, called "Pigeons," by Tegetmeier. The best practical cheap work is by Lewis Wright, "The Practical Pigeon Keeper," price $1.50. The first and last works can be had of the Ferris Publishing Co., 481 Broadway, Albany, N. Y.

Miscellaneous.

J. L., Factoryville, Pa.—Wm. A. Wood is located at Chattanooga, Tenn.

S. F. B., Patchin, N. Y.—A "good patent calf-feeder" can be purchased of J. B. Small & Co, Boston, Mass.

Several Subscribers.—We understand that Cornish, Curtis & Green, of Fort Atkinson, Wis., supply an outfit for testing milk by the method devised by Prof. Short.

P. E. V., Jerseyville, Ill.—Where can I get the RURAL No. 2 potato?

ANS.—From either Peter Henderson & Co., and Thorburn & Co., of New York; T. C. Davenport, 124 Dock street, Philadelphia, Pa., or Frank Ford & Sons, Ravenna, O.

Subscriber, Elva, Va.—Which is the most profitable willow to grow for sale, on moist river flats, liable to over-flow, and where can cuttings be bought?

ANS.—The Osier Willow is the one generally grown. We do not know where cuttings can be obtained; probably of any grower. This subject was discussed on page 364, of the last volume of the RURAL.

O. K. T., Lebanon, Conn.—Is the Japanese hybrid catalpa advertised by W. Atlee Burpee & Co., hardy enough to resist the winter climate of this section?

ANS.—We can not speak of this tree from experience, never having grown it. In what way it is superior to the Hardy Calalpa (C. speciosa) Mr. Burpee's announcement does not record. The latter will endure your climate.

G. S., Chautauqua, N. Y.—What are the relative values of bone-meal made; 1, from slaughter-house bones; 2, from Chicago steamed bones; 3, from horns and hoofs only? What would be needed to make each of these a perfect fertilizer for bearing grape-vines on a sandy-loam soil rather run down?

ANS.—A loss of nitrogen attends the steaming of bones. Choose first, No. 3; second, No 1; last, No. 2. Add two to three per cent. of nitrogen and five per cent. of potash.

W. C. M., Blackstone, Mass.—1. Will pop-corn "mix" with other varieties of corn? 2. Is Dunlap's Marrow among the earliest and best of fall squashes? If not, which is the earliest?

ANS.—1. Pop-corn will mix with *any* other variety that blooms at the same time. We have ears of pop-corn containing both sweet and several colors of field corn. 2. White Bush and Yellow Bush are the earliest we know of. Dunlap's Marrow the R. N.-Y. has never raised.

F. H., Union Hill, Ill.—Are there tree forms of the gooseberry and currant, and if so, has a nursery in Lamars, Iowa, really got them for sale?

ANS.—Any of the more erect-growing currants or gooseberries may be grown into a miniature tree form. The suckers must be destroyed from time to time. The best way to secure the tree form is by using the Missouri currant as a stock. We have seen both currants and gooseberries grafted on stems of that species, six feet high. We do not know as to the nursery inquired about; but we have seen a considerable number of complaints with regard to its dealings.

W. H. A., Clyde, N. Y.—My 32x36-foot wagon-house has an earth floor which is not altogether satisfactory, as the dirt will stick to the boots; what would be the cost of asphalt for a floor, and how should it be put down? Would the services of an expert be needed?

ANS.—Asphalt for the purpose mentioned will no doubt give excellent satisfaction; but will probably cost 25 cents per square foot. The material necessary and full directions for applying it can be had of the Neuchatel Asphalt Co., Astor Place, New York City. We would not recommend any mixture of coal tar and gravel, as so far as we know, poor results have always been obtained with this material. We are of the opinion that a good road gravel thoroughly rammed in place would not be open to the objection raised by our correspondent.

E. P. N., Nichols, Conn.—1. I have some asparagus roots from seed sown in 1888. They are rather thick in the row; which would be the better plan—to set them out in the field next spring or let them remain in the seed-bed? 2. Is there any public library in New York city which contains the statute laws of the various States, particularly those of Kansas and New Jersey?

ANS.—1. Is the seed-bed to be the permanent bed? Then, by all means thin out. If the plants are to be transplanted to a permanent bed, then we should let them remain in the seed-bed until that time. 2. Probably the Astor Library contains the published laws of the various States; but old laws are constantly being changed or repealed and new ones are passed, so that it is very unlikely that a complete list of all the laws in the various States passed to date can be found anywhere in the country. Probably the most likely place to find such a work would be the Law Library, of the Equitable Life Assurance Society, 120 Broadway, New York.

J. B. L., Maysville, Ala.—1. My eight-year-old blue plums bloom profusely every spring, but bear no fruit; why, and what should be done for them? 2. How late can parsnips, salsify and beets, be planted here?

ANS.—1. There are well known instances of plums bearing imperfect blossoms, in which case fruit can not set unless the deficiency is made up by the contiguity of other trees. It is thought, also, that in some, the pollen does not mature when the stigmas are receptive. 2. Much depends on local circumstances. If salsify is sown in spring, a hot, dry summer may arrest its growth, and a genial, moist fall may excite a vigorous second growth and cause many of the plants to bloom, which would greatly impair the quality of the roots. But as salsify needs a long season of growth to mature good roots, a sowing may be made in late spring, and the main sowing after the first soaking summer rain. Spring-sown parsnips are good for use in late summer and fall, but parsnips for winter should not be sown till after a soaking summer rain; indeed, if not sown till the first of August we may expect good roots, as they can remain and grow in the ground till Christmas, or all winter. Sow long beets early in August; turnip beets, in August or the first of September.

DISCUSSION.

HIRED LABOR IN THE PIEDMONT BELT OF S. C.

J. C. S., PENDLETON, S. C.—Our hired labor here is entirely different from any mentioned in the RURAL. Nine-tenths of it comes from colored natives. Wages are $5 to $7 per month for boys, and $7 to $10 for men, and all get 12 pounds of meat, one bag of corn-meal, one gallon of molasses and three pounds of salt for rations, which now amounts to about $2.25 in addition to the above wages. Our help is generally hired from our tenants on our own or adjoining farms, and we are not bothered about boarding and washing for hands, save board for one select hand who takes his meals in the kitchen instead of rations, and does chores about the house and barn morning, noon and night every day and Sundays, too, though all the regular monthly hands join in helping about the barn except on Sundays when our select hand "Friday," picks up one or two boys that are nearly always passing or hanging around, to help a little just for the privilege of riding the "boss's" horse to water or a chance morsel from his table. Our man "Friday" is generally the best all-purpose hand on the farm and holds the balance between the household and farm, and the cook (who is generally colored) has about as much control over "Friday" as the "boss" has, for "Friday" thinks as much of his eating as he does of his wages. And when "old miss"—the mistress of the house—speaks to him, her word is law with him, for he will stop anything for her, to whom he looks continually for nick-nacks, and who gives him now and then a cast-off garment that the "boss" used to wear. Our regular force of hands are hired for the year, and it sometimes happens that we do more work during a dry winter than during a wet spring. Our climate admits of profitable farm work all winter except during exceptional spells of continued wet weather. We pay for our day labor 40 cents to 50 cents for ordinary field hands, and 65 cents to $1 for harvest hands, and the hands generally board themselves. Written contracts are seldom drawn up. The better plan and the only one to insure the farmer in his busiest season is to reserve part of the wages, and this is best for both, though some object, and give their reasons by saying that they might die before the year was out, and in that event they would be deprived of the benefit of part of their wages. They evidently believe in administering on their own estates. The drift of the hired young men is to marry (but few married men hire by the year) and to rent, or, as they call it, "run a farm," which with good management never fails to bring a man better returns for his labor; but unfortunately for him he has but little knowledge of frugality and with his increased income come temptations to live more extravagantly, and, as a rule, when working for himself he has no more money to save than when he worked for wages, though a few men buy a few acres to call a home, but continue to rent land and travel long distances to work, which makes their home a source of inconvenience to them, whereas by the usual plan of renting they have just as good homes free of charge near their work. Cheap labor is too much on the order of the monkeys which were imported by a cotton planter to pick cotton, who after a time reported a success so far as getting the animals to pick cotton was concerned, but the financial part was a failure as it took two men to make one monkey work. So it is with our poor class of laborers; they are not usually paid less for a day's work, but they are not wanted, and are never employed when it can be avoided and they float around from place to place hunting work.

Altogether, our colored labor is the best that we have tried, and when properly managed it is efficient for all common work on the farm; but is is generally lacking in intelligence on the stock, fruit and vegetable farms where it is necessary to pay higher wages to more intelligent white labor, but this class of white labor does not stay with us long, as the men soon learn the value of their better judgment and management and leave us to rent land, hire and utilize our cheap labor for themselves, and soon become land-owners or large farmers on rented land. To my mind there is not another section of our country where cheap lands and cheap efficient labor are to be found together, or where good management gets a better premium or poor management is so general. Our colored laborers are good workers, but poor managers, and unless the farmer is with his hands all the while he cannot expect good, fore-handed work, and when I hear one abusing negro labor I am at once convinced that he does not know how to manage this labor, or is too lazy himself to go with his laborers; and when I see a white man past 25 years of age, who has been in this section long wanting work on the farm for wages, I know at once that there is something lacking in his make-up to make a first-class farmer, and if I were to hire him I certainly would not expect to get a man with good judgment and management, for if he had such qualifications he would not at that age be in such circumstances as to seek work at farm wages.

WORDS OF CHEERING APPRECIATION.

W. B., DAYTON, OHIO.—Among the editorial items in the RURAL of January 12, is the remark that "the subscribers of the R. N.-Y. are, more and more, with each succeeding year, of the more intelligent, progressive, alert, well-to-do class." Well, for my part, I cannot see how it could be otherwise. Any wide-awake farmer of to-day, who is a RURAL reader, must take an advanced position among his co-workers, as certainly as the sun shines. Under the RURAL's practical teaching, assisted by the most eminent corps of horticulturists, agriculturists, and writers in all other pursuits pertaining to agriculture, no other result could be expected. There is not an agricultural college in the land capable of employing such reliable talent, nor is there any institution under State or Federal auspices able to inspire its pupils with the confidence every reader has in the RURAL'S every-day, practical and wholesome lessons. No subject can be agitated with regard to which it cannot bring forth teachers whose experience has taught them the best way to success, and the best means of avoiding that which is unprofitable. Particularly do the special numbers contain the very essence of the practical ideas of many whose reputations have become national and to whom we are only too willing to look for instructions in some particular branch of farm work. Not only does the professor, but also the every-day worker, gladly assist in extending knowledge for the betterment of every one who wants to learn. Here we are taught how to economize to get better results with less labor and expense, as well as to adopt and practice new ideas; while each is told how to experiment for his own purposes. There are, of course, some who know everything, and to whom an encyclopedia would be an incumbrance. These the RURAL could not assist, and as a general thing they are the people in whose fields and fence corners the rankest weeds grow; who see no use in sheltering the plow or harvester, and who deride the tiling of land as a useless expense. Nature sometimes does assist such, and they get along; yet how much more could they have prospered had they assisted nature a little. I have yet to hear of the failure of one who has taken up a certain branch of farm work, and pursued it intelligently and persistently; while I know of many failures where persons have tried to engage in and prosecute every branch of farm work, such as running a dairy, gardening raising cattle, and practicing all sorts of farming at once. In such cases one or more of the different interests will suffer, and eventually, in nine out of ten cases, the profits of all will disappear. Against such mistakes as these the RURAL is continually cautioning its readers, and in this way it shows good hard sense, and an evident intention to do nothing that might cause hardship among the agricultural community. It is this that is drawing thinking farmers and all others interested in out door pursuits increasingly towards the paper, as each year shows more plainly the earnest desire of its Editor to benefit the public regardless of cost or favor.

STEELE'S RED WINTER APPLE.

T. T. LYON, SOUTH HAVEN, MICH.—In the RURAL of February second, at page 71, replying to L. A. E. of Vermont, the fact is stated that the Baldwin apple and also the Red Canada are known by the above synonym. The statement made by the inquirer, that the cions growing in Vermont were received by him from Michigan, renders it almost if not absolutely certain that they are genuine Red Canadas. I have never known or heard of a case in Michigan in which the name Steele's Red Winter was applied to the Baldwin; and I very confidently express the opinion that even in New York where the synonym had its origin, the name Baldwin is no longer applied to that fruit, save that when Western planters sending to New York State nurseries for trees of Red Canada, mistakenly call it Steele's Red Winter, the orders are filled with Baldwins.

A brief explanation of how this synonym came to be applied to the Red Canada in Michigan, and from there found its way to many other Western localities, seems proper in this connection. Sixty or 70 years since tramping grafters, from Ohio, grafted a tree in a large commercial orchard near Plymouth, Michigan, with cions of what purported to be Rhode Island Greening. On coming into bearing, the fruit proved to be an unknown brilliant red apple. It was placed in the cellar, and, during the ensuing winter, was shown to a visiting friend from Western New York, who identified it as Steele's Red Winter. Coming from a region where the Baldwin was, at that time, known by this name, he evidently supposed the apples to be Baldwins. The fruit rapidly grew into popularity in the vicinity, under this name; and was widely distributed from this orchard, by grafting upon the numerous seedling orchards of that early day. In this manner both the fruit and cions were very widely distributed through this and adjacent States always as Steele's Red Winter, under which name it acquired great popularity in the markets of Detroit, Chicago and other Western cities. When, about 1847 to 50, the writer planted extensive trial orchards at Plymouth, Michigan, he included this variety, and at the same time planted trees of the true Red Canada under that name. When the trees came into bearing the discovery was made that they were identical. Specimens were at that time sent to the late Charles Downing, who found them so superior to those he was accustomed to see, that he hesitated for a time to acknowledge their indentity. Specimens of this variety of the previous year's growth were shown at the opening of the Centennial Exposition at Phil-

adelphia, and it was one of the varieties upon which Michigan won the meed of superiority for its exhibit of long-keeping apples.

ANOTHER TEST FOR MILK AND BUTTER.

C. F. O., DARIEN, CONN.—I have tested the weight of milk, cream and butter, obtained from one of our average churnings. Five milkings furnished 242 pounds of milk, from which we got 63½ pounds of cream and 12 pounds of butter, so that there were 20 1-6 pounds of milk to one pound of butter. The above is the result from 12 cows, four of which are due to calve within the next eight weeks; four are farrow, and two are to calve before June 1st. They are grade Jerseys, from four to ten years old, and are fed a mixture of two parts of corn-and-cob meal, one part of oats, two parts of wheat bran, one part of cotton-seed meal and one part of linseed meal; they get two quarts mornings and two quarts nights, dry. Then we cut corn-stalks and hay three-quarters of an inch long, mix them and feed each cow one bushel four times a day, as follows: One bushel before milking in the morning; then each gets the ground feed, and then another bushel of stalks and hay. About 10:30 A. M. they are let out in the yard, where they stay till about 3 P. M., when they are put in the stable and fed a bushel of stalks and hay. Then, before milking, they get their ground feed, and after milking another bushel of stalks and hay. They do not get warm water, but what they do get is drawn from a cistern under the barn just before the cows are let out. We try not to let any water stay in the troughs to freeze, as we do not think ice-water quite fit for cows to drink. They are carded every day before they are let out. As soon as possible after milking, the milk is set in a Cooley creamer. The cream rises in 12 hours, and is kept sweet till the night before we churn, when it is all ripened together. It is churned in from 30 to 40 minutes in the Davis swing churn at a temperature as near to 68 degrees as possible. It is washed in three or four waters when in granules, and salted with Higgins's salt—one ounce to the pound. The salt is lightly worked in, and then the butter is set away for 24 hours. Then it is worked dry with the Eureka butter-worker, then printed in half-pound cakes and sent to New York, where it sells for 60 cents per pound. I believe if I had silage or roots to feed, I could feed more cheaply, but as this is my first year here, we have not things in proper working order yet. This, together with the misfortune of having two barns with *all* our crops burned, puts us in bad shape for a record of any kind this winter.

ORIGIN OF THE POTATO, ETC.

L. H. R., RUTLAND, VT.—A recent article entitled "Whence came the potato?" in the Vermont Watchman, makes several statements with which I cannot agree. Among others, it assigns the origin of the tuber to China. If I am not mistaken, the potato is found in a wild state in many sections of Mexico and in Arizona and Colorado to-day. Geo. Pinney of Evergreen, Door Co., Wis., introduced last spring, a new variety of potato which he claims came from the cultivation of a wild variety procured either in Arizona or New Mexico, I have forgotten which. As to the potato having been grown in China from time immemorial, has anything ever been found which was not an old thing in China, according to the claims of some? I wish the RURAL would have another Potato Special this winter, as I think it has done an immense amount of good by its many experiments with potatoes. I consider the potato one of our most valuable crops, and if every one would wake up to the idea that the older varieties, like the Early Rose and Early Ohio, had seen their best days, growers might double their crops by keeping up with the times and growing the newer and better-yielding varieties of recent introduction. Among other varieties, those that have proved especially valuable with me, are Early Albino, New Queen, Hampden Beauty, Sunlit Star, Polaris and Rising Sun, for early; Summit, Everitt and Rose's No. 74, for medium; and Green Mountain, Delaware, Alexander's Prolific, State of Maine, Bonanza, Morning Star, White Lily, Empire State, Thunderbolt, Tioga Point, Newton Seedling, Chautauqua Seedling, and Fearnaught, for late or main crop varieties. Of the novelties of this season Rogers's Seedling and Tenhocks for early, and Ben Harrison and Burpee's Superior for late, are very promising and are worthy of an extended trial.

R. N.-Y.—In so far as the RURAL's information goes, the potato is a native of the Andes of South America, and also of Arizona, New Mexico, and other parts of Western North America. Whether it was found in the East prior to its discovery here, will be a pretty difficult problem to solve.

"LIMA BEANS WITHOUT POLES."

STODDART, NEW YORK CITY.—I have used a device for raising Lima beans and other creeping plants, even tomatoes, similar to that described by E. T. Ivy in a late RURAL; but, instead of common wrapping twine, I used a sort of hempen cord tarred and prepared for fishing use, which I purchased from a dealer in fishing tackle. It was not expensive and has proven indestructible by wet and inaccessible to rust. It also possesses a certain stiffness which facilitates the undoing of the vines without destroying or cutting the twine, after the plant has wilted, and so allows the use of the same twine year after year without removing and replacing it in fall and spring. It is easy enough to draw it taut whenever and wherever required, and the labor of putting it up as well as the expense of new twine is saved. In tying plants on walls or fences I drive in galvanized staples or galvanized nails. On brick walls the nails are better, but on fences I prefer the staples. In training tomatoes against a fence I tie southern reeds about a foot apart horizontally into the twine netting along the wall. They are sold about eight feet long for $1 per 100, and, if carefully handled, they may be used over and over again. Short sticks or rests fastened to them and against the wall will keep the vines and fruit at a sufficient distance from the wall or fence to allow tomatoes to spread without hindrance. In this way I saved space in a small garden spot and made vegetables serve as ornamental plants in the place of morning-glories and other little weeds.

WILL BONE ANSWER?

D. C. L., CRANBURY, NEW JERSEY.—I notice what A. T. T. of Franklin Park, N. J., says on page 90 of his experience and that of his neighbors for 30 or 40 years of the effects of lime applied to their land. His article would lead me to the conclusion that the exhausting process has been going on all these years. I believe it is conceded that lime represents no plant food—it merely prepares for use what is already in the soil. In speaking of his own use of fertilizers, he refers to bone, or it may be a plain superphosphate with a small percentage of ammonia and potash. Is not the proper inference to be drawn from his experience that the nitrogen and potash in the land have, in that vicinity, been exhausted in a degree, and while the farmers may apply "bone" in large quantities, thereby largely increasing the phosphoric acid, yet if the ammonia and potash are not applied through yard manures in sufficient quantities, can they look for any other result than partial failure of crops? This question of keeping up the balance in our soils, to insure average crops, is one of vast importance to the farmer. I believe it cannot be done with lime and bone, or the ordinary superphosphates.

WATER FOR FATTENING ANIMALS.

J. B. P., NEW LONDON CO., CONN.—On page 89, in Mr. Henry Stewart's answer to questions relative to the fattening of steers, he states that they should be "well supplied" with drinking water of a moderate temperature. This "moderate temperature" would increase the palatability of the water, causing them to drink more than they otherwise would. But to come to my point: In Prof. H. P. Armsby's book on "Cattle Feeding," which is considered a standard book, we are told that "excessive drinking of water increases the consumption of both fat and protein in the body." He cites several experiments which go to prove his statement. This increase of consumed fat and protein goes from the body as waste matter, while, but for the excessive amount of water drank, it would have remained in the body as so much toward the desired end, *i. e.* the production of a fat animal. To avoid this extra demand for water, conditions must be adopted to annul the wants of the system. Thus, to quote Prof. A. again, we must avoid "too watery fodder, too high temperature of stall, two much salt, etc., and, withal, remember to keep the animal as quiet as possible."

J. P., FITCHBURG, MASS.—I have never known an egg to be eaten by any of my hens since I adopted for a nest a nail-keg or its equivalent, nine to eleven inches deep. A hen may break an egg in such a nest, but she cannot get into a position that permits her to eat an egg.

What Others Say

OPEN AIR AND SUNLIGHT FOR CATTLE.—OUR highly-valued contemporary, the Weekly Press, gives some forcible reasons why cows should have regular exercise in the open air and sunlight. Sunlight and pure air are essential to health. They are among the most important blessings we enjoy, and nothing in the animal or vegetable kingdom can thrive without their influence. A sun bath is a positive luxury to every animal from man down. Watchmen and others who have to spend the night hours on duty and sleep in the day-time soon suffer in health, and, unless relieved by a change, break down. Exercise is just as important to animal vigor as pure air and sunshine. We should bear these things in mind when we talk of keeping our cows confined to the stables for months together. Cows so confined may give just as much, possibly a little more, milk than if allowed exercise, but they certainly must deteriorate in vigor and become fit subjects for tuberculosis and other diseases. The ill-effects of this enervating treatment, if not very marked in the present generation, must show themselves in the offspring. There is no earthly reason why exercise is not just as essential to the health and well-being of a cow as to that of a man or a horse. Giving milk is a drain on a cow's system, but it will not take the place of exercise; in fact, the cow needs the exercise all the more to strengthen her for the demand upon her constitution. Some cows endure close confinement better than others, just as some men enjoy an indoor life that would be intolerable to their more active fellows of a different temperament, but that does not make the indoor life healthful; it is only a matter of degree. In the writer's own dairy the majority of the cows become very restless as the hour for release from the stalls approaches, and the capers they indulge in when turned into the shed yard for a frosty morning show that they appreciate the advantage of having a chance to stretch their limbs.

EIGHTY-CENT BUTTER.—E. F. Bowditch is a wealthy farmer of Framingham Center, Mass. He makes 80-cent butter and can readily sell at that price more than he makes.

The Mirror and Farmer, a Journal published in Manchester, N. H., tells how his butter is made. There is no secret about Mr. Bowditch's butter. He tells the public everything there is to know about the cows, and the cream manipulations. R. N.-Y. readers will remember what has been said in these columns as to his herd of Guernseys, numbering 19 and averaging 8⅓ quarts of milk a day.

They are fed four quarts of corn-meal each in two feeds, morning and night, and all the Timothy hay that they can eat. The milk is strained seven times before it is placed in the cans of a Cooley Creamer, once being run through four thicknesses of cloth. It sits from 12 to 24 hours, the latter period being in the summer and the former in the winter. Twenty-four hours are allowed for ripening.

At present, churning is done every other day. The cream from two days' milk is placed in a pail and warmed up to 80 degrees, being then placed in a warm room for 12 hours, the temperature of the room being about 60 degrees. After remaining there for that length of time, all night, it is churned in the morning in a Davis Swing Churn from 30 to 40 minutes. After the butter comes, several pailfuls of water at 45 degrees, are poured into the churn and the churn is given a few swings and then allowed to remain at rest for a few moments when the butter-milk is drawn off and the churn filled with water and the previous process of swinging and resting repeated. The butter is washed three times, the last time in brine, the strength of which is that obtained by putting a pint of salt into two pailfuls of water. Then the butter goes to the butter-worker, a Eureka, when it is salted in the granular form, one ounce to the pound, Ashton's salt being used. The salt is raked in with a wooden rake. The butter is then placed in a tin box, a clean cloth being used to prevent the butter from coming in contact with the tin, which causes sticking. In this box, tightly covered, the butter remains 24 hours, when it is worked into half-pound pats, pressed with a Rapp press into bricks, wrapped with clean cloth, placed in a refrigerator and soon thereafter sent to market. At present 105 pounds of butter are turned out each week. The creamery in which the butter is made, is cemented on the bottom, double-walled and kept scrupulously clean. Mr Bowditch has a very large farm, in a superior state of fertility, handsomely and conveniently appointed, with buildings, fences, etc., and stocked with fine blood animals. Mr. Bowditch served his apprenticeship as a hired hand on a farm; his employer never suspected during the boy's faithful term of service that his young assistant was a child of wealth. This practical spirit has followed Mr. Bowditch all through life, and has made him familiar with all the details of "Millwood Farm." It is that kind of spirit that enables him to turn out 80-cent butter.

SORGHUM EQUAL TO CORN FOR STOCK FEED.—DR. PETER COLLIER, in an address delivered before the Farmers' Club of Elmira, as reported in the Husbandman, pointed out that the nutritive value of corn and sorghum is practically the same.

It is obvious, then, that for every purpose for which corn is used, sorghum seed may be substituted; and, in fact, Dr. Collier has abundant testimony that sorghum seed has been so used. For example, at Rio Grande, 500 head of hogs were fed and fattened upon sorghum seed. The late Col. Aiken, of South Carolina, assured him that for 25 years he had always grown sorghum enough to furnish feed sufficient to fatten his swine, and that for the seed alone he regarded sorghum as far superior to corn in his section of the country. Now, our corn crop is the cereal of this country. The yield for 1888 was almost exactly two thousand millions of bushels. About 38 per cent. of all the cultivated land of the United States, even including the grass land, is devoted to corn. While we of the East make much account of the stalks for increasing our stock of rough fodder, it is probable that at least 90 per cent of these stalks are regarded throughout the Prairie States of the West, where the bulk of corn is grown, as a nuisance to be got rid of in the easiest way possible. Corn, therefore, with us, is grown, we may say, almost solely for the grain which it yields. The average acreage yield of the United States for 25 years has been about 27 bushels. It is interesting in this connection also to observe that 95 per cent. of our corn is consumed within the country, and for several reasons for which it is used, sorghum seed, were it produced, might be in every case substituted. Now, again, while much yet remains to be determined in regard to the character of the soil best adapted for the sorghum plant, it is generally accepted that any land which is suitable for corn is also adapted to the cultivation of sorghum: in fact, that the demands upon climate and soil of the two crops are practically the same, with this important difference, however, which is in favor of sorghum, namely, that no crop will stand as severe drought as sorghum Indeed, a few years since, on the northern Atlantic sea-board, the corn crop was practically a failure: over thousands of acres not a bushel of corn per acre was harvested; and yet that very season sorghum was found to be unusually rich in sugar, and the only effect produced by this prolonged drought was to diminish the crop of cane to the extent of about 25 per cent.

The cost of cultivation of the sorghum is practically identical with that of corn, but Dr. Collier thinks that if a quarter more labor were given to it, the improved character of the crop would justify the additional expense. The grain of sorghum may be prepared for market or for feeding at an expense no greater than attends the cost of harvesting corn. The average of seven extended estimates as to the yield of sorghum, and one of these estimates included returns from 21 States, gives an average yield of 29⅝ bushels of seed per acre. We may, then, safely conclude that inasmuch as it pays to grow corn in this country for the seed alone, so too will the seed of sorghum pay all the expense in the cultivation and harvesting of the crop. Indeed, says Dr. Collier, there is abundant testimony to prove that such is the case.

ROAD IMPROVEMENTS IN NEW JERSEY.—Efforts are being made to reform the present system of road making in New Jersey. The road laws, according to Bradstreet's, are now being revised and codified by a committee of the State Board of Agriculture, which will recommend, among other things, the abolition of the office of road-overseers. The feeling seems to be general that the road-overseers have been obstacles in the way of road improvement. Another change suggested is the taking of the authority over the roads from the towns, and vesting it in the county authorities. One plan brought forward at several local meetings, contemplates empowering the Board of Freeholders to select and improve the important roads, and thereafter control and repair the same, sharing the expenses of the work between the counties and the municipalities through which the roads run. Road improvement should be taken up in a like vigorous and intelligent way in other sections of the country.

THE LATEST AND BRIEFEST.

Mr. E. H. Libby says that the would-be philanthropist can benefit his fellow men of all sorts and conditions in no better way than by building them a good road. His memory

will be revered after he is gone, and if there is any trust in the belief that the good-will of those left on earth will benefit those who have gone, his path through eternity will be made as smooth as good wishes and friendship can make it and his act go far to atone for wrong-doings.....

THE GARDEN, through Mr. William Falconer, gives a very interesting practical note respecting celery. Mr. Grant, of Mamaroneck, grows celery in the good old English way, two rows to the ridge. Late in the fall he banks them up high, and on the tops of the ridges lays a A-shaped board cap to throw off rain and snow water, and over all a thick mulching of salt hay. In digging out celery he brings in a month's supply at a time and stores in a frost-proof shed. Celery kept in the ridges in this way is never apt to damp or rot off in winter, as is often the case with celery that has been lifted and stored in trenches. But, then, while we can get along very well with this method in a moderate way, it would be impracticable on a large scale. Mr. Grant is emphatic in praise of Major Clark's pink celery, and declares that it surpasses in quality any other variety he grows. Mr. Falconer, too, bears testimony to its excellence, for he has grown it for years; indeed excellence of quality is pecular to all our red varieties of celery. But many people object to the pink tinge in the leaf celery on the table, and to the dark color of pink celery when it is cooked. Appearance goes a long way in vegetables, as well as in fruit; indeed, the finest-appearing of all celeries—the self-blanching ones—are, Mr. F. thinks, the poorest in quality. .....

IT is not unlikely that there will be a good European market for American wheat in July and August if not earlier. .....

PROF. A. J. COOK believes when we take expense and all into consideration, buckwheat will pay a better profit than will wheat. But, aside from this direct profit, buckwheat has an indirect value. It is an excellent honey plant, and thus its production adds to the profits of the bee-keeper, and just so much to the wealth of the country. .....

JAPANESE buckwheat is just now attracting much attention, and many are inquiring as to its value. The past season Prof Cook tried it, and recommends it very heartily. He has stated in the R. N. -Y. and also to the same effect in the Albany Cultivator, that the berry is very large, and the plant is astonishingly productive. All who have examined the plant say that they have never seen anything to compare with it. .....

To add to the value of his experiment he sowed one-half of his field the first of June and the balance the first of July. Thus he prolonged the season of bloom, greatly to the advantage of the bees. He could see no difference in the productiveness of these two pieces. The early sown filled as well as that sown late He also noticed that the bees not only worked on it continuously, but all the day from morning until night It is a well known fact that bees do not usually work on common buckwheat after noon. Whether this peculiarity was owing to the variety or to the season, he does not know. He has tested the Japan buckwheat for griddle-cakes, and pronounces it superb.....

A PLAN of blackberry growing which Matthew Crawford says, in the Michigan Farmer, is very extensively practiced in the West, is to give the new plantation clean culture the first year, and seed to clover the second spring. This makes its growth before the berries are formed, and it draws lightly on the soil in the summer when the berries need all the moisture. It prevents a late growth of the canes and causes them to ripen thoroughly. The fruit is always clean and there is no growth of weeds. Mr. Crawford thinks that with pretty close pruning this method might work well anywhere.....

THE AMERICAN GARDEN has the following: "THE COMING POTATO.—The Rural No. 2 potato, which yielded at the rate of over 1,000 bushels in the famous "Rural Potato Contest" of last season, deserves a thorough trial by every potato grower. The phenomenal yield in itself, on the very rich soil of the test plot, may not be conclusive evidence of its phenomenal prolificacy, and the variety may not rise more prominently among our general-purpose varieties than did the Green Mountain, which a few years ago on the same plot yielded at the rate of more than 1,300 bushels per acre. But we have really made so little progress for several years in the improvement of potatoes, at least so far as varieties of the general adaptability of the Early Rose, Burbank, White Elephant and White Star are concerned, that every grower should be on the lookout for the "coming potato," may this be Rural No. 2, Monroe Seedling, Crown Jewel or any other not yet named. By the way, is the Bural No. 2 potato going to carry that euphonious name all through its life? Why not call it Contest or Carman? No. 2 is too suggestive of second-grade, when we want A. No. 1."

The R. N.-Y. No. 1 was sold to a seedsman several years before the No. 2 was sold. But the next season it developed faults and, with the seedman's consent, was given up. It was very early. The No. 2 was so named as being an *intermediate*. No. 3 not yet introduced, is later and No. 4 is late. It is a notable fact that the Nos. 2, 3 and 4 are all from the same seed ball. No. 2 is the shapeliest, but Nos. 3 and 4 were, two years ago, the largest yielders, in our rich soil plot, we have ever seen. Last year they failed on account of the injury inflicted upon the vines by the flea-beetle. The R. N.-Y. has determined, though well knowing the objections thereto, to introduce not only its potatoes, but its wheats under number-names.....

A RECENT decision of the New York City Court is to the effect that no recovery can be had even by a *bona-fide* holder, upon a note, check or draft which has been fraudulently altered by increasing the amount. Not only is this frequently done in notes given by farmers to various kinds of sharpers; but often the whole body of the note is fil'ed in. Such notes, it seems, should never be paid without recourse to the courts .....

"WHAT has become of the 'blue' gladiolus that was said to be in possession of Monsieur Lemoine, at Nancy, France, some time ago? Are we to have the real 'blues' in gladioli and roses or not?" asks the editor of the American Garden. Several blue gladioli have been originated during the past 10 years. But the corms do not propagate and dwindle away and die.....

ALL things considered, we should choose Moore's Early for the earliest black grape....

MR. PADDOCK, in Hoard's Dairyman, says that when he has sufficient cream gathered for churning, he heats it to nearly blood heat, stirring it occasionally while heating, so as to mix it thoroughly; then he sets it away to cool and lets it stand until the next day; then he warms it to about 65 degrees and churns. As soon as the butter begins to show like grains of sand he cools it at once, by putting a little cold water in it. For several years his wife has followed this plan, and the butter generally comes in pieces the size of a small pea in about ten minutes, seldom 15. He finds the butter much better than when he churned 30 minutes or more.....

JOHN BOYD says that refrigeration prevents the formation of acidity in the cream, especially if submerged; while stirring merely interrupts and retards, but does not prevent acidity. In fact the bad effects of stirring are so apparent that it astonishes him to hear men advocate the practice who claim to be not only practical, observant workers, but who lay claims to be in the first rank. It makes him think their butter-making is based more on theory than on actual work. This excess of theory has been the curse of the dairy business for years.....

MR. RAWSON says that onion seed should be thrown into water and that only those which sink are fit to sow.....

WE would respectfully inform our later friends (the older ones are familiar with the fact) that the R. N.-Y. offers nothing whatever for sale except the paper itself. The R. N.-Y. No. 2 potato was disposed of over two years ago (a single bushel) and is now in seedsmen's hands .....

DIRECT.

——N. Y. WORLD: "The Commissioner of Agriculture at Washington in a recent report declares that a well regulated system of public roads throughout the United States is daily becoming a great necessity and merits the earnest attention of Congress, and that while our railroad system has become the most perfect in the world, our common roads are inferior to those in any other civilized country. The road-tax system is characterized as a relic of feudalism, borrowed from the 'statute labor' of England, and its evil results are apparent in the neglected and ill-conditioned common roads of the country."

——WESTERN RURAL AND STOCKMAN: "If the whole people could be made to realize the fact that there is the largest sum of money in the hands of our government that was ever seen on earth, or probably ever will be seen, there would be an inquiry into our financial management that would come with the force of a cyclone."

——HOARD'S DAIRYMAN; "There are some things, about farmers' institutes, in Wisconsin,—they can't be any more lively, unless they run wild—which would be a bad thing to do; and they can't be any larger in most places, unless there is a general enlargement of public halls."

——PUCK: "Whence does the Trust derive its power? Mainly from the Senate of the United States. It is in that body, forbidden by the Constitution to originate measures affecting the revenue, that the customs tariff of the nation is practically shaped. There it is that whatever the House of Representatives may offer in the way of legislation is trimmed and clipped and cut and changed end for end, if need be, to suit the demands of the Trusts which have seized upon the business of the country. In that body, which was once supposed to represent the conservative sense of the nation, every measure designed to forward the prosperity of the people is turned into a law for the benefit of the Trusts"

"MORE honored in the breeches than in the observance—Slim Calves."

MR. BAND: "Grow less, but grow better."

——'CONFINE your efforts to a few varieties suited to your location; exercise skill to bring them to perfection; put them on the market at the proper time, honestly assorted in clean, neat packages, with the name of the variety and producer, so that the buyer will not only be attracted by the appearance, but educated as to the quality, and your success is assured, not only from a money point, but from the greater and higher mental satisfaction resulting from your labors."

——"FROM personal observation I do not doubt that the income from our orchards could be doubled by better management, and this consists chiefly in better cultivation, more manure, spraying, with arsenical poisons, careful pruning, and, above all, placing the fruit on the right market at the proper time."

——HOARD'S DAIRYMAN: "One reason why there is so much truth in the oft-reiterated remark,—'Farming don't pay,'—is, that there is not another business on the face of the earth that, in proportion to the number engaged in it, supports so many incompetents"

——COLMAN'S RURAL WORLD: "There is no freedom on earth equal to that of a man in this country who owns his farm and is out of debt."

——LIFE: "We have said that if all Americans were consistent in their Americanism, we could not be conceited enough; but, as Mr. Howells has pointed out, we are a race of snobs. We all have yet a sneaking reverence for rank and title, although we have demonstrated to the world that only where rank and title do not exist may the highest plane of manhood be reached."

——N. Y. HERALD: "A State Dairy School to instruct young men and women how to produce milk? Watertown would be an appropriate location for it."

As a Nerve Tonic

Use Horsford's Acid Phosphate.

Dr. S. L. WILLIAMS, Clarence, Iowa, says: "I have used it to grand effect in a case of neuralgic fever, and in uterine difficulties. Also, in cases where a general tonic was needed. For a nerve tonic I think it is the best I have ever used, and can recommend it most confidently."

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, FEBRUARY 23, 1889.

THE RURAL NEW-YORKER for 1889, will be, as hitherto, invariably, $2.00 a year for single subscriptions, and $1.50 in clubs of five or more.

Mr. Stewart on page 106 *says:* "*All rules for feeding are modified more or less by the character of the cows.*" *Don't forget this when studying the rations proposed by chemists.*

THE President has signed the bill making the Department of Agriculture an executive Department with a seat in the Cabinet for its head. Very properly the honor of being nominated the first Secretary of Agriculture in the National Government has been conferred on Norman J. Colman hitherto Commissioner of the glorified Department. The business of demonstrating that the change is likely to be beneficial to the greatest industry of the nation, and that there is a broader mission for the new member of the Cabinet must, however, fall upon the man whom President Harrison may appoint after the fourth of next month.

The "Parrot Painfully Pounded" on page 135

IF governments find it wise and necessary to suppress gambling dens which take money from the idle and the dissolute who have never learned any noble or proper use of money, how much more and how much stricter should be the suppression of that diabolical modern form of gambling which keeps the prices of grain and other necessaries of human existence in fluctuation, and always robs either the poor consumers by enhancing prices, or the struggling and ill-paid producers by suddenly lowering them. Our people, patient as they are, cannot long tolerate such monstrous wrong.

"*I believe it is conceded that lime represents no plant food—it merely prepares for use what is already in the soil.*"—D. C. L., page 126.

IF, as is reported, the proportion of farmers who attain an age of 80 or more years is 461 in a total of 1,000, and of farmers' wives 800, the figures do not show by any means that farm-house work wears out the women. Both women and men rust out faster than they wear out. The returns are said to show that out of 1,000 women over 80, all but 50 were busy house-wives. On comparing the looks and manners of ladies from town and country making purchases in a popular store the other day, a striking difference was manifest between the country women, ruddy with good health, lively in manner and vigorous in movements, and their pallid, distressed-looking, and slow-moving sisters from the close rooms of the town.

"*I believe if I had silage or roots to feed, I could feed more cheaply.*"—C. F. O, page 126.

IT is true that we see and hear comparatively very little of late years, of the pretty, lively birds that used to fill the air with warblings and chirpings more welcome to most ears and more pleasant to most nerves than the costliest piano thrumming. But whether the crows are the cause is very doubtful. They are as scarce here as any of the small birds have become. The children, however—bless them!—are sempiternally full of chirp; and they, and a canary here and there, are now the chief sources of the genially animating chirrups that are left; for the grown-up girls, who used to be the warblers supreme of all, when singing over their work without caring for listeners, seem to be now taken up, even before they are young women, with premature questions of fashion, dress, and company; and are, for the most part, only heard in song as evening screechers over the keys of an instrument.

"*As lime increases in bulk three times in the change to a hydrate by the absorption of water during the process of air-slaking, it is necessary, to prevent loss, to buy it by weight and not by measure.*"—page 123.

THE other day Mr. Cottrell introduced into the New York Assembly a bill providing for the establishment by the State Dairy Commissioner of not more than four dairy schools for the purpose of giving instruction to young men and women in the management of dairies, the production of milk, and the science and art of making butter and cheese. It authorizes the Commissioner to hire farms, cows, churns, pans and all other needful dairy implements and appliances. The product is to be sold, and the proceeds to be paid into the State Treasury. The Commissioner is also authorized to appoint an assistant, well acquainted with the chemistry of butter and cheese, who is to superintend the dairy school system, for the support of which an appropriation of $30,000 is provided. Many of the political papers—in their non-agricultural issues, of course—are strongly opposing this measure; but if the farmers really approve of it—and why shouldn't they?—they can certainly secure its passage by making their wishes promptly and emphatically known to their representatives in both branches of the legislature.

WE have seen a number of men working on country roads during the past few weeks. The mild winter has been good for road-making. Last week we saw a gang of men trying to macadamize a road through a swamp. Stones were piled on the frozen surface to the depth of a foot or more and gravel was to be placed on top of these. The road-makers may not know it, but this piece of road-making will result in nothing but a painful failure. The macadam-road is made of stones and gravel, they say. Sure enough! So is a house made of bricks, wood and nails, but unless the bricks, wood and nails are put where they belong, the house will be good for nothing. It is folly to put the stones on the road unless they can rest on a solid foundation. It's true that the frozen ground is solid enough at present, but when the frost comes out, in the spring, the stones will be sure to work out of place and the road-bed will be worse than before. If we are to use stones on the road it is absolutely necessary that we dig out the surface of the road to such a depth that the stones will not be thrown out by the frost. Anything less than this is half-way business and will give less than half satisfaction.

IN the effort to make personal property bear its just share of taxation, the Ohio legislature proposes that the assessors should actually administer oaths as to the real value of the personal property owned by tax-payers. When this plan was tried in England about 200 years ago, the result was that the returns were actually less than before. Is it likely that subterfuge and perjury are more abhorrent to the Ohioans of to-day than to the Britons of two centuries ago? It is marvelous how movable taxable property often disappears. In 1882, 118,286 watches were listed for taxation in the Buckeye State, but in spite of the increase of population and wealth in the interval, only 114,631 were listed in 1887—a disappearance of 3,655 taxable watches in five years! In Hamilton county, consisting mainly of Cincinnati with its city population of about 325,000, the number of watches decreased from 9,283 to 8,659; while in Geauga county with its farmer population of 15,000 or thereabouts, the number had increased from 845 to 922. The same rule applies to pleasure carriages, money on hand, credits and all sorts of personal property. Any moral deductions from such a state of affairs?

NOW, TAKE IT BACK, SIR.

LAST week's R. N.-Y. referred to a person who has industriously circulated the report that our No. 2 potato is really a variety originated by him some four years ago. He now—perhaps from fear of having laid himself open to prosecution—moderates his claim. Still he advises all to *purchase both kinds and try them side by side.* The R. N.-Y. is exercised over this matter for the one reason that both innocent and unprincipled parties may plant and sell the spurious for the genuine R. N.-Y. No. 2, thus causing the confusion and uncertainty necessarily arising from the dissemination of two very distinct varieties under the same name. All seedsmen and others who are interested may readily determine one kind from the other by sprouting one tuber of each in a warm, light room. The sprouts of the No. 2 will be dark purple, nearly black; those of the other green. The price of the No. 2 is $16 a barrel and the entire supply, we are informed, is nearly exhausted. The R. N-Y. has evidence that the person who up to a late date claimed the No. 2 to be one of his seedlings, *knows* them to be entirely distinct. We now call upon him in justice to the R. N.-Y. and to the public, to make an explicit statement to that effect. Otherwise, in due time, we shall publish our evidence and abundantly show his method of seeking to benefit himself at the R. N.-Y.'s expense.

ACCIDENTS AT GRADE-CROSSINGS.

THE large number of accidents due to railroads crossing other roads at grade, so forcibly illustrated in the cartoon in the RURAL of January 7, 1888, has directed the attention of the legislatures of many of the States to the necessity for legislation to do away with this fruitful cause of disaster and death. In 1887 there were 41 persons killed and 57 injured at such crossings in this State, and in 1888 the killed numbered 28, and the injured 34. In the three years ending with 1887 the total number of deaths at the grade-crossings in the single city of Philadelphia amounted to 133; while in the same year the number of deaths in Chicago reached 142, of which 16 occurred in a single month! A special committee appointed, some time ago, by the Massachusetts legislature, in its report just made, shows the great difficulty and expense of altering the existing grade-crossings. Of these there are 2,260 in the Bay State, and the expense of altering them is estimated at $48,131,000. This enormous sum is nearly equal to one-third of the aggregate capital of the 60 corporations that reported to the Commissioners in 1887, and is nearly 90 per cent. of their gross income for that year, while it is six and one-half times as much as they paid in dividends. The Commissioners advise that the making of new grade-crossings should be absolutely prohibited, and that the alterations of the old ones should be made gradually, the dividend-paying roads abolishing five per cent. and the non-dividend-paying roads 2½ per cent. of their crossings every year. Their plan proposes to put the work under State authority and to divide the cost between the railroads and the cities, towns and counties benefited by the change, limiting the tax to be imposed on any community to some fixed proportion of its assessed valuation, and leaving the proportion to be paid by each party to be determined by the circumstances in each case. New York and a considerable number of other States are likely to make laws relating to this matter this year. Whatever concessions may be made to the railroads with regard to crossings at grade already made, the construction of new crossings of the kind should be absolutely forbidden. The aggregate list of killed and wounded owing to this cause every year in the whole country, must be as heavy as that in many an important battle, and no further extension of the evil should be permitted.

AN UNJUST ATTEMPT TO ABOLISH DOWER.

DOWER is the provision the law makes for a widow out of the land owned by her husband, and the word has reference exclusively to real estate. Dower is allowed in all the States except six, and in all the Territories except four. The amount of it is generally a life interest in the use, income and profits of one-third of the husband's real estate; but it varies greatly. In Nevada the widow takes the entire community property after the payment of debts and other obligations; in Washington Territory she takes half the common property, subject to the debts of both; while in Wyoming she takes the entire estate, real and personal, after paying the debts, provided it does not exceed $10,000. In all the States and Territories where dower is allowed, it is necessary that the wife should join in a conveyance of the husband's real estate in order to give the grantee, mortgagee or purchaser, a good title. As a rule, if there is no statement in the conveyance or mortgage that the wife releases her "dower, and right of dower," she can enforce her dower on the death of her husband.

Under existing laws in New York, the wife is assured of one-third interest in any real estate her husband may own at any time after the marriage, and of this she cannot be deprived without her own free consent.

Mr. Eugene F. O'Connor, of Brooklyn, has just introduced a bill into the New York State Senate, which, instead of giving the widow a life estate in one-third of the lands which the husband may own at any time during his married life, provides for giving her the use, income and profits of a third of the lands which the husband owned at the time of his death. The effect of this provision would be to enable the husband to deed away all his real estate at any time during marriage without his wife's consent and free from all claim on her behalf. The husband would be left absolutely free to do what he liked with the land during his life-time without hindrance from his wife.

This bill may be good for the husbands, but it certainly is not good for the wives of the State; nor is it just to the thousands upon thousands of shrewd, earnest, hard-working, helpful wives who have contributed a fair share towards the support of their families and the acquisition of whatever property may have been accumulated. The RURAL NEW-YORKER is strenuously and earnestly opposed to it. It is with no doubtful voice that it calls upon all the wives and other women of the State to join with all the manly husbands, fathers, sons and brothers of the grand old Empire State to see to it that such an unjust law shall never find a place on her statute books.

BREVITIES.

THE Guernsey cow is gaining a reputation as a butter colorer. She is said to be superior to the Jersey in this respect.

ONE of the finest apple orchards the R. N.-Y. has ever seen was mulched every three or four years six inches deep with salt-meadow hay. The hens were turned in periodically to give it a thorough scratching over.

ENTOMOLOGISTS, pray give us a practicable mixture that will kill the flea-beetle. The R. N.-Y. has little hope of raising at the rate of over 700 bushels of potatoes to the acre, if these pests prove as numerous and unattackable as last season.

A GOOD many farmers trace much of the fertility of their farms back to the hog-pen. Every load of manure carried to the field is first worked over by the hogs. The hog-pen is thus the gate to the farm. One can make plenty of manure by this system. Can you make first-class pork as well?

A STRENUOUS move is being made by cattlemen and butchers of Texas, New Mexico, Arizona and Colorado to establish direct communication with meat consumers everywhere, in opposition to the costly system of sending the cattle to Chicago for butchery and meat distribution. As it would give large room for reduction of prices of meat to the eaters, and prevent what would otherwise be a gigantic and overpowering monopoly, it is to be hoped that these Southwesterners will be fully successful.

INTIMACY with nature favors health, strength, happiness and length of life. Adam Dietrick born near Jena, in 1711, was a plain farmer; but so close an observer of plants and plant life as to become a valued correspondent of the botanists of the universities, including Linnæus. His descendants have all been plant lovers. His son Friederick, was Professor of Botany at Eisenach till 82 years of age. His grandson David, was custodian of the herbarium at Jena University until his death lately at 90 years of age. He was vigorous in mind and body to the last, and an especial desire and delight of young students was to have his company on botanical excursions, and this he seldom declined. He knew all about every plant of the region and where to find it.

A BILL now pending in the New York legislature provides for the increase of the salary of the Dairy Commissioner from $3,000 to $5,000 a year. It also gives him and his assistants in tracking "oleo," free access, ingress, egress and regress to and from all places of business, factories, farms, buildings, carriages, vessels and cans in the manufacture and sale of dairy products or any imitation or substitute, together with:

"Power and authority to enter and open any place of business, factory, building, store, bakery, hotel, tavern, boarding house, restaurant, saloon, lunch-counter, place of public entertainment, carriage, car, boat, package, vessel, barrel, box, tub, or can containing or believed to contain articles manufactured, sold, or exposed for sale."

With such ample inquisitorial powers on the side of the law-enforcers, surely the law-breakers should have a slim chance of escaping detection and punishment

A NEW and highly disturbing factor has come prominently into our grain markets. For some time several railroads have been buying grain both as a speculation and for the sake of the addition its transportation would afford to their traffic. It has been done so quietly, however, and to such a moderate extent as to escape general public attention. The Baltimore and Ohio, however, under its new management, has embarked in the business so heavily as to increase the grain trade of the Monument City to an extraordinary extent at the expense of Philadelphia and New York. It is charged that this new departure has been taken, not so much out of railroad greed and need of business as for the private and personal gain of those who run the road. It is believed that the policy is in direct violation of the law, and a demand is made on the Inter State Commerce Commissioners to take prompt and efficient measures against it.

Dairy Husbandry.

MORE BUTTER WINNERS.

LAST week we gave some notes from dairymen who won prizes at the meeting of the Vermont Dairymen at Burlington. Here are a few more:

FROM H. W. WALKER, WINNER OF FIRST PRIZE FOR 10-POUND TUB.

My cows are high-grade Jerseys. They are watered twice a day and are fed morning and noon on Timothy and clover hay, at night on cut corn-fodder. Their grain is 4½ parts corn-and-cob meal, 1½ part bran and one-half part linseed-meal. Of this mixture they are fed, twice per day, four quarts in the morning and four at night. I shall very soon increase the bran to two parts and the linseed-meal to one part.

I use the Cooley creamer. The milk remains in the creamer 24 hours, at a temperature of 42 degrees. The cream is ripened until acid, churned in a Stoddard barrel churn, washed in granular form, and salted in the churn. I endeavor to leave in the butter, after it is worked, one-half ounce to the pound. I use the lever worker, and Thatcher's butter-color. I market in ten-pound boxes lined with dairy cloth.

To produce prime butter after a nice herd of cows is secured, it is imposed upon the workman, in the manufacture, to very carefully watch all the different changes through which the milk, cream and butter have to pass, and to see that all requirements are strictly conformed to in the varied processes. If one point is neglected, the whole work is destroyed or very much impaired.

Windsor Co.

FROM STEPHEN HEWITT, WINNER OF THE SECOND PRIZE FOR FIVE-POUND BOX.

My cows are high-grade Jerseys I give them all they will eat up clean of a good quality of English hay, and a mixture of, say, 500 pounds of Western corn-meal, 100 pounds of cotton-seed-meal, and 300 pounds of wheat bran, fed dry twice a day, in rations of from two to three quarts per feed—in the morning after the hay, and in the evening before the hay, with good spring water. The milk was set in a Stoddard creamer 24 hours, in running water, and the cream was ripened by warming from 12 to 20 hours before churning. It was churned in a Stoddard churn 30 minutes, at a temperature of 66 degrees, and washed while in a granular form, in the churn.

I colored my butter with Wells & Richardson's butter color, using in the cream about three tea-spoonfuls for from 40 to 50 pounds of butter, and I used about three-quarters of an ounce of Higgins's salt to the pound, dry. It was worked with a lever worker just enough to salt it evenly. I pack my butter in five-pound boxes lined with a parchment paper made in Philadelphia I consider it of the utmost importance that the feed and water should be good, and that the stable should be light and airy and moderately warm, and that everything should be quite clean, and the milking quiet.

Windsor Co.

FROM F. D. DOUGLAS, WINNER OF THE SECOND PRIZE FOR FIVE-POUND PRINT.

My cows are mostly grade Jerseys, bred up from grade Short-horn and native stock. I have a few registered Jerseys. I milk usually from 40 to 50, all told; but as I raise my own stock, selling annually such as fail from old age, or do not test satisfactorily, I always have a large proportion of young animals. I raise from 15 to 20 heifers annually, the most promising of which are retained until maturity, and then disposed of, if they do not give satisfactory returns for food and care. My herd last season did not represent over 35 mature cows, estimated by the weight of milk produced by the heifers, as compared with the average of the mature cows. By this estimate, the herd produced an average of over 300 pounds of butter per head.

I manage so that my cows come in, as far as practicable, in September. I raise my own hay and grain, and in favorable seasons buy little but cotton-seed meal. The food ration for my cows in milk is made up of early-cut hay, and a mixture of corn, barley, oat, pea and cotton-seed meal, the proportions depending somewhat upon the amount of each of the four first named produced. I seldom feed more than two quarts of cotton-seed meal per head, per day, never more than three quarts, and it is always mixed with lighter food. The amount of the grain ration depends upon the flow of milk given at the time, the deepest milkers receiving the most. Two and three-year-old heifers get but one-half to two-thirds as much as mature cows. I find that every judicious increase of the grain ration, up to the point where the digestive organs begin to be over-taxed, is followed by increased profits, provided always that the cow is worth keeping.

The grain ration is always divided into two feeds, and placed upon the hay. I do this to compel the cows to eat it slowly, and thus secure a more perfect mastication and complete mixture with the saliva. This first step in the process of digestion is an important one. Injury to stock from heavy feed is often caused by want of attention to this matter.

The cream was raised by the original "deep-setting" process brought out by myself in 1868, usually called the Douglas method. This method attracted much attention at the time, but as no patents were secured upon any of the devices used in connection with it, and no effort was ever made to introduce it, it has never been extensively adopted. By this system, the milk is set 12 inches in depth, at a temperature of 63 degrees theoretically, though, practically, at a range of temperature from 61 to 66 degrees. By this system, a more perfect separation of the cream is secured, with a much smaller consumption of ice, with much less labor throughout the entire process, and with better keeping qualities in the butter product, than by any other process of cream raising yet devised.

The butter was churned in a Mosely & Stoddard barrel churn. It required about 30 minutes to churn the batch from which the sample was taken; but with batches of from 150 to 175 pounds, it usually requires from 45 to 60 minutes. It is churned by horse-power, and the duration of the churning depends somewhat upon the number of revolutions per minute. It was washed and salted while in the granular state, particular pains being taken not to allow it to mass until after the salt was thoroughly incorporated in it. It was then worked sufficiently to expel the brine, using pressure rather than a grinding process. It was colored but slightly, with Wells & Richardson's butter-color.

Windsor Co.

SHALL DAIRYMEN COMBINE?.—Yes, combine Thatcher's Orange Butter Color with your cream every month in the year and you will advance the price of your butter. This is the best combination.—*Adv.*

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

ALL the shops are now displaying their spring goods, although New York is far from balmy, as far as the weather is concerned. Among the newer fabrics are what our mothers used to know as Grecian lustres, now called brilliantines. They are very soft and fine, with a lustrous, silky gloss. They suggest Irish poplin, but are finer. There is no doubt they will make very useful and handsome summer gowns, for they throw off dust, and wear a long time. A black brilliantine, trimmed with black and white surah, would make a serviceable summer gown for a woman who expects her one best dress to serve for some time. A large hat or small capote of black lace would go with it. The hat might be trimmed with for-get-me-nots or violets, the latter being the most fashionable flower at present. Another handsome gown could be made of pearl-gray brilliantine, trimmed with white or silver braid, the ornamentation consisting of a braided vest and skirt panel.

* * *

MOST girls like a nice white muslin for hot days. White frocks of all-over embroidery have been almost done to death; one may display more style with less elaboration. A pretty model is somewhat of the Directoire style, fine India linen being the material preferred. The gathered skirt is perfectly plain; and no bustle is worn, only a small pad. The plain, round waist has a falling-over frill about two inches deep around the neck and down the front. The sleeves are full and puffed, about three-quarters length; a frill about four inches wide finishes them. A wide sash, which may be of muslin, is worn, tied in the back—in the front it is pulled out to double the width at the sides, and held in place with ornamental pins. This is very becoming to a slender figure. A surah sash, either moss green, golden green, dull yellow, or pale terra-cotta, is lovely on the white gown. Pale blue ribbons, which used to be the ambition of most girls with their white gowns, are now rather out of date. Lavender or lilac is very pretty, and seems growing in favor; but it is a color that fades too soon to be very serviceable. A pretty addition to a white muslin frock is a hat of shirred white mull, either a poke or a flat Directoire. It is not difficult to make, and may be trimmed either with a bow of ribbon or a bunch of flowers. It is becoming to most youthful faces, and may often be contrived at small expense, as a means of saving a better hat.

* * *

SUMMER is certainly a season for economy in dress. One may contrive a sufficiency of changes at a small expense. Cotton fabrics are coming more into wear every year, as they increase in beauty. A very convenient summer garment is a flannel blouse waist. It can be worn with so many different skirts, being comfortable enough for warm days if desired, while in chilly weather it may be worn either with cotton or woolen skirts. The color must be chosen with some idea of harmony; plain cream-white goes with anything, but it is naturally very easily soiled. English girls are very fond of these blouses in different shades of red. They come in pretty mingled stripes also. Of course, a handy woman can make one of these garments easily enough They have full sleeves with deep cuffs, just like those on a boy's shirt, except that the cuffs do not button. They have a large, flaring sailor collar, the open space at the neck being filled up by a plastron with a high collar. This plastron is hooked into place, so that it may be moved if desired, the place being filled with a gay silk handkerchief or fichu by way of change. For country excursions one of these blouses, worn with a plain flannel skirt and little sailor hat, makes the prettiest and most suitable costume a girl can wear. A pretty combination may be made with a gray and pink striped skirt of tennis suiting and a plain gray blouse with striped collar and cuffs.

* * *

ONE cannot answer all the questions a child asks; but an intelligent interest in what he wants to know will teach observation; it makes all the difference between eyes and no eyes. When a child comes in exclaiming over the dear little pussy-willow, it is no trouble to admire it with him, and to tell him that the pussy is the blossom. It is the same with everything else; the child whose mother encourages powers of observation in this way is always better informed than one whose treasure is greeted with "Don't bring that mess in here! I don't know what it is." Everything in nature is wonderful to children; thrice happy are they whose country homes enable them to find "tongues in the trees, sermons in stones, books in the running brooks, and good in everything."

A LETTER FROM EUNICE WEBSTER.

WHAT a fight is being made over that Thanksgiving cartoon, and, like the rest of belligerent humanity, I want a hand in it. I wonder if J. H. G. thinks that women ought to be three steps lower when it comes to a fight. Probably it would depend on whether he thought he could whip his opponent on a level.

How much we read or hear to the effect that man and wife are one; but it seems in many cases that they are two, or ought to be according to J. H. G. viz., the "supreme ruler" and the "chief cook." J. H G. would like to know why so many women are "always and eternally" dissatisfied with their positions in life. I'd like to know why so many men are "always and eternally" afraid that a woman will have an idea or venture to undertake anything without first pleading, on bended knees, for the sanction of some pantalooned biped with regard to the matter. If women ought not to figure prominently in out-door scenes, why didn't the artist put her on the piazza? Such a position would have been nearer "the music of the tea-kettle." According to J. H G's views, perhaps it would have been still more appropriate to have her looking out of the kitchen door or window, admiring instead of sharing in the scene. I wonder if J. H. G. thinks a woman ought to figure in the milking stable. That would be quite distant from "the music of the tea-kettle," and she wouldn't be in her realm either; but perhaps he would condescend to accept her assistance in order to humor her, or make her think she is of some use to him.

I wonder why an apron was put on that woman. Probably after the voices of the cattle and swine had ceased to fill her ears with their rich melody, she went back to "the music of the tea-kettle." Maybe she thinks she will have to clean up the yard when the barnyard choir has retired from the scenes. I wonder which choir she likes best—that in front, or the one that is gathered around the family?

It seems that all the animals and the family can sing without a book; or perhaps there was only one and, of course, the leader and head of the house must have that. Perhaps he wouldn't dole out money enough for her to have one, too. As the man is the real and only head of the family (or ought to be according to J. H. G.), why doesn't he go and do all the trading for the family, instead of trusting the "chief cook" with the money he sees fit to dole out to her? Besides, she would be out of hearing of "the music of the tea-kettle" while she was gone for some cloth for his shirts and some necessary articles for the family use. There is a very self sacrificing man around here, who goes to the city every fall and gets himself a nice suit, and for his wife he gets some limpsey cotton fabric, and then wonders why her dresses don't look like those of the rich folks. Truly, we "chief cooks" admire such thoughtfulness, and if the "supreme ruler" comes home drunk, swears, abuses us, and spends his money on other "chief cooks," surely we ought to be contented with "the music of the tea-kettle" and our positions generally. If "the lord and master" doesn't spend all before he dies, we can have the use of one-third of what is left, and if he is thoughtful he will select some black cotton fabric, so that we'll not have to go to any extra expense in case that time should soon come

THE GOSSIPS' CLUB.

A DOZEN ladies in the widely-spread little village of B—, have formed a woman's club, the design of which is not by any means a new one In order to nip in the bud the criticism of husbands who might be inclined to sarcasm, they have called it "The Gossips' Club" They do not claim that it is for mutual improvement, and there is not the slightest pretence made to the study of Shakespeare or Browning, or Emerson. The only requirement for membership is a promise that the candidate will never take the floor when another woman has it, that she will bring work, either fancy or useful, and that when the club is held at her house, only tea, coffee or chocolate, and wafers shall be served. There is a fine of 25 cents for the first offence and 50 for the second; said offence to consist in mentioning the name of a neighbor coupled with any remark that the speaker would not make if the other person were present. Peculiar rules and restrictions for a gossips' club, thought I when invited to join, mentally deciding that I would go and learn what these remarkable women would talk about.

After a few preliminary remarks about the health of their children, etc., the ladies settled down to their work. Now, thought I, either some one will be kept busy collecting the fines, or there will be awkward pauses. I was, however, so agreeably disappointed in the intellectual status of my sex that I will mention some of the subjects discussed at this meeting.

"Did it ever occur to you," began Mrs. A—, a lovely, white-haired lady of 50, "that women plan too much? As head of the house, we decide upon a certain system and method which we carry out though we may walk rough-shod over the habits and propensities of every other member of the family. That the washing shall be done on Monday is a law as inexorable as that of the Medes and Persians. It has taken me a good many years to discover it, but I have learned that there is such a thing as too rigid an adherence to a plan that may have been a very good one originally. If in the morning you portion out a certain amount of work that you wish to accomplish before night, and then find your plans upset by inevitable little mishaps, you are very apt to feel annoyed, and if you were very much bent indeed upon carrying out the plan, your annoyance will amount to an irritation of feeling that will not be slow in communicating itself to the rest of the family. One of the best managers, with the happiest families, and the best ordered house, that I know of, tells me that her rule through life has been: 'Whatsoever thy hand findeth to do, do it with thy might.' She says her duties so unfold themselves from hour to hour, that she never feels the necessity for making plans ahead"

"The education of our daughters," said another lady whose apparent occupation was the making of a set of crocheted table mats, "is a subject that must always be dear to every mother's heart. Children need a certain amount of letting alone, but they also need our care and guidance, and a certain amount of culture. They are the plants which God has given to us and we must prevent them from being choked by weeds. I think that every girl, no matter how happy her home or how rich her parents, should be taught some vocation that will enable her to make a living if necessary. A man if he be in any sense manly, will not care the less for his wife because he feels that she is able to care for herself and if he is not manly, she may care for herself whether she is able or not. Two years, after a girl has finished her studies, will be

sufficient to instruct her in any of the dozen or more trades or professions for some one of which she will almost certainly develop an aptitude. In Europe the sons and daughters of some kings and queens are taught trades. A woman who is a skilled engraver, stenographer, or nurse, or who understands telegraphy, book-keeping or dentistry, will never suffer for means of support. Then, too, if the years intervening between leaving school and marriage, are filled with the pursuit of some useful study, there will be fewer temptations. It is the girl who has nothing to do but dress, flirt and visit with her companions, who so often brings sorrow to the hearts of her parents."

Mrs. C. found the scarcity of woman's pockets a matter for immediate legislation. "Miss Anthony," said this staunch supporter of woman's rights, "has condensed a long statement of the woes and inabilities of woman into the one glaring fact that she has not pockets enough. The only pocket which fashion allows us, is so secreted that it is only at the expense of a disjointed collar bone or a curved spine, that we can make daily and hourly use of it. We are obliged to make use of muffs, a corsage or satchel, and I have seen women on shopping expeditions stow away small articles in the crowns of their round hats. We carry change in our gloves, and I have seen ladies, not over-particular, secrete small silver in their mouths. A sensible writer who sees no reason why a pocket should disturb either the symmetry of style or a lady's gown says a very fascinating design for a pocket of very bulky dimensions capable of carrying the house keys, the scraps for memoranda, unpaid bills, the 67 different samples to be matched, the addresses of a few dear friends and the lady's pin-money, can be made of an alligator skin extension to the corsage, either pendent on the outside of the skirt along the line of the waist belt, and tastily decorated with wide apple-green ribbons, or attached to the inside of the skirt and supported by wire attachments similar to those in a hoop-skirt. These designs are just as cute as anything the dressmaker can devise.

A pretty cynic brought up the matter of so-called "society;" for you must know that this little village of B. is noted for its fashionable lunches and receptions. There is no greater beauty or elegance of dress to be found in the adjacent metropolis than that which assembles at its charity ball. The cheerfulness with which its great ladies spend a hundred or many hundreds of dollars on a toilet for this ball for charity's sake, gives evidence of the beautiful spirit in which they carry out the words of our Saviour: "Inasmuch as ye have done it to one of the least of these, ye have done it unto Me."

My fair cynic, however, took exception to the present state of society, and asked what was gained by undertaking to make and receive formal visits from people of whom you know little and you care less, and whom for the most part you do not even wish to see? Why if a woman can count upon the fingers of one hand all the people she really wishes to see and know, should she pretend to want to see and know others? Why when she makes her tedious round of calls, does she breathe such a sigh of relief when the servant says, "Not at home"? I often think of a question I once saw in an article in Harper's, "If all the artificial rounds of calls and cards should tumble down, what valuable thing would be lost out of anybody's life?" Out of some lives everything would go, for, strange as it may seem, this same artificial round is the "life" of some people. Did you ever stop to analyze a fashionable "At Home," for instance? Fifty or a hundred people crowded together, each without anything special to say to any one else, but each trying to say it in a Babel of noises that compels her to raise her voice like a fish-woman. Conversation in an ordinary tone would be impossible. No one hears the music. No one hears anything that does her any good. All wander round in an aimless sort of fashion, go out to supper, sip bouillon, eat pâtés and croquettes, salads, cake, cream and fruits, bid their hostess adieu, and say, "What a charming time we have had," and go home with this lie on their lips, for I do not think so ill of my sex as to believe that one woman in 20 really enjoys this sort of thing.

There were practical "gossips" on housewifely thoughts intent, who exchanged ideas of worth on the domestic machinery, but of these I must tell you at some future date.

ALICE CHITTENDEN.

GOLDEN GRAINS.

As the Pittsburgh Advocate says, what a wonderful sense of peace comes to those who, far from human friends and in the midst of desolation, realize the truth of the Master's words, "Lo I am with you alway!" There are certain phases of religious experience which we cannot know until we find the presence of the Redeemer in an apparently empty world.....

Dr. Collyer recently preached from the text, "Live joyfully with the wife whom thou lovest." He said there is no question of deeper moment than that which many are asking now with sinking heart, and reading about in the returns of the divorce courts, Is marriage a failure, and if so what then? We love to think that husband and wife stand for more than father or mother or children, because they are the fountain-head. We have to wonder, however, whether the new generation are not looking on marriage as a sort of rollicking holiday business, because they feel that if they like, they can throw off the yoke and run free.....

We must teach and you must learn, young friends, that the truest and best wedded life can bloom only out of the best and purest unwedded life. The remedy lies not in any doctrine of go-as-you-please, nor finally in the enactments of the law, which cannot reach the root and heart of the evil; nor does it lie in the church, but with you and me and yours and mine, and in this shall we be pioneers. Only to the pure are all things pure. Only to the true, loving heart are all things possible. All true love is blent with reverence, as heavenly light is blent with heavenly dew....

The Texas Advocate says that if you can live gently, patiently, unmurmuringly, amid all your frets and irritations, day after day—that is heroism. That is your task. You are to resolve to do it. No one, not even God, will do it for you. Heaven does not put features of beauty in our lives as the jeweler sets gems in clusters. The unlovely elements are not drawn out and replaced by lovely ones, like slides in the stereopticon. You must win your way through struggles to all noble attainment. It is he that overcometh that is made a pillar in God's temple..... .....

The Richmond Advocate says we have been witness to a sermon served like an ox roasted whole—horns, hide and hoofs. It was weighty. There was inertia of avoirdupois. The cooked carcass, stuffed with extracts from countless commentaries and classic criticisms, offended rather than invited to a banquet. A single sirloin brought out brown, with the juice bound up with the crust, would have tempted the palate and nourished more than the huge mountain of beef..... .....

Napoleon is reported to have said that he feared the newspapers more than a thousand bullets.....

Wendell Phillips was a living example of his statement that no man really believes his own opinions who does not give free scope to his opponent. Persecution is a want of faith in our creed.....

Isaiah Strong says ancient civilization was sedentary and contemplative; ours is active and practical. In point of experience, results, acquisitions, enjoyment and sorrow—in all that makes up life, save the mere factor of time, the antediluvians were the children, and the men of this generation are the aged patriarchs.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

Proverbs 25—32: "He that refuseth instruction despiseth his own soul, but he that heareth reproof getteth understanding."

It occurs to me that one of the worst misfortunes that some of us fall into is that of setting too high a value on our own opinions. "A *little* knowledge is a dangerous thing!" We see almost daily evidences of the truth of this old saw. Almost every smatterer misjudges his own powers, and believes that he knows about three times as much as he really does. In every class that graduates from our Normal Schools or our colleges we find men and women who might well serve as models for the person described in the text.

"He that refuseth instruction despiseth his own soul." People of this kind are narrow, superficial and bigoted. They have memorized a great many books and can repeat their lessons glibly. This makes them believe that they have fully mastered what they have studied, and we get a class of dogmatic men and women who go through life so eager to pick out and criticise the little, insignificant mistakes they discover that they render themselves incapable of grasping large ideas or developing large, kindly hearts or broad, generous natures.

This world has now been in operation for a good many years and several billions of people have been adding from year to year the results of their thinking and investigation to the store of knowledge. Years ago when books and papers were practically unknown, it was quite possible for the fortunate few who could obtain access to the secrets of the learned to be dogmatic and overbearing in their assumption of wisdom. Wisdom in those days was simply a trade secret. It is impossible, for example, to conceive of any man in this age who could, by his superior knowledge of chemistry, acquire such a power as that possessed by the men who knew the secrets of Greek Fire in the Middle Ages—or the first uses of gun-powder later on. Yet almost any of our modern chemists knows more than these old fellows ever dared to dream about. Thus we see that if there was any sense in this old proverb at the time it was written, there is double sense in it now. I believe it to be a fact that the more a man investigates and digs at the root of a subject, the greater respect he has for the opinions of others and the more perfectly developed in him are the charity and kindly feeling that go so far to hold the world together and make society truly strong.

Now just a word about the second part of the text. "He that heareth reproof getteth understanding." It is a characteristic of your "know-it-all" friend that he never can consider himself deserving of reproof. Speak to him ever so kindly about his faults and he feels insulted at once. This is a very unfortunate condition to fall into. Next in value to a fair and candid friend is the ability to take a criticism or a reproof in the proper spirit.

Going to other persons and telling them our opinions about their faults or mistakes is not at all a nice business to be in for the man or woman who attempts to cultivate any refinement of feeling, and yet there can be no doubt but that a good square bit of fault-finding, earnestly and forcibly expressed, will sometimes prove the kindest and most considerate thing we can do for a friend.

There are different ways of finding fault, different methods of reproof. One who would do it in the way calculated to bring the best results, must study his friends. Any teacher of ordinary discernment must know that it requires a variety of punishments in order that a reproof may bring understanding regarding the rules of the school. The coarse, rough, brutal boy may need his reproof in the shape of a whipping; while the little girl, conscientious and faithful, might cry her eyes out at a sharp word or a stern reproof. As a rule, we all need somebody to "keep us straight." The people who can gauge their own conduct just right and who are not helped by a little friendly criticism are mostly too good for this world If a man has good friends upon whom he can rely, I don't know but it is a good plan for him to depend upon them a little for rules of conduct.

We cannot get much "understanding" from reproof administered by a stranger, although I can conceive of a case where a blunt and forcible criticism from an unknown person might set one to thinking in a way that would lead to good results.

* * *

I have always felt that the rudest shock to our sensibilities, or the bitterest stroke of misfortune might be considered as a reproof from which we may gain "understanding," if we will only look at it in the right way. Some people only grow sour and bitter and hateful in the face of repeated misfortunes; others grow patient, with a deeper trust and a larger hope. It seems to me that to each one is given, to a certain extent, the power of taking reproof or misfortune in either of these two ways.

* * *

The man who has no friends, who is simply so unlovable that others would sooner be away from him than with him, may be said to be preparing for himself a life that will be simply horrible in its loneliness. While he has vigor and energy and unimpaired powers of body and mind he may get on very well with his own thoughts and his own estimation of himself; but when he reaches the summit of life and begins to walk down the other slope! Good, true, sound friends who take an interest in one's welfare and can give the kindly sympathy, the disinterested advice and the generous criticism—are there any better influences with which one can be surrounded?

How are these friends secured—how is the generous and helpful friendship picked up? Why should we feel impelled to think and work for the comfort and pleasure of one person while we must be impelled by some strong stimulant before we can bring ourselves to come to the help of another? What is the cost of friendship? This world must be made up of equal bargains. Nature never intended to give something for nothing, and she never will do it.

Friendship is based upon gratitude—the golden rule. It is the warm, generous nature who delights in doing good, who is constantly on the lookout for a chance to perform little kindnesses and courtesies, who never stops to consider the cost or inconvenience to himself when a chance for being polite or useful offers itself—such is the one who attracts friends and feels a pleasure in attracting them, that is keen beyond all expression. Such a nature is well worthy of cultivation.

CONCERNING LIGHT, CUSHIONS, AND RATS.

MARY WAGER-FISHER.

There is a pretty story told of the late Emperor William of Germany in connection with kerosene. When the lamps for burning this oil were first introduced into the living-rooms of the palace, the Emperor, when leaving his apartment in the evening, turned down his lamps in order to economize in the oil burnt. When he returned, he found his room pervaded with an unwholesome odor, and upon inquiry, his servant told him that it came from turning low the wicks of the kerosene lamps, and that it should not be done.

"Then, I will not use them," exclaimed the Emperor. "My mother taught me always to turn low the wick of my lamp when not needing the light, and I would not willingly forego the practice of her economical training. So take these new-fangled lamps away!"

Since then there have been lamps of all sorts for burning this coal oil, and people have learned either to blow out the lamp, or to use a small night lamp for full burning, when leaving the room for a length of time. But one of the greatest troubles with the use of these lamps, is the care and breakage of chimneys. Not long ago all the chimneys of the student lamps in the house snapped into flinders, and I audibly expressed the wish that there were lamps that would burn without chimneys, whereupon Anaximander described one he saw lately in Seattle, Washington Territory, in the house of an ex-army officer, which had been used for many years in his family with entire satisfaction. It burned without a chimney, gave a fine, odorless light, was wound up like a clock, and could be used also as a stove for cooking. All these qualities especially fitted it for camp life. But the name of this lamp, and where it could be had, he did not know.

Some days later, however, upon returning from his office in the evening, he was encumbered with a package which he deposited upon the library table, remarking:

"M—— came into my office to-day, and brought me this lamp, which burns without a chimney, and is probably a descendant of the lamp I saw in Col. H's house in Seattle."

"And what is this curious metallic thing, which looks like the bonnet of a Salvation Army woman?" I asked.

"That's a shade to be used with it, and that other contraption fits on top, for the coffee pot, if you wish to make coffee or tea.'

"And what's this key for, down at one side?" asked the laddie. "Why there's something inside going! I can hear it when I put my ear close!"

"That key winds up machinery inside, which propels a fan, and I don't know how to stop it. But I will fill it with oil and start it going. M—— says half a pint of oil will feed it for six hours, and give a 50-candle-power light; that it can't explode, or break, or smoke"—and paterfamilias proceeded to fill and light the prodigy. When it was lighted, the room was flooded with a light of peculiar brilliancy and clearness.

"Oh that's boss!" cried the laddie. "That's like sunlight!"

Then the S. A. bonnet was put on, shading one side only of the flame, so that by turning the shade, light or shadow could be turned on any part of the room. One could sit in the shadow and still have the light fall on his book or work.

"The great thing about this lamp," said Anaximander "is that the combustion of the oil is perfect, and there can be neither smoke nor odor. The little fan inside explains the

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

whole business, feeding the flame with air. See what a white flame it is!" And during the whole evening we were profuse in our expressions of admiration of the new lamp which seemed to be faultless. A—— knew nothing of its origin, nor where it could be had, but stamped in the electroplated body of the lamp was, "Wanzer Lamp." When we went out to dinner, the red wick, about one inch across, was turned low, to see what would be the result. When we returned, no odor was perceptible.

"If this lamp continues to behave in this fashion, we'll have no other henceforth," I said, as visions of its multiplicity of uses rose before me. All that was more than a month ago, and the opinion first formed of that wonderful lamp has not in any degree been modified, but fully confirmed. We prefer it vastly to any lamp in the house for reading, and we have also the Rochester lamp which gives an excellent light. In fact I do not see how the lamp can be improved upon in its effect, and it certainly cannot be expensive, as lamps go. My only object in writing in detail of it, is to make the fact known to RURAL readers, that such a lamp has been invented and manufactured, and is probably on the market or will be, and it is so economical in oil, such a salvation for the eyes, such a saving of money and of labor in glass chimneys, and a lamp that can be turned to so many noble uses, no word of praise can be too emphatic in regard to it. One must wonder, if such a lamp was invented years ago, why it did not become at once generally known. Of the mechanical part of the lamp I cannot speak; but, judging from the longevity of its ancestor in Col. H's family, it is to be inferred that the machinery which drives the fan inside, is simple in construction and not easily worked out of order. None of it appears to view and the external appearance of the lamp is in no way peculiar and it admits of being made as handsome and fanciful as one could desire. The only thing about it that does not entirely please me, is the name on it. Wanzer is German, and the name should be that of a Yankee—some good old New-England name. But whoever be the inventor, blessed be his name, for he is a benefactor of the human race.

I ripped apart an old cushion lately that was a family heirloom, a cushion that I always liked, for it was a solid, settled sort of cushion, that kept its shape and never had to be shaken and patted into an orderly form, so I was curious to see if there was anything peculiar in the feathers worn by geese or hens 50 years ago. When I had it open, there lay the contents, a mass of feathers and carpet-rags so interlaced and matted together as to be almost inseparable; evidently feathers were scarce at the homestead when that cushion was made, and the equal proportion of carpet rags well mixed, filled the cushion case to the desired plumpness I thought it a method well worth repeating.

As we have lately been sorely pestered with rats—too smart by far to be caught by cats or traps—a gentlewoman sent me word to catch a rat in a wire trap which would make of him a prisoner; then to keep him in the trap until he starved to death, when all the other rats would leave and never in their lifetime return. We haven't tried this plan, because the would-be-vicarious rat does not enter the trap, and, then, how could one deliberately starve even a rat to death! The world is sadly out of joint in one way, one set of animals killing another set in order to live comfortably. With all due respect to Leviticus, Chapter 11th, I never felt that I had a moral right to take the life of anything which enjoyed life.

"The barren life, so soon as its barrenness is absolutely hopeless, becomes a literal death."

OVERHEARD.

"MISS C. *is* homely, that's a fact. But what a pity it is that she doesn't know enough to dress in black or dark colors at least. It would improve her looks 50 per cent. That bright green dress that she is wearing this winter intensifies her natural sallowness and seems to sharpen her features. It certainly is too bad that with a moderately well-filled purse she should clothe herself so unbecomingly."
